Chicago, Ill., in 1856, and there built up a mission Sunday school with more than 1,000 pupils. He subsequently built a church in Chicago, which was destroyed in the great fire in 1871, but was afterward rebuilt under the name of the Chicago Tabernacle. In 1873 he began, with Ira D. Sankey, the evangelistic work which soon made him famous. He met with unparalleled success both in the United States and Great Britain. In 1879 he founded a school for poor girls at Northfield, Mass., which later grew into the celebrated Northfield and Mount Hermon institutions. It is said that during his ministry Mr. Moody addressed over 50,000,000 people. He died in Northfield, Mass.

Moore, Sir John, 1761-1809. A British military officer; born in Glasgow, Scotland; he served in Nova Scotia, Corsica, and Holland; as brigadier-general in the West Indies, 1796; in Ireland during the rebellion of 1798; in Holland in 1799, and in Egypt in 1801. Moore was then regarded as the greatest living British general, and in 1805 he was knighted. In 1808 he was appointed commander-in-chief of the British army in Portugal to operate against Napoleon. He advanced to Salamanca in spite of the gravest difficulties, but was finally compelled to retreat to Corunna, a distance of 250 miles, in face of a superior force. The absence of a fleet to receive his army forced him to a battle against Marshal Soult, in which Moore fell, mortally wounded, in the hour of victory.

More, Sir Thomas, 1478-1535. English statesman and philosopher; educated at Oxford; entered Parliament, 1504; produced "History of Richard III." 1513, published 1557; "Utopia," 1516; became a great favorite of Henry VIII., who made him lord chancellor in 1529; being an ardent Catholic, he refused to sanction the divorce of Queen Catherine, and resigned his office in 1532; imprisoned in 1534 for declining to take an oath acknowledging the validity of the king's marriage to Anne Boleyn, and executed the same year for denying the king's supremacy as head of the church.

Morgan, John Pierpont, 1837-. . . An American capitalist; born in Hartford, Conn.; was educated at the University of Göttingen, Germany. He returned to the United States in 1857, and became connected with the banking firm of Duncan, Sherman & Co. In 1871 he was made a partner of the firm of Drexel, Morgan & Co., which afterward became J. Pierpont Morgan & Co. He became widely known as an organizer of large railroad and industrial interests. Mr. Morgan has been a large donor to charitable and educational institutions.

Morris, Gouverneur, 1752-1816. An American statesman; born in Morrisania, N. Y. He was member of the Continental Congress; of the committee that drafted the Constitution; minister to France, 1792-1794; U. S. senator from New York, 1800-1803. He died in Morrisania.

Morris, Robert, 1734-1806. An American financier, and a signer of the Declaration of Independence; born in Liverpool, England. Coming to America at an early age, he embarked in mercantile business in Philadelphia, and rapidly acquired wealth. On the outbreak of the Revolution, he took a prominent part in upholding the national cause. In 1776, he was elected to Congress, and in 1781 appointed superintendent of finance. He died in Philadelphia, Pa.

Morse, Samuel Finley Breese, 1791-1872. American inventor of the magnetic telegraph; graduate of Yale College; studied painting in England, returning to America in 1832; constructed small recording electric telegraph in 1835; finally obtained aid from Congress in 1843, and constructed a line between Washington and Baltimore in 1844.

Morton, James Douglas, Earl of, 1580-1581. Regent of Scotland; joined the Reforming party; was made Chancellor; took part in the murder of Rizzio, and was privy to the plot against Darnley; joined the confederacy of the nobles against Mary, fought against her at Langside, and became regent in 1572; became unpopular; was charged with being accessory to Darnley's murder, and beheaded.

Moses. In Scripture the Hebrew lawgiver and leader of the Israelites from Egypt; born in Egypt; died on Mount Pisgah, at the age of 120 years.

Mott, Lucretia, 1798-1880. An American reformer; born in Nantucket, Mass. In 1818 she joined the Friends. In 1833 she assisted in the formation of the American Anti-Slavery Society, and in 1840 went to London as its delegate to the World's Anti-Slavery Convention. She was one of the four promoters of the Woman's Rights Convention in the United States, and was an active exponent of the cause of equal suffrage. She died in Philadelphia, Pa.

Moultrie, William, 1781-1806. An American military officer; born in South Carolina. In 1776 he was designated to construct a fort, which afterward received his name, on Sullivan's Island; was promoted a major-general by Congress; in 1785 he was elected governor of South Carolina, and again in 1794, after which he retired to private life. He died in Charleston, S. C.

Mozart (mo-zart'; Ger., mo'tsart), Johann Chrysostomus Wolfgang Amadeus, 1756-1791. German composer; composed short pieces at the age of six, and at seven gave concerts in Paris and London; distinguished for the universality of his genius; he gave artistic form to opera.

Muhlenberg, Henry Melchior, 1711-1787. Founder of the German Lutheran church in America.

Muhlenberg, John Peter Gabriel, 1746-1807. American general.

Müller, Friedrich Max, 1823-1900. A German philologist; born in Dessau, Germany; son of Wilhelm Müller, the German poet. He was the author of "A History of Ancient Sanskrit Literature," "On the Origin and Growth of Religion as Illustrated by the Religions of India," etc. He died in Oxford, England.

Munchhausen, Baron von, 1720-1797. A cavalry officer in the service of Hanover, famed for the extravagant stories he used to relate of his adventures and exploits, which, with exaggerations, were collected by one Raspe, and published in 1785 under Münchhausen's name.

Munkacsy, Michael, 1844-1900. A Hungarian painter, whose real surname was Lieb; born in Munkacs, Hungary. In 1872 he settled in Paris. He visited New York in 1886. Except a few portraits, his works are nearly all genre pictures. He died in Bonn, Germany.

Murillo, 1617-1682. A celebrated Spanish painter; born at Seville; his subjects were drawn partly from low life and partly from religious or scripture themes, such as the "Immaculate Conception" and the "Assumption of the Virgin," as well as "Moses Smiting the Rock," the "Miracle of the Loaves and Fishes," etc.; died from a fall from a scaffold while painting an altar-piece at Cadiz.

Murray, James Stuart, Earl of, 1533-1570. A natural son of King James V. of Scotland; he was chief minister of his half sister, Mary Queen of Scots, and became regent on her deposition; was assassinated.

Na' dir Shah, 1688-1747. A Turkish chief; given command of the Persian army, 1729; he defeated the Afghans and in 1736 usurped the Persian throne. Overrunning Afghanistan and capturing Delhi, 1739-1739, he massacred many inhabitants of that city; was assassinated.

Nansen, Fridtjof, 1861-. . . A Norwegian scientist and explorer; born in Great Froen, near Christiania, Norway. In 1893, with a crew of eleven men, he set sail from Christiania for the polar regions, and reached a point about 272 miles from the pole; he was appointed Curator of Anatomy in the University of Christiania.

Napier, Sir Charles James, 1722-1858. English general; born at Whitehall; served in the Peninsular War; was in 1841 made commander-in-chief of the Bombay army; defeated the Sikhs at Mianee in 1843 in a brilliant engagement; became governor of Sindh. Having returned to England, he died at Portsmouth.

Napier, John, 1550-1617. A Scotch mathematician, the inventor of logarithms; born in Merchiston, near Edinburgh, Scotland; traveled on the Continent, and ultimately settled down at the family seats of Merchiston, near Edinburgh, and Gartness, in Stirlingshire, as a recluse student, where he died.

Napier, Robert, Lord, 1810-1890. An English military officer; born in Ceylon; was made commander-in-chief of the British army sent out to Abyssinia for the rescue of the English captives held there by its semi-barbarous ruler, King Theodore; raised to the peerage as Lord Napier of Magdala, and also made a Knight Grand Cross of the Star of India; in 1869 he was appointed commander-in-chief of the British Indian army; and governor of Gibraltar in 1876; he died in London, England.

Nash, John, 1752-1835. English architect; born in London; was the architect of Buckingham Palace and the Pavilion at Brighton.

Nash, Richard, 1874-1961. Known as "Beau Nash"; born at Swansea, Wales; installed himself as master of the ceremonies at Bath, and ruler of the assemblies of fashion in that resort; died in poverty but was honored with a public funeral.

Naat, Thomas, 1840-1902. An American artist; born in Landau, Bavaria; he is best known for his political cartoons, which were of great influence in the various

political campaigns, and were effective in the exposure of the "Tweed ring"; in 1902 he was appointed United States consul at Guayaquil, where he died of yellow fever.

Nebuchadnezzar, 626-562 B.C. King of Babylon; captured Jerusalem in 606 and carried away many captives, including the prophet Daniel; afterward took Tyre, and reduced Egypt.

Necker, Jacques, 1782-1804. An eminent French financier and statesman; born in Switzerland; he was father of the celebrated Madame de Staël.

Nelson, Horatio, Viscount, 1758-1805. The greatest of Britain's admirals; entered the navy at twelve; captain, 1779; rear admiral, 1797; took a prominent share in the victory of St. Vincent; lost his right arm in an unsuccessful attack on Tenerife; won the battle of the Nile in 1798, for which he was raised to the peerage as Baron Nelson of the Nile; became separated from his wife, owing to his infatuation with Lady Hamilton, which lasted until his death; created a viscount for the victory of the Baltic, where, being second in command, he disobeyed the orders directing him to retreat; fell at Trafalgar, where his fleet gained a decisive victory over the French and Spanish; his last words, "Thank God, I have done my duty."

Nesselrode, Count von, 1780-1862. Celebrated Russian diplomatist; born at Lisbon; represented Russia at a succession of congresses, played a prominent part at them, and directed the foreign policy of the empire under Alexander I. and Nicholas I., from 1816 to 1856.

Neuville, Alphonse de, 1836-1886. French painter of battle scenes; born at St. Omer; he was an illustrator of books, among others Guizot's "Histoire de France."

Newman, John Henry, Cardinal, 1801-1890. English theologian; recognized leader of the High Church party until 1845, when he became a Catholic; appointed rector of Catholic University at Dublin, 1854, and made a cardinal by Pope Leo XIII. in 1879.

Newton, Sir Isaac, 1642-1727. English philosopher; the son of a farmer; graduated at Cambridge, 1665, about which time he invented the "method of fluxions," and discovered the laws of gravitation; discovered, 1666, that light is not homogeneous, but consists of rays of different refrangibility.

Ney, Michel, Duke of Elchingen and Prince of the Moskwa, 1769-1815. French marshal; the son of a cooper; entered the army at eighteen as a private, and was gradually promoted; Napoleon called him "the bravest of the brave," and his titles were conferred upon him for his services at Elchingen, in 1805, and his victory at the battle of Borodino; commanded the rear guard in the retreat from Moscow; defeated by Bülow at Dennewitz, 1813; submitted to Louis XVIII. upon the abdication of Napoleon, against whom he was sent with an army in 1815, but united his army with that of his old commander; had five horses shot under him at Waterloo, where he fought with his usual valor; was captured soon after, and shot on a charge of treason.

Nicholas I., 1796-1855. Emperor of Russia; third son of the Emperor Paul I.; born near St. Petersburg, Russia. He ascended the throne in 1825. He made war with Persia, 1826-1828; joined in the treaty of London, which secured the independence of Greece; and made one of the allied powers who destroyed the Turkish fleet at Navarino in 1827. This affair led to war between Russia and Turkey, in which the latter was defeated. Early in 1852 began the Russian effort to take over the holy places and assume the protectorate of the Christians in Palestine. This led to the Crimean war, before the close of which Nicholas died from lung disease in St. Petersburg.

Nicholas II., 1868-. Emperor of Russia; son of Alexander III.; born in St. Petersburg, Russia. His mother was the Princess Dagmar, a daughter of the king of Denmark. During the famine of 1891 he was, at his own request, made president of the Committee of Succor, and worked hard in the organization of relief. As czarévitch he held several military commands in his own country—in the famous Preobrajensky regiment among others—and in England he had conferred on him in 1893 the Order of the Garter. He succeeded to the throne November 1, 1894. He married the Princess Alix of Hesse-Darmstadt November 26, 1894. His coronation took place with impressive and elaborate ceremonial at Moscow in May, 1896. Nicholas II. originated The Hague Peace Conference, and is understood to be strongly opposed to war.

Nicot (ne-ko'), Jean, 1580-1600. French diplomatist; born in Nîmes, France; was French ambassador at Lisbon; introduced into France the tobacco plant, having obtained its seeds from a Dutchman, who obtained them

from Florida; it was called after him Nicotiana. Died in Paris, France.

Nightingale, Florence, 1820-. . . . An English philanthropist; born in Florence, Italy. During the Crimean War she promptly volunteered to organize a select band of nurses at Scutari. The offer was accepted by the British War Office, and within a week Miss Nightingale was on her way to the East, where she rendered invaluable service. She was consulted during the American Civil War and the Franco-German War. She published "Notes on Hospitals," "Notes on Nursing," "Notes on Lying-in Institutions."

Nobel, Alfred Bernard, 1833-1896. A Swedish chemist and physicist; born in Stockholm, Sweden. In 1868 took out a patent for the manufacture of an explosive composed of nitroglycerin and ordinary blasting powder, and in 1864 a second patent. In 1867 he invented dynamite; in 1876 gelatinous nitroglycerin; in 1889 ballistite, which led the way to the invention of smokeless powder. Invented also artificial gutta-percha; manufactured cannon, and, with his brother, Louis, developed the petroleum deposits at Baku, in the Caucasus. He lived for a long time in Paris, but had a villa and laboratory at San Remo, Italy, where he died. Nobel left his fortune of \$9,200,000 to found a prize fund, the annual interest of which was to be divided into five equal parts (each amounting to about \$40,000, the sum available), to be distributed every year to the persons who, during the year, had done best in (1) physical science; (2) chemistry; (3) physiology or medicine; (4) idealistic literature; and (5) the advancement of universal peace.

North, Frederick, Eighth Lord North and Second Earl of Guilford, 1732-1792. An English statesman; became a lord of the treasury in 1759; chancellor of the exchequer and leader of the House of Commons in 1767; and prime minister in 1770. He was largely responsible for the measures that brought about the loss of the American colonies.

Noyes, George Rapall, 1798-1868. An American Biblical scholar; born in Newburyport, Mass. In 1840 he was made professor of Hebrew and Oriental Languages and Dexter lecturer on Biblical Literature at Harvard. Besides many reviews and sermons, he published new translations, with notes, of several books of the Old Testament. He died in Cambridge, Mass.

Oates, Titus, 1649-1705. Fabricator of a popish plot for the overthrow of the Protestant faith in England, the allegation of which brought to the block several innocent men; rewarded at first with a pension and safe lodgment in Whitehall Palace, was afterwards convicted of perjury, flogged and imprisoned for life, but at the revolution was set at liberty and granted a pension.

Oberlin, Jean Friedrich, 1740-1826. A benevolent Protestant pastor; born at Strasburg; labored all his life at Ban de la Roche, a wild mountain district of Alsace, and devoted himself with untiring zeal to the spiritual and material welfare of the people.

Ockam or Oakham, William of, 1280-1349. An English scholastic philosopher; born at Ockham, Surrey; surnamed *Doctor Inevincibilis*; studied under Duns Scotus and became his rival, and a reviver of Nominalism in opposition to him, by his insistence on which he undermined the whole structure of scholastic dogmatism.

O'Connell, Daniel, 1775-1847. Irish patriot and orator; advocated Catholic emancipation, but opposed resort to arms; elected to Parliament, 1828, but not allowed to take his seat until 1829, when the bill for Catholic emancipation was passed; gave up his law practice and gave his entire attention to public duties; began advocating the repeal of the union in 1841; was convicted in 1844 on a charge of sedition, but sentence was reversed by the House of Lords.

Octavia, 70?-11 B.C. The sister of Augustus; a woman distinguished for her beauty and her virtue; was married first to Marcellus, and on his death to Mark Antony, who forsook her for Cleopatra.

Odovacer, 434?-493. The first barbarian king of Italy; son of one of Attila's officers; was assassinated.

Oecolampadius (ek-o-lam-pa-di-us), Joannes, 1482-1531. One of the leaders of the Reformation; born at Weinsberg, in Würtemberg; became preacher at Basel; assisted Erasmus in his edition of the New Testament; entered a convent at Augsburg; came under Luther's influence and adopted the reformed doctrine.

Oersted (air-sted), Hans Christian, 1777-1851. Danish natural philosopher; founder of the science of electro-magnetism.

Ofenbach, Jacques, 1819-1880. A musical composer;

born at Cologne, of Jewish parents; distinguished the *opéra bouffe* from other opera; was the author of "La Belle Helene," "Orpheus aux Enfers," "La Grande Duchesse," "Madam Favart," etc.

Oglesby, Richard James, 1824-1899. An American lawyer; born in Oldham county, Ky.; promoted major-general in the Civil War; he was eleven years governor of Illinois, being first elected in 1864, re-elected in 1872, and again in 1884; he was elected United States senator in 1878 and served six years; died in Elkhart, Ill.

Oglethorpe, James Edward, 1696-1785. An English military officer and philanthropist; born in London, England; it was through his efforts that a colony was formed of insolvent debtors and persecuted Protestants, whom he brought to the United States and settled in Georgia. In 1733; he remained in the United States till 1743, when he returned to England; he died in Cranham Hall, Essex, England.

O'Higgins, Bernardo, 1776-1842. A Chilean general and statesman; son of Ambrosio O'Higgins; born in Chillan; was a prominent leader of the Chilean patriots in 1810, and in 1818 was made commander of the army; in the conflict with Spain in 1814 the forces of O'Higgins were defeated at Rancagua and they fled across the Andes; O'Higgins joined San Martin in the invasion of Chile and a few days after their victory at Chacabuco (Feb. 12, 1817) he was made supreme dictator of Chile; the rule of O'Higgins was an excellent one; he was forced to resign by a revolution and retired to Peru, where he died.

O'Leaphant, Laurence, 1829-1888. English author and traveler; born at Cape Town; spent his boyhood in Ceylon; he married one Alice l'Estrange, an alliance which grew into one of the most intimate character; with her he went to Palestine, pitched his tent under the shadow of Mount Carmel, and wrote two mystical books under her inspiration.

Olmsted, Frederick Law, 1822-1903. An American landscape architect; born in Hartford, Conn. In co-operation with Calvert Vaux he prepared the general design for Central Park in New York. He was also consulted regarding the park systems of Boston, Chicago, Buffalo, and other cities, besides the United States Capitol grounds and terrace.

Omar Pasha, 1806?-1871. A Turkish general; born in Plaski, Turkey. On the invasion of the Danubian Principalities by the Russians in 1853, he collected an army of 60,000 men, and crossing the Danube in presence of the enemy, intrenched himself at Kalafat, where he successfully withstood the Russians; February 9, 1855, he embarked for the Crimea, and repulsed with great loss 40,000 Russians who attacked him at Eupatoria. In September, 1861, he was charged to pacify Bosnia and Herzegovina, which were in insurrection. This being accomplished he attacked the Montenegrins, captured Cetinje, and overran the country in 1862.

Orange, William, Prince of (the Silent), 1533-1584. Founder of the Dutch republic; leader of the insurrection which broke out when it was attempted to introduce the Inquisition into the Netherlands; assassinated.

Orellana, Francisco de, 1497-1545? A Spanish explorer; born in Truxillo, Spain; came to Peru in 1535. Ambitious of adventure, he set out to explore the continent of South America east from Peru; passed down a branch of the Amazon into that vast river, and thence to the sea; thus being the first European navigator of the Amazon. His accounts of the marvelous country he had crossed induced Charles V. to authorize him to settle colonies there, and he returned for that purpose in 1544, but died soon after his arrival.

Orfila (or-le-fah), Mateo Jose Bonaventura, 1787-1858. A French physician of Spanish parentage, and the founder of the science of toxicology; born in Mahon, Minorca. His "Treatise on Legal Medicine" is the greatest work on medical jurisprudence extant.

Origen, 186?-253. Greek theologian and preacher; endeavored to harmonize the teachings of Christ and Neo-Platonism.

Orleans, Louis Philippe Joseph, Duc d', 1747-1793. Took the popular side on the assembling of the States-General, renounced his titles, and assumed the name of *Egalite* (Equality); voted for the death of his cousin, Louis XVI.; condemned by the revolutionary tribunal and executed; his son, Louis Philippe, afterward became king of the French.

Oryloff. The name of two brothers, Russians: **Gregory, 1734-1788,** the favorite of Catherine II., and **Alexis, 1737-1809,** a man remarkable for his stature and strength, who murdered Peter III. and was banished by Paul I.

Ossi'n, Felice, 1819-1858. Italian conspirator; with

three others attempted the life of Louis Napoleon; was defended by Jules Favre, but condemned to death and guillotined.

Oscar I., Joseph Francois Bernadotte, 1799-1859. King of Sweden and Norway; son of Bernadotte (Charles XIV.); born in Paris, France; he acceded to the throne in 1844; he took little part in foreign politics; he resigned in favor of his eldest son in 1857.

Oscar II., 1829- . . . King of Sweden and formerly of Norway. He is grandson of Napoleon I.'s famous general, Marshal Bernadotte, the first king of the new independent kingdom of Norway. He ascended the throne in 1872, in succession to his brother, Charles XV. He married, in 1857, the Princess Sophia of Nassau, by whom he had four sons.

Osceola, 1804?-1838. A chief of the Seminole Indians; born in Florida. In 1835, while on a visit to Fort King, his wife was claimed as a slave, as being the daughter of a fugitive slave woman, and carried off as such. Osceola resolved upon vengeance, and some months afterward, finding General Thompson outside of the fort, killed him and our other whites in his company; he was seized and kept in confinement at Fort Moultrie till his death.

Othman or Osman I. (surnamed the Conqueror), 1259-1326. The founder of the empire of the Ottoman Turks; born in Bithynia.

Otho (o'toe), 32-69. Roman emperor; had been a companion of Nero; was created emperor by the Pretorian Guards in succession to Galba, but, being defeated by the German legionaries, stabbed himself to death after a reign of three months.

Otis, James, 1725-1788. An American statesman; born in West Barnstable, Mass. Through his efforts the Stamp Act Congress was assembled in 1765. He was the author of a number of political essays and orations. He died in Andover, Mass. He had a leading part in animating the American people to a defense of their liberties.

Otterbein, Philip William, 1726-1818. Founder of the Church of the United Brethren in Christ; born at Dillenburg, Nassau, Germany; came as missionary to America in 1752; was a powerful preacher, and started a great revival in 1766. He did not separate formally from the German Reformed Church, but labored for a revival of religion in the existing religious bodies, along with Rev. Martin Boehm, a Mennonite, and long his associate in revival work. He ordained one preacher of the new society.

Oudinot (oo-de-no'), Duke of Reggio, 1767-1847. Marshal of France; born at Bar-le-Duc; protected the retreat from Moscow, and was wounded; joined the Royalists after the fall of Napoleon, and died a member of the Chamber of Peers.

Owen, Sir Richard, 1804-1892. Celebrated English naturalist and comparative anatomist; born in Lancaster.

Ox'enstierna, Axel, Count, 1583-1654. Swedish statesman; favorite minister of Gustavus Adolphus; supported him through the Thirty Years' War, though he disapproved of his engaging in it, and managed the affairs of the state with great ability after his death.

Packard, Alpheus Spring, 1839-1904. An American naturalist; born in Brunswick, Me. He is best known as an entomologist; his classification of insects, proposed in 1863, has been generally accepted.

Paderewski, Ignace Jan, 1859- . . . A celebrated pianist; born at Podolia, in Russian Poland; made his debut in 1887 with instant success; his first appearance created quite a furor in Paris and London; has several times visited the United States.

Paganini, Nicolo, 1782-1840. A phenomenal Italian violinist; he was extremely profligate.

Paine, Robert Treat, 1731-1814. An American jurist; signer of the Declaration of Independence; born in Boston, Mass.; was a delegate to provincial and continental congresses, and held offices of attorney-general of Massachusetts and judge of the Supreme Court; was an able judge. He died in Boston.

Pakenham, Sir Edward Michael, 1778-1815. An English military officer; born in Ireland; he commanded the British expedition against New Orleans in 1814; he led the British bravely in the battle of New Orleans, January 8, 1815, and was killed while urging on his men.

Palestrina, Giovanni Pierluigi da, 1524-1594. Celebrated composer of sacred music; surnamed the Prince of Music; born at Palestrina; produced a number of masses which at once raised him to the foremost rank among composers; was the author of the well known *Missa Sanctificatus*.

Paley, William, 1743-1805. Born at Peterborough,

England; held various church preferments; was archdeacon of Carlisle; was a clear writer and cogent reasoner on common sense lines; author of "Horns Pauline," "Evidences of Christianity," and "Natural Theology," as well as "Moral and Political Philosophy."

Palfrey, John Gorham, 1796-1881. An American clergyman and author; born in Boston; was pastor of Brattle Street Unitarian Church, Boston; professor in Harvard; secretary of state of Massachusetts; and member of the Anti-Slavery Congress at Paris in 1867; his enduring work is "The History of New England"; died in Cambridge, Mass.

Palissy (pah-lis-say), Bernard, 1508?-1589. A French potter and chemist; born in Agen; his pottery has become celebrated and few things are more prized by the connoisseur than the famous "Palissy ware"; being a Protestant, he was arrested by the Leaguers toward the end of the reign of Henri III., and died in the Bastille.

Palladio, Andrea, 1518-1580. An Italian architect; born at Vicenza, of poor parents; was precursor of the modern Italian style of architecture; his works, which are masterpieces of the Renaissance, consist principally of palaces and churches.

Pallas, Peter Simon, 1741-1811. A German traveler and naturalist; born in Berlin; professor of Natural History in St. Petersburg; explored Siberia; and contributed to the geographical knowledge of the Russian empire.

Palma, Tomas Estrada, 1835- . . . A Cuban statesman and soldier, called the "Franklin of Cuba"; born in Bayamo, Santiago de Cuba. On December 31, 1901, he was elected first president of the new Cuban republic, according to the constitution adopted by the Cuban national convention. His administration has been conservative and successful.

Palmer, John McAuley, 1817-1900. An American lawyer; born in Eagle Creek, Scott county, Ky.; served with distinction in the Civil War, retiring in 1866 with the rank of major-general; U. S. senator in 1890. In 1896 he was the candidate of the Gold Democrats for president of the United States. He died in Springfield, Illinois.

Palmerston, Henry John Temple, Viscount, 1784-1865. English statesman; born, of an Irish family, in Hampshire; succeeded to his father's title, an Irish peerage, in 1802, and entered Parliament in 1807 as member for Newtown, Isle of Wight; in 1852 joined Lord Aberdeen's coalition ministry, and on its fall became himself prime minister in 1855; he prosecuted the Crimean war and the Chinese war of 1857, and suppressed the Great Mutiny in India; he was prime minister when he died.

Pao'li, Pasquale de, 1725-1807. A Corsican patriot; sought to achieve the independence of his country, but was defeated by the Genoese, aided by France, in 1768; took refuge in England; returned to Corsica and became lieutenant-general under the French republic; raised a fresh insurrection, had George III. proclaimed king, but failed to receive the viceroyalty, and returned to England, where he died a disappointed man.

Papin, Denis, 1647-1714. French physicist; born at Blois; made a special study of the expansive power of steam and its motive power, invented a steam-digester with a safety-valve, since called after him.

Pappenheim, Count von, 1594-1682. Imperial general; born in Bavaria; played a prominent part in the Thirty Years' War; was mortally wounded at Lützen.

Paracelsus, 1493-1541. A Swiss physician, alchemist, and mystic, whose real name was Theophrastus Bombastus; born at Einsiedeln, in Schwyz.

Paré (pa-ray), Ambroise, 1517-1590. Great French surgeon; born at Laval; was, from the improved methods he introduced in the treatment of surgical cases, entitled to be called, as he has been, the father of modern surgery. His writings exercised a beneficent influence on the treatment of surgical cases in all lands.

Paréna-Rosa, Madame (Euphrosyne Parepa de Boyesku), 1836-1874. A British operatic singer; born in Edinburgh; first appeared in England in 1857 and in the United States in 1865. Her voice was a soprano of great power and compass and she was greatly admired in oratorio singing; she died in London.

Park, Mungo, 1771-1806. A distinguished Scottish African explorer; perished while on his second expedition in the African wilds.

Parker, Alton Brooks, 1832- . . . Formerly chief judge of the Court of Appeals of New York; born in Cortland, N. Y.; educated in the public schools, in Cortland Academy and Cortland Normal School; was admitted to the bar, and practiced at Kingston; was surrogate (Judge of probate) of Ulster county, 1877 to 1885;

delegate to Democratic National Convention, 1884, when Grover Cleveland was nominated for president; in 1886 was offered the office of first assistant postmaster-general; was chosen chairman of the Democratic State Executive Committee in that year, and was also elected, the same year, Justice of the Supreme Court; member of the Court of Appeals, Second Division, 1890 to 1893; member of the General Term, Appellate Division, 1893-1897; chief judge 1898-1904; Democratic presidential candidate, 1904.

Parker, Matthew, 1504-1575. Archbishop of Canterbury; born in Norwich; in 1544 he was appointed master of Corpus Christi College, Cambridge, and elected vice-chancellor of that university the following year; when Queen Mary succeeded to the throne Parker was deprived of his offices, and remained in concealment till the accession of Elizabeth in 1558; by royal command he was summoned to Lambeth, and appointed archbishop of Canterbury.

Parker, Theodore, 1810-1860. An American theologian; born in Lexington, Mass.; he was chosen, in 1837, minister of a Unitarian congregation at West Roxbury; visited Europe in 1843; the prejudice against him led to his quitting West Roxbury, and settling at Boston in 1846, as minister of the Twenty-eighth Congregational Society; he distinguished himself as the fearless opponent of the Fugitive Slave Law and sheltered slaves in his own house; early in 1859 he was compelled to relinquish his duties and seek health in France and Italy; he died in Florence.

Parnell, Charles Stewart, 1846-1891. An Irish statesman; born at his father's estate of Avondale, Wicklow county, Ireland. His mother was the daughter of Admiral Stewart of the United States navy. Became member of Parliament in 1875; organized the "active" Home Rule Party, and developed its obstruction tactics; he died in Brighton, England.

Parthasius (par-ray-she-us), flourished 400 B. C. A gifted painter of ancient Greece; born at Ephesus; went to Athens and became the rival of Zeuxis; he was the contemporary of Socrates.

Parry, Sir William Edward, 1790-1855. Celebrated Arctic explorer; born at Bath; visited the Arctic Seas under Ross in 1818; conducted a second expedition himself in 1819-1820; a third in 1821-1823; a fourth in 1824-1826, with unequal success, and a fifth in 1827 in quest of the North Pole.

Pascal, Blaise, 1623-1662. Illustrious French thinker and writer; born at Clermont, in Auvergne; was distinguished at once as a mathematician, a physicist, and a philosopher; an accident which befell him turned his thoughts to religious subjects, and in 1654 he retired to the convent of Port Royal where he spent as an ascetic the rest of his days, and wrote his celebrated "Provincial Letters" in defense of the Jansenists against the Jesuits, and his no less famous "Pensees," which were published after his death.

Pas'ca, Judith, 1798-1865. A famous Italian operatic singer; born near Milan, of Jewish birth; her celebrity lasted from 1821 to 1832, after which she retired into private life; she had a voice of great compass.

Pasteur (pas-ter'), Louis, 1822-1896. A French chemist and physicist; born in Dole, Jura; was especially successful in proving the part played by microbes in fermentation and decomposition, in introducing a successful treatment of diseases in silkworms and cattle, and achieved great success in his efforts to check hydrophobia by means of inoculation. He died in Paris.

Patrick, Saint, flourished fifth century. The apostle and patron saint of Ireland; his birthplace uncertain; his mission, which extended over great part of Ireland, was eminently successful. Various miracles are ascribed to him, and among the number the extirpation from the soil of all venomous reptiles.

Pat'li, Adellina Maria Clorinda, 1843- . . . A popular operatic singer of Italian extraction; born in Madrid, Spain. Her debut in London took place in 1861, and she was ever afterward looked upon as one of the first singers of the day. Her residence is Craig y Nos Castle, Wales.

Pattison, Mark, 1813-1884. A distinguished English scholar; born at Hankswell, Yorkshire; became rector of Lincoln College, Oxford; his chief literary work, a "Life of Isaac Casaubon."

Paul, Saint (originally called Saul), flourished first century. The great Apostle of the Gentiles; born at Tarsus, in Cilicia; by birth a Jew and a Roman citizen. He did more for the extension, if not the exposition, of the Christian faith at its first promulgation than any of the Apostles, and perhaps all of them together, and it is

questionable if but for him it would have become, as it has become, the professed religion of the most civilized section of the world.

Pausanias, . . . 469 B.C. A famous Spartan general, who, as a commander-in-chief of the Greeks, overthrew the Persian army under Mardonius at Platea in 479 B.C.

Peabody, George, 1795-1869. Philanthropist; born at Danvers, now Peabody, Mass.; made a large fortune as a dry goods merchant in Baltimore and as a stock-broker in London; gave away for benevolent purposes in his lifetime more than eight million dollars; died in London.

Peale, Charles Wilson, 1741-1827. American writer and artist; born in Maryland; he attained distinction as a portrait painter and naturalist; died in Philadelphia.

Peale, Rembrandt, 1778-1860. An American artist; born in Bucks county, Pa.; when seventeen years old, executed a portrait of Washington, from whom he had three sittings; a later portrait was purchased by Congress; he died in Philadelphia, Pa.

Pearry, Robert Edwin, 1856- . . . An Arctic explorer and civil engineer in the United States navy; born in Cresson, Pa.; he made a number of voyages to the Arctic regions, returning from the last in 1902; reached lat. 84° 17' N.

Peel, Sir Robert ("Orange Peel"), 1788-1850. English statesman; repealed the corn laws.

Penn, William, 1644-1718. An eminent member of the Society of Friends, who received a grant of Pennsylvania from the English Crown in payment of a debt owing his father, and led the colony which founded Philadelphia; born and died in England.

Pepin (The Short), 714?-768. A king of the Franks; the first of the Carolingian kings. He assisted Pope Stephen III. against the Lombards; defeated the Saxons, Bavarians, and other German nations, and united Aquitaine to his crown. After a reign of sixteen years, he died in St. Denis. His son Charlemagne succeeded him as king of the Franks.

Pepys, Samuel, 1633-1703. An English author; secretary to the admiralty in the reigns of Charles II. and James II.; born in London; his title to fame rests upon his "Diary" (1660-1669), which is a most entertaining work, revealing the writer's own character very plainly, giving an excellent picture of contemporary life, and of great value for the history of the court of Charles II.

Pericles, 495?-429 B.C. Athenian orator, statesman, and general; became the leader of the democratic party and the first man in Athens; erected many noble public works, including the Parthenon; his age is called "the golden age of Athens." Democratized Athens.

Perry, Oliver Hazard, 1785-1819. An American naval officer; born in South Kingston, R. I.; famous for his defeat of a British force on Lake Erie in 1813; died of yellow fever in Trinidad, and was buried at Newport, R. I.

Perugino (*pay-roo-jé'no*), **Pietro**, 1446-1523. An Italian painter; born in Leitta Della Pieve. His real name was Pietro Vanucci. He was employed for ten years in the Sistine Chapel and the Stanze of the Vatican, and on his return to Perugia opened a school, and had Raphael among his pupils. His best work is the "Pieta," in the Pitti Palace.

Pestalozzi (*pes-ta-lot'sé*), **Johann Heinrich**, 1746-1827. A Swiss philanthropist and educational reformer; devoted his time and substance to training children whom he collected in large numbers in his own house, and this good work he carried on for over five years. Later he opened a school in the Castle of Yverdun (canton Vaud), which the government had placed at his disposal. His novel "Lienhardt und Gertrud" exerted a powerful moral influence, while his educational treatises have laid the foundation for the more rational system of elementary instruction which now obtains in America and Europe.

Peter . . . -64? The Greek surname of an apostle of Jesus. Peter's real name was Simon, his father's Jonas, his brother's Andrew. Peter was of an impulsive temperament, generous, but too forward in speech, and rash in action. After the Ascension, he was for a time the most prominent of the apostles. Tradition makes him die as a martyr at Rome, crucified with his head downward. Roman Catholics claim him as the first bishop of Rome, and consider that the authority delegated him by Jesus appertains also to his successors, the popes of Rome.

Peter I. (the Great), 1672-1725. Czar of Russia and founder of the modern Russian monarchy; organized an army; studied practical seamanship, and formed a

navy; traveled *incognito* in Western Europe; worked as a ship carpenter in Holland; founded schools and effected a number of reforms; defeated Charles XII. of Sweden, at Poltava, 1709; founded St. Petersburg; his second wife, Catherine, was a prisoner of war, of obscure parentage; the crown prince, Alexis, opposing the czar's policy, was thrown into prison, and is said to have been poisoned by his father, though it is probable he died from the effects of torture.

Peter the Hermit, 1050?-1115. Preacher of the First Crusade.

Phidias, 490-432 B.C. The greatest of Greek sculptors, and architect of the Parthenon; he was never excelled in expressing the ideal majesty of the human form, and his Zeus, at Olympia, is counted among the wonders of the world.

Philip II., 332-336 B.C. King of Macedonia; father of Alexander the Great.

Philip II. (Augustus), 1165-1223. King of France; annexed Normandy, Anjou, and Lorraine; won the battle of Bouvines.

Philip IV. (the Fair), 1268-1314. Reduced the power of the feudal nobles; imprisoned Pope Boniface VIII. and caused him to remove his seat to Avignon; suppressed the order of Knights Templars. **Philip VI.** (of Valois), 1293-1350.

Philip II., 1527-1598. King of Spain; son of Charles V.; provoked insurrection in the Netherlands by his attempt to introduce the Spanish Inquisition; married, on the death of Mary Tudor, his second wife, Isabella of France, the betrothed of his son, Don Carlos; equipped the "Invincible Armada" for the conquest of England.

Phillip, . . . -1676. Sachem of the Wampanoag tribe of Indians; was the second son of Massasoit, who for nearly forty years had been the first and staunchest ally of the Pilgrim settlers of Plymouth, and had obtained English names for his two sons; in 1661 Philip succeeded his brother, and formally renewed the treaties of his father, which he kept for some years; during the progress of King Philip's War this sachem was slain and his head cut off.

Phillips, Wendell, 1811-1884. Slavery abolitionist and emancipationist generally; born at Boston, Mass., and bred to the bar; was Garrison's aid-de-camp in the cause, and chief after his death.

Phips, or **Phipps**, **Sir William**, 1651-1695. Governor of Massachusetts; born in Pemnaquid (Bristol), Me.; in 1687 recovered from a wrecked Spanish ship off the Bahamas bullion plate and treasure valued at \$1,500,000; this gained him a knighthood and the appointment of sheriff of New England; in 1690 he captured Port Royal (now Annapolis) in Nova Scotia, but failed in the following year in a naval attack on Quebec; in 1692, through the influence of Increase Mather, he was appointed governor of Massachusetts.

Phocion (*fo'khe-on*), 402-317 B.C. A distinguished Athenian general and statesman; opposed to the democracy of Athens, led on by Demosthenes in the frantic ambition of coping with Philip of Macedon and his son Alexander, and pleaded for a pacific arrangement with them; but having become implicated in intrigues against Polysperchon, he was accused of treason and condemned to drink hemlock.

Piccolomini (*pit-ko-lo'me-nee*), **Ottavio**, 1559-1656. Austrian general; conspirator against Wallenstein; gained great distinction in the Thirty Years' War; led Spanish army in Flanders.

Pickering, Timothy, 1745-1829. An American statesman; born in Salem, Mass. He participated in the battle of Lexington; in 1776 joined the Continental army, in command of 700 men; was soon appointed adjutant-general by Washington; in 1780 was selected for the post of quartermaster of the army; he was secretary of state under Presidents Washington and Adams, but was dismissed during the "X. Y. Z." papers dispute in 1800. He retired from politics for a time but was elected to the United States Senate in 1804, and from that time continued active in politics until 1817. He died in Salem.

Pierce, Franklin, 1804-1869. An American statesman; fourteenth president of the United States; born in Hillsboro, N. H. In 1833 he entered Congress, serving four years, and in 1837 was elected to the United States Senate. In 1846 he enlisted for the Mexican War; was appointed brigadier in the volunteer army, and led his brigade in the battles of Contreras and Churubusco. In 1852 he was nominated for the presidency, and elected over General Scott. During his administration the Missouri Compromise was annulled a reciprocity treaty for trade with the British American colonies was made; a

treaty with Japan was established, and the Mexican boundary disputes settled. After his term expired, failing of a renomination, he traveled abroad for three years, and, returning, lived thereafter in retirement at Concord, where he died.

Pierrepont (*peer-pont*), Edwards, 1817-1892. An American diplomatist; born in North Haven, Conn.; he was elected a judge of the Superior Court of New York in 1857; in 1875 he became attorney-general of the United States in Grant's administration, and in the following year was appointed United States minister to Great Britain. He tried many famous cases during his professional career, and was noted as an orator. He died in New York city.

Pilate, Pontius, . . . -37? A Roman ruler, who became governor of Judea, 26 A. D.; he commanded in that country ten years; the Jews brought Jesus Christ before Pilate, who, perceiving that envy and malice occasioned their charges, would have scourged the prisoner and dismissed him, but, being threatened with the wrath of Cæsar, Pilate delivered Jesus, whom he pronounced innocent, to be crucified.

Pinckney, Charles Cotesworth, 1746-1825. An American statesman; born in Charleston, S. C.; he was Washington's aid-de-camp at the battles of Brandywine and Germantown; member of the convention that framed the Constitution of the United States; declined the secretaryship of war in 1794, and of state in 1795; in 1796 he was sent as minister to France; in 1804 and 1808 he was an unsuccessful Federalist candidate for the presidency.

Pitman, Benn, 1822- . . . An American phonographer; born in Trowbridge, England; brother of Sir Isaac Pitman, the inventor of phonography; came to the United States in 1853, and founded the Phonographic Institute in Cincinnati; invented the electro-process of relief engraving in 1856; was military recorder of state trials during the Civil War.

Pitman, Sir Isaac, 1813-1897. An English stenographer; born in Trowbridge, England; he was the inventor of the phonetic system of shorthand writing and published his first treatise on the subject entitled, "Stenographic Soundhand" in 1837; he was the head of the Phonetic Institute at Bath, and was identified with the spelling reform.

Pitt, William, 1759-1806. An English statesman and orator; son of the earl of Chatham; born in Hayes, England; was elected to Parliament in 1780; head of the great coalition against Bonaparte; in 1783 he became prime minister; was active in the negotiations of peace with the United States, and was instrumental in the passage of many important measures; he died in Putney, England.

Pius IX. (Giovanni Maria Mastai Ferretti), 1792-1878. Chosen to the pontificate, 1846; during his incumbency the dogmas of the immaculate conception and of papal infallibility were promulgated, temporal power overthrown, 1870, and the papal states annexed to Italy.

Pizarro, Francisco, 1470-1541. Spanish conqueror of Peru.

Plato, 428-347 B. C. Greek philosopher; disciple of Socrates; held that the human soul has always existed, and that an idea is an eternal thought of the divine mind; Emerson says, "Plato is philosophy, and philosophy is Plato."

Pliny (the Elder), 23-79. Roman naturalist; perished at an eruption of Vesuvius.

Pliny (the Younger), 62?-116. Roman orator and author.

Plotinus, 205-270. Greek Neo-Platonic philosopher.

Pocahontas, 1595?-1617. Daughter of Powhatan; saved the life of Captain John Smith, an English explorer; was converted to Christianity, and married an Englishman named Rolfe.

Polk, James Knox, 1795-1849. American statesman; eleventh president of the United States; born in North Carolina; removed to Tennessee; admitted to the bar; Congress, 1825; speaker for two terms; governor of Tennessee, 1839-1841; elected president on the Democratic ticket, holding that office from 1845-1849.

Polk, Leonidas, 1806-1864. Episcopal bishop and Confederate general; prominent at Shiloh and Stone River.

Polo, Marco, 1252-1323. A distinguished Italian traveler and writer; noted for his journey to China.

Polycarp, Saint, 69-155. Bishop of Smyrna; martyr.

Pombal, Sebastiao Joze de Carvalho, Marquis de, 1699-1782. An eminent Portuguese statesman; as prime minister he abolished the Inquisition, expelled the Jesuits and gave liberal encouragement to commerce and manufactures.

Pompey (the Great), 106-48 B. C. Roman general and triumvir; conquered Sertorius and Mithridates; became leader of the aristocracy and opponent of Cæsar; defeated at Pharsalia.

Ponce de Leon, Juan, 1460-1521. Spanish discoverer of Florida.

Poniatowski (*po-ne-ah-tov'ske*), Joseph, Prince, 1762-1813. A Polish general; born in Warsaw, Poland. On the defeat of Kosciuszko, Poniatowski sought refuge in Vienna. When the French entered Warsaw in 1806, he was appointed to the command of the Polish army which was to co-operate with the French against Russia. Napoleon estimated his services so highly that shortly after the battle of Leipzig he created him a marshal of France.

Fontaine, 1720?-1769. Chief of the Ottawas; formed coalition of Indians against the whites, and attempted to capture Detroit.

Porter, David Dixon, 1813-1891. An American admiral; born in Pennsylvania. He commanded the *Florida*, 1862, which reduced Forts Jackson and Saint Philip, on the Mississippi below New Orleans.

Powers, Hiram, 1805-1873. An American sculptor; born in Woodstock, Vt. In 1835 he went to Washington; two years later he was enabled to go to Italy to study his art, and he resided in Florence till his death. There he produced his statue of "Eve," which excited the admiration of Thorwaldsen, and in 1843 the still more popular "Greek Slave," of which six copies in marble, with cast copies innumerable, were produced. Among the other works the chief were "Proserpine," "I Penseroso," "A Californian," "An American," and a bust of Washington for the state of Louisiana, of Calhoun for South Carolina, and of Daniel Webster for Boston, as well as of John Q. Adams, Andrew Jackson, Marshall, Van Buren, and other distinguished Americans. He died in Florence, Italy.

Powhatan, 1550?-1618. An Indian chief; was the father of Pocahontas, who is celebrated in the colonial history of Virginia as the rescuer of John Smith.

Praxiteles, 360?-280 B. C. A celebrated Greek sculptor; executed several fine statues in bronze and marble, of Bacchus, a satyr, Venus, and Apollo. Of his work the "Hermes of Olympia" is the only original example extant. He excelled by the grace, tenderness, and finish of his works. He was esteemed as second to Phidias only.

Priestley, Joseph, 1733-1804. A Socinian divine; born in Yorkshire; wrote in defense of Socinianism, and in defense of Christianity; gave himself to physical research, particularly pneumatic chemistry; is the discoverer of oxygen; sympathized with the French Revolution; was mobbed, and had to flee to America, where he died.

Prim, Juan, 1814-1870. A Spanish general; distinguished as a statesman; rose to be minister of war, but aspiring to dictatorship, was shot by an assassin.

Ptolemy (*tol'-e-mee*) (Claudius Ptolemaeus), flourished second century. Ancient astronomer and geographer; born in Egypt; was the author of the system of astronomy called after him; left behind him two chief writings bearing, one on astronomy and one on geography.

Pufendorf, Samuel, Baron von, 1682-1694. Eminent German jurist; born at Chemnitz, Saxony; wrote several works on jurisprudence, one of which, under the ban of Austria, was burned there by the hangman, but his "De Jure Naturæ et Gentium" is the one on which his fame rests.

Pulaski, Casimir, Count, 1748-1779. A Polish patriot. He won distinction in the revolution against Russia and afterward came to America, 1777, when he was appointed brigadier-general; killed at the siege of Savannah.

Purcell, Henry, 1659-1695. Eminent English musician; born at Westminster; excelled in several forms of musical composition; was the author of anthems, cantatas, glees, etc., which attained great popularity.

Pusey, Edward Bouverie, 1800-1882. An English theological writer; a leader of the Anglo-Catholic party in the Established Church; born in Berkshire. He published "The Holy Eucharist a Comfort to the Penitent," a sermon which resulted in his suspension for three years; two sermons on "The Entire Absolution of the Penitent," equally revolutionary. Of his larger works the most important are "The Doctrine of the Real Presence," and "The Real Presence of the Body and Blood of Christ the Doctrine of the English Church."

Putnam, Israel, 1718-1790. American Revolutionary general; conspicuous at the battle of Bunker Hill.

Pyle, Howard, 1853- . . . An American illustrator and author; born in Wilmington, Del.; an illustrator for periodicals, and has become popular also as a writer, chiefly of juvenile literature. His works include "Buccaneers and Marooners of America," etc.

Pym, John, 1584-1643. English republican statesman and orator.

Pyrrho, 365-275 B. C. Greek skeptic and philosopher. **Pyrrhus, 317-272 B. C.** King of Epirus and one of the greatest of ancient generals; defeated the Romans and conquered Macedonia.

Pythagoras, 600?-510? B. C. First Greek philosopher; taught the doctrine of transmigration of souls; basis of his philosophy, number and harmony; soul distinct from body.

Quatrefages (kahtr-fahz'), de Breau, 1810-1892. French naturalist and anthropologist; was professor at the Natural History Museum in Paris; devoted himself chiefly to anthropology.

Quatremere (kahtr-mair'), Etienne Marc, 1782-1857. French Orientalist; born in Paris; was professor at the College of France; was distinguished for his knowledge of Arabic and Persian, as well as for his works on Egypt.

Quay, Matthew Stanley, 1833-1904. An American legislator; born in Dillsburg, Pa.; entered the Union army in 1861 and won distinction; was promoted colonel and assistant commissary general; received a congressional medal of honor for exceptional service; elected United States senator in 1887, and again in 1901.

Quesnay (kay-nay'), Francois, 1694-1774. A French physician and economist; born near Paris, France; he was the founder of the school of economists called Physiocrats, and very influential on Adam Smith and all modern political economy.

Quincy, Josiah, 1744-1775. An American lawyer; orator and essayist; born in Massachusetts. His son Josiah, 1772-1864, was also distinguished as an orator; while a member of Congress he opposed the admission of Louisiana, also the war of 1812 with Great Britain.

Quintan, John Anthony, 1790-1858. An American military officer; born in Rhinebeck, New York; in 1846, he was appointed brigadier-general of United States volunteers in the war with Mexico, distinguishing himself at Vera Cruz and Monterey, after which latter engagement he was brevetted major-general, and was voted a sword by Congress for gallantry; he participated in the attack on Chapultepec, and was foremost in the assault on the city of Mexico, which city he governed till order was established.

Rachel, Eliza, 1821-1858. A great French tragedienne; born in Switzerland, of Jewish parents; made her debut in Paris in 1837, and soon became famous as the interpreter of the principal characters in the masterpieces of Racine and Corneille, her crowning triumph being the representation, in 1843, of Phedre in the tragedy of Racine.

Radcliffe, John, 1650-1714. Physician; born at Wakefield; studied at Oxford; commenced practice in London, 1684; by his art and professional skill rose to eminence; left £40,000 to found a public library in the University of Oxford.

Radezsky, Johann, Count von, 1766-1858. Austrian field marshal; born in Bohemia; entered the Austrian army in 1784; distinguished himself in the war with Turkey in 1788-1789 and in all the wars of Austria with France; checked the revolution in Lombardy in 1848; defeated and almost annihilated the Piedmontese army under Charles Albert in 1849, and compelled Venice to capitulate in the same year, after which he was appointed governor of Lombardy.

Rae, John, 1818-1893. Arctic voyager; born in Orkneys; studied medicine in Edinburgh; first visited the Arctic regions as a surgeon; was engaged in seven expeditions to these regions, of which he published reports.

Raeburn, Sir Henry, 1756-1823. Portrait painter; born at Stockbridge, near Edinburgh; was introduced to Reynolds in London, and after two years' absence in Italy settled in Edinburgh, and became famous as one of the greatest painters of the day; the portraits he painted included likenesses of all the distinguished Scotchmen of the period, at the head of them Sir Walter Scott.

Raleigh, Sir Walter, 1552-1618. English courtier, statesman, navigator, and author; a favorite of Queen Elizabeth; executed by James I.

Rameau (ra-mo'), Jean Philippe, 1683-1764. French

composer; born at Dijon; wrote on harmony, and settling in Paris, composed operas, his first successful one "Hippolyte et Aricie," and his best "Castor et Pollux."

Ramesses. The name of several ancient kings of Egypt, of which the most famous are **Ramesses II.**, who erected a number of monuments in token of his greatness, and **Ramesses III.**, the first king of the twentieth dynasty under whose successors the power of Egypt fell into decay.

Ramus, Peter, or Pierre de la Ramee, 1515-1572. A French philosopher and humanist; son of poor parents; became a servant in the College of Navarre; devoted his leisure to study, and became a great scholar; was interdicted from teaching philosophy, but the judgment was reversed by Henry II., and he was made a royal professor; was massacred on the eve of St. Bartholomew.

Randolph, John, 1773-1833. A noted eccentric American politician; born at Cawsons, Va.; entered Congress in 1799, and held a commanding position there as leader of the Democratic party; was a witty, sarcastic speaker; sat in the Senate from 1825 to 1827, and in 1830 was minister to Russia; liberated and provided for his slaves.

Ranke (rank'), Leopold von, 1796-1886. A German historian; born in Wiehe; with Niebuhr, the founder of the modern historical school. The work, "A History of the Roman and German People from 1494 to 1535," procured him a call to Berlin as Professor of History, in 1825. Among his earlier works are "The Princes and Peoples of Southern Europe in the 16th and 17th Centuries," and "The Roman Popes in the 16th and 17th Centuries," one of his great masterpieces of historical writing. He began his "Universal History" when he was an old man of eighty-two.

Raphael, Raffaello Sanzio, or Santi d' Urbino, 1483-1520. The greatest of modern painters; born in Urbino, Italy. He received his earliest instructions from his father, Giovanni Santi, after whose death, in 1494, he probably became the pupil of Timoteo Viti. In 1504 he visited Florence, and lived there till 1508, when he was called to Rome by Pope Julius II., and employed to paint the chambers of the Vatican. Raphael spent the rest of his short life at Rome. In the numerous works, frescoes, and oil paintings of this unrivaled master, three styles are distinctly recognizable. The first is the "Umbrian," the second "Florentine," and the third style "Roman," and is peculiarly Raphael's own—that which constitutes him the greatest of painters. His supreme excellence is the equable development of all the essential qualities of art, composition, expression, design, coloring. Among Raphael's oil paintings are the "St. Cecilia," at Bologna; the famous "Madonna di San Sisto," now in the Dresden gallery; the "Spasimo di Sicilia," now at Madrid; and the "Transfiguration," his last work. His drawings are very numerous, and are to be found in most of the public and private museums of America and Europe. Raphael, who had occupied himself with architecture as well as painting, was charged, on the death of his friend Bramante, in 1514, with the direction of the building of St. Peter's. Raphael died in Rome from the effects of a fever, after an illness of a fortnight, on his thirty-seventh birthday.

Rauch, Christian, 1777-1857. Eminent Prussian sculptor; born in Waldeck; patronized by royalty; influenced at Rome by Thorwaldsen and Canova; resided chiefly in Berlin; executed statues of Bücher, Dürer, Schiller, and others, as well as busts; his masterpiece is a colossal monument in Berlin of Frederick the Great.

Rawlins, John Aaron, 1831-1869. An American military officer; born in E. Galena, Ill.; assistant adjutant-general of General Grant in September, 1861; served in the campaigns of 1862 and 1863; in November, 1862, was appointed chief of General Grant's staff. In 1863 he received the rank of brigadier-general in the United States Army. He became secretary of war in March, 1869. He died in Washington, D. C.

Ray, or Wray, John, 1627-1706. An English naturalist; born in Black Notley, Essex, England. Ray's zoological works are considered by Cuvier as the foundation of modern zoology. He died in Black Notley.

Raymond, Henry Jarvis, 1820-1869. An American journalist; born in Lima, N. Y.; was graduated at the University of Vermont in 1840; in 1841 he became assistant editor of the New York Tribune. In 1864, was chosen as representative from New York to the thirty-ninth Congress. He died in New York.

Read, Nathan, 1759-1849. An American inventor; claimed to have been the first to use steam engines for propelling boats and carriages; born in Worcester

county, Mass. He converted the condensing engine of Watt into a complete working, portable, high-pressure engine, twelve years before the high-pressure engine was known. In 1790 he petitioned Congress for a patent for land carriages to be driven by steam. It created so much amusement that he withdrew it. He built in 1799, a small steamboat, substantially identical with Fulton's of 1807. It is alleged that his combinations amounted to the inland steamers now in use. Died in Belfast, Me.

Reaumur (*ray-ou-mur*), Rene, 1683-1757. French scientist; born in La Rochelle; is best known as the inventor of the thermometer that bears his name.

Recamier (*ray-kah-may*), Jeanne Françoise Julie Adelaide Bernard, 1777-1849. French lady noted for her beauty and accomplishments.

Reclus (*ray-klu*), Elisée, 1830- A celebrated French geographer; from his extreme democratic opinions left France in 1851, lived much in exile, and spent much time in travel; wrote "Geographie Universelle," his greatest work.

Red Jacket, 1760-1880. Seneca Indian chief.

Reed, Thomas Brackett, 1839-1902. An American statesman; born in Portland, Me.; member of the Maine Legislature, 1866-1869, and of the Senate, 1870; state attorney-general, 1870-1872; member of Congress, 1877-1899; and speaker of fifty-first, fifty-fourth, and fifty-fifth Congresses. In 1896 Mr Reed was a prominent candidate for the Republican presidential nomination. He resigned from Congress in 1899, and resumed the practice of law in New York city. He died of uræmia at Washington, D. C.

Regnault (*resh-no*), Henri, 1843-1871. French painter; born in Paris; son of following; a genius of great power and promise, of which several remarkable works by him are proof; volunteered in the Franco-German War, and fell at Buzenval.

Regnault, Henri Victor, 1810-1878. A noted French physicist; born at Aix-la-Chapelle; important discoveries in organic chemistry won him election to the Academy of Sciences in 1840; lectured in the College de France and the Ecole Polytechnique; became director of the imperial porcelain manufactory of Sevres; did notable work in physics and chemistry, and was awarded medals by the Royal Society of London.

Regulus, flourished third century, B.C. A Roman of the Romans, was twice consul, in 267 and 256 B.C.; defeated the Carthaginians, both by sea and land, but was at last taken prisoner and subjected to excruciating tortures.

Reich'enbach, Karl, Baron von, 1788-1869. Expert in the industrial arts, particularly in chemical manufacture; he was a zealous student of animal magnetism, but is best known from his theories concerning od.

Reinhart, Charles Stanley, 1844-1866. An American artist; born in Pittsburgh, Pa.; he exhibited in Paris, Munich, and New York city, and was a member of numerous art association; he died in New York.

Rembrandt van Ryn, Paul, 1606-1669. Dutch painter; chief of the Dutch school; the greatest master of colors, and unrivaled as an etcher.

Reményi (*ray-meny-eh*), Edouard, 1830-1898. An Hungarian violinist; born in Heves, Hungary; in 1854 he visited London, where he was appointed solo violinist to Queen Victoria; in 1860 returned to Hungary, where he attained great distinction; in 1878 he came to the United States, where he spent much of his time and gave many concerts; died in San Francisco, Cal.

Remington, Frederick, 1801- An American artist and author; born in Canton, N. Y.; he is one of the most conspicuous of American artists in "black and white."

Remsen, Ira, 1846- An American chemist; born in New York city; was professor of Chemistry at Williams College, 1872-1878; founded the *American Chemical Journal* in 1879. He is a member of many scientific organizations and societies, and the author of numerous text-books, including "The Principles of Theoretical Chemistry," "Inorganic Chemistry," "Chemical Experiments," etc.; became professor of Chemistry at Johns Hopkins University in 1876, and succeeded Dr. Daniel Collin Gilman as president there in 1901.

Remusat (*ray-moo-sah*), Charles, Comte de, 1797-1875. French politician and man of letters; born in Paris; drew up a protest against the ordinances of Polignac, which precipitated the Revolution of July; was minister of the Interior under Thiers; was exiled after the *coup d'état*; gave himself mainly to philosophical studies on his return.

Reszke, Edouard de, 1855- . . . A Polish opera singer; born in Warsaw, Poland; a brother of Jean de

Reszke. He made his first appearance in Paris, in 1876, taking rank as a leading star, with a bass voice of remarkable range and power. He has made several visits to the United States, filling the chief roles in grand opera.

Reszke, Jean de, 1853- . . . A Polish opera singer; born in Warsaw, Poland. His debut was made in Venice in 1874, under the name of De Reschl, as a baritone. In 1879 he sang as a tenor in Madrid; and since that year he has sung only in tenor roles. His voice is of remarkable scope. He has made several tours in America.

Reuter (*roi-ter*), Paul Julius, Baron, 1821-1899. A German-English news agent, at one time well known from the familiar newspaper heading, *Reuter's Telegram*; born in Cassel. In 1851 he transferred his headquarters to London. As telegraphs extended throughout the world he multiplied the ramifications of his system till it embraced the remotest regions. He even maintained couriers where the telegraphs did not reach—e. g., between Peking and Kiachta.

Revere, Paul, 1785-1818. American engraver and Revolutionary patriot; carried the news of Gage's impending attack to Concord.

Reynolds, John Fulton, 1820-1863. An American military officer; born in Lancaster, Pa.; served in the Mexican War; was appointed commandant at West Point in 1859; served in the Civil War in active service; in 1863 was promoted major-general of volunteers. His corps was the vanguard at Gettysburg, where he was killed.

Reynolds, Sir Joshua, 1723-1792. The chief of English portrait painters; born in Devonshire; visited Italy and the great centers of art there, when he lost his hearing, and settled in London in 1752, where he began to paint portraits, and had as the subjects of his art the most distinguished people, "filled England with the ghosts of her noble squires and dames."

Rhodes, Cecil John, 1853-1902. A South African statesman; born in Hertfordshire, England. Was sent for his health to Natal, where his brother was a planter. He subsequently went to the Kimberley diamond diggings; there he soon became conspicuous and amassed a fortune. He went back to England, and entered at Oriel College, Oxford, and, though his residence was cut short by ill-health, he ultimately took his degree. He entered the Cape House of Assembly as member for Barkly. In 1890 he became prime minister of Cape Colony. He died in Cape Town, South Africa. In his will Mr. Rhodes left about \$10,000,000 to found a number of three-year scholarships tenable at Oxford, England. The income for each scholarship was \$1,500 a year, and two were offered to each state and territory in the American Union.

Ribera, Jusepe, 1588-1656. A Spanish painter; born near Valencia; indulged in a realism of a gruesome type; had Salvator Rosa and Giordano for pupils.

Ricardo, David, 1772-1823. English political economist; born in London, of Jewish parentage; realized a large fortune as a member of the Stock Exchange.

Richard I. (Cœur de Lion), 1157-1199. King of England; led a large army into Palestine; conquered Acre and defeated Saladin. **Richard II.**, 1366-1400. **Richard III.**, 1452-1485. Last of the Plantagenets.

Richelieu (*resh-le-oo*), Armand Jean Duplessis, Cardinal de, 1585-1642. Born in Paris, of a noble family; was minister of Louis XIII., and one of the greatest statesmen France ever had; from his installation as prime minister in 1624 he set himself to the achievement of a threefold purpose, and rested not till he accomplished it—the ruin of the Protestants as a political party, the curtailment of the power of the nobles, and the humiliation of the House of Austria. In the councils of Europe; his administration was signalized by reforms in finance, in the army, and in legislation; he was a patron of letters, and the founder of the French Academy.

Rienzi (*ren-ee-ze*), Cola di, 1313-1354. Roman tribune; born at Rome, of humble origin; incited his fellow citizens to rise against the tyranny to which they were subjected at the hands of the nobles; but his own rule became intolerable, and he was assassinated just seven years after the commencement of his political career.

Risto'ri, Adelaide, 1822- . . . Distinguished Italian tragedienne; her career on the stage was a continuous triumph; the roles in which she specially shone were those of Lady Macbeth, Medea, and Mary Stuart.

Rit'tenhouse, David, 1732-1796. An American astronomer; born near Philadelphia, Pa.; originally a clock and mathematical instrument maker; he became master of the United States mint, and succeeded Franklin as president of the American Philosophical Society;

he was the first to use spider lines in the focus of a transit instrument; he died in Philadelphia, Pa.

Robert II., 1816-1890. King of Scotland from 1871-1890; son of Walter Stewart and Marjory, only daughter of Robert Bruce; succeeded David II., and became the founder of the Stuart dynasty.

Robertson, Frederick William, 1816-1853. Distinguished preacher; born in London; entered the Church in 1840; was curate first at Winchester, next at Cheltenham, and finally settled in Brighton; is known far and wide by his printed sermons, for his insight into, and his earnestness in behalf of, Christian truth.

Robespierre (*ro-bais-pe-ayr*'), **Maximilien Marie Isidore**, 1758-1794. A notorious French revolutionist; died on the guillotine, to which he had assigned thousands of innocent men and women as president of the "Committee of Public Safety," in association with Couthon and Saint-Just.

Robin Hood. The hero of a group of old English ballads; represented as an outlaw and a robber, but of a gallant and generous nature, whose familiar haunts are the forests of Sherwood and Barnsdale, where he fleets the time carelessly in the merry greenwood. He is ever genial and good-natured, religious, respectful to the Virgin and to all women for her sake, with a kind of gracious and noble dignity in his bearing. There is no evidence worth anything that Robin Hood was ever more than a mere creation of the popular imagination.

Rochambeau (*ro-shon-be'*), **Jean Baptiste Donatien de Vimeur de**, Count, 1725-1807. French marshal; general in America in 1781.

Rockefeller, John Davidson, 1839- . . . An American capitalist; born in Richford, Toga county, N. Y. He engaged in business when he was nineteen and soon showed ability in detail and discretion in management. When discoveries of petroleum roused speculative interest in 1860, he owned a refinery in Cleveland, Ohio. He was quick to perceive that his opportunities were at hand. His business developed and enlarged with amazing rapidity. In 1870 he became president of the Standard Oil Company, a monopolistic corporation, and through which he accumulated immense wealth. He has made large donations to educational institutions, notably to the University of Chicago, to which he has given several millions of dollars. He has also made large contributions to religious and charitable purposes. He is believed to be the richest man in America.

Rodgers, John, 1771-1838. An American commodore; born in Maryland. He won distinction in operations against France, Tripoli, and England. **Rodgers, John**, 1812-1882. Son of the preceding, also a naval officer; born in Maryland; served with credit during the Civil War, and was appointed rear-admiral, 1870.

Roebing, John Augustus, 1806-1869. An American engineer; born in Muhlbach, Prussia; came to the United States in 1831, and settled in Pittsburgh, Pa. His greatest work was the bridge over the East river, connecting New York and Brooklyn. He died while the construction was in progress, in Brooklyn, and the bridge was completed by his son.

Roland, Manon Jeanne Philippin, Madame, 1754-1798. Wife of Jean Marie, and herself the spirit of the Girondin party; born in Paris; she became the wife of Roland in 1779, and as her love for him was founded on his antique virtues and his philosophic spirit, she has been called "The Heloise of the eighteenth century." She became the sharer in all his studies, aided him in editing his works, and during his two ministries acted as his secretary and entered into all the intrigues of his party without debasing herself by their meanness. After the flight of her husband, Madame Roland was arrested by order of the Paris Commune under the dictation of Marat and Robespierre, and consigned to the Abbaye prison, from which, on October 31, she was removed to a more wretched abode in the Conciergerie, until her execution.

Rollo, 860-932. A Norwegian, who became the chief of a band of Norse pirates who one day sailed up the Seine to Rouen and took it, and so ravaged the country that Charles the Simple was glad to come to terms with them by surrendering to them part of Neustria, which thereafter bore from them the name of Normandy; after this Rollo embraced Christianity, was baptized by the Bishop of Rouen, and was the first Duke of Normandy.

Romanoff, Romanov, or Romanow. The surname of the dynasty of Russia founded by Michael Feodorovich, -1645, son of the Metropolitan of Rostov; elected Czar 1613; the direct line became extinct, 1722, the empress Elizabeth being succeeded by her nephew, Peter III., founder of the Romanoff-Oldenburg or Romanoff-Holstein-Gottorp dynasty.

Romulus. The traditional founder of Rome, twin brother of Remus, sons of Rhea Sylvia, by the god Mars; mother and children being cast into the Tiber, the boys were rescued and nurtured by a she wolf; Remus was killed in a dispute over the building of the wall; the city was peopled by outlaws, who obtained wives by the "Rape of the Sabines"; Romulus was a bold and successful warrior, and was translated to heaven and made a god under the name of Quirinus.

Rosa, Salvatore, 1615-1673. Italian painter; born near Naples; a man of versatile ability; his paintings of landscape were of a somber character, and generally representative of wild and savage scenes; he lived chiefly in Rome. He is said to have taken part in the insurrection of Masaniello at Naples in 1647, but that is unlikely.

Roosevelt, Theodore, 1858- . . . An American statesman, and twenty-sixth president of the United States; born in New York city; was graduated at Harvard University in 1880 and began the study of law; the next year he was elected to the Assembly from the twenty-first district of New York, serving in the Legislatures of 1883, 1884, and 1885; Republican candidate for mayor against Abram S. Hewitt, United Democracy, and Henry George, United Labor, in 1886; Mr. Hewitt was elected by about 22,000 plurality. Appointed a Republican member of the United States Civil Service Commission by President Cleveland in his first administration; called by President McKinley, April 6, 1897, to be assistant secretary of the navy; when war was declared against Spain Mr. Roosevelt refused to remain in the quiet government office; for years he had spent his summers on a Dakota ranch, and learned to know cowboys as strong, sincere men, on whom the nation could rely; from these the famous cavalry troop known as the "Rough Riders" was largely recruited; for bravery in the battle of Las Guasimas Roosevelt was promoted colonel and in the three days of fighting before Santiago, and especially in the magnificent charge up San Juan hill, he acted with conspicuous gallantry; on the return of the Rough Riders from Cuba, Roosevelt was the popular idol of the country, and despite considerable opposition from professional politicians was nominated for governor of New York on the Republican ticket, Sept. 27, 1898; he was elected by a plurality of 18,000. Nov. 4; in the Republican National Convention held in Philadelphia in the summer of 1900 Roosevelt was enthusiastically nominated for vice-president on the Republican ticket headed by William McKinley; he was elected Nov. 4, and was formally installed March 4, 1901; on the death of President McKinley in Buffalo, N. Y., Sept. 14, 1901, Roosevelt took the oath of office as his successor, and became the twenty-sixth president of the United States; he wrote "Winning of the West," "Life of Gouverneur Morris," "Life of Thomas Hart Benton," "Naval War of 1812," "History of New York," "American Ideals and Other Essays," "The Wilderness Hunter," "Hunting Trips of a Ranchman," "Ranch Life and the Hunting Trail," "The Rough Riders," "Life of Cromwell," "The Strenuous Life," etc.

Rosa, Sir John, 1777-1866. Arctic explorer; born in Wigtownshire; made three voyages, the first in 1818, the second in 1829, both in search of the Northwest passage, the third in 1850, in an unsuccessful search for Franklin. After his return he published accounts of his first two voyages, in both of which he made important discoveries.

Rossini, Gioacchino, 1792-1868. Celebrated Italian composer of operatic music; born at Pesaro; his operas were numerous, of a high order, and received with unbounded applause, beginning with "Tancredi," followed by "Barber of Seville," "La Gazza Ladra," "Semiramide," "William Tell," etc.; he composed a "Stabat Mater," and a "Mass" which was given at his grave.

Rothschild, Mayer Anselm, 1743-1812. Jewish banker at Frankfurt, Germany; founder of the house of Rothschild.

Rubens, Peter Paul, 1577-1640. The greatest of the Flemish painters; born at Siegen, in Westphalia; went with his widowed mother in 1587 to Antwerp, where he sedulously cultivated the painter's art, and early revealed his masterly gift of coloring; went to Italy, and for a number of years was in the service of the Duke of Mantua, who encouraged him in his art, and employed him on a diplomatic mission to Philip II. of Spain; executed at Madrid some of his finest portraits; returned to Antwerp in 1609; completed in 1612 his masterpiece, "The Descent from the Cross," in Antwerp Cathedral; with the aid of assistants he painted the series of twenty-four pictures, now in the Louvre, illustrating the principal events in the life of Maria de' Medici during 1622-1629; diplomatic missions engaged him in Spain and, at the

English courts, where his superabundant energy enabled him to execute many paintings for Charles I.

Rubinstein, Anton Gregor, 1830-1894. A Russian musician; born at Wechwotynecz, Kherzon; in 1848 settled in St. Petersburg as teacher of music, where he succeeded in getting a musical conservatory founded, and became its director. In 1872 he came to the United States and had an enthusiastic reception. He ended his concert tours in 1886. As a pianist he held the highest rank, being usually reckoned the greatest since Liszt. He ceased playing in public some time before his death, which occurred in St. Petersburg, Russia.

Rudolf I., 1218-1291. Of the House of Hapsburg; founder of the Austrian dynasty; greatly increased his father's domain by marriage, inheritance, and conquest, becoming the most powerful prince in southern Germany; acquired a remarkable ascendancy among the German princes, and was elevated to the imperial throne in 1273, and by friendly concessions to the pope, Gregory X., terminated the long struggle between the church and the empire; shattered the opposition of Ottocar, king of Bohemia, and brought peace and order to Germany.

Rumford, Benjamin Thompson, Count, 1753-1814. An American scientist; born in Woburn, Mass. Being a Tory in sympathy, he lived in London during the American Revolution. After serving England for a time, he entered the service of the Elector of Bavaria; rose to the position of minister of war, and was finally created a Count of the Holy Roman Empire. He spent the last years of his life at Auteuil, busily engaged in scientific researches. Died in Auteuil, near Paris.

Rupert of Bavaria, Prince, 1619-1682. An English military officer; born in Prague, Bohemia; was made admiral of the English royal fleet. After the Restoration he was appointed lord-high-admiral and served with Monk against the Dutch. As one of the founders and the first governor of the Hudson Bay Company, his name was given to Rupertsland. He died in London, and was buried in Westminster Abbey.

Rush, Benjamin, 1745-1813. An American physician; born in Philadelphia; in 1769 was made Professor of Chemistry in the Philadelphia Medical College. Elected a member of the Continental Congress, he signed the Declaration of Independence. In April, 1777, he was appointed surgeon-general, and in July physician-general of the Continental army. He was a founder of the Philadelphia dispensary, the first in the United States. In 1799 Rush was appointed treasurer of the United States mint, which post he held till his death. He was called "the Sydenham of America," and his medical works brought him honors from several European sovereigns. He died in Philadelphia.

Ruydael (rois'dayhl), Jacob, 1625-1682. A famous Dutch landscape painter; born and died at Haarlem; few particulars of his life are known; his best pictures, to be seen in the galleries of Dresden, Berlin, Paris, etc., display a fine poetic spirit.

Ruyter (roo'iter), Michael de, 1607-1676. A famous Dutch admiral; born of poor parents at Flushing; was ennobled in 1660 by the king of Denmark for services rendered in the Dano-Swedish war; for two years fought against Turkish pirates in the Mediterranean; commanded the Dutch fleet in the second war against England, and in 1667 struck terror into London by appearing and burning the shipping in the Thames; held his own against England and France in the war of 1672; co-operated with Spain against France; was routed and mortally wounded off the coast of Sicily; a man of sterling worth.

Sagasta, Praxedes Mateo, 1827-1908. A Spanish statesman; born in Torrecilla. He had a place in Prim's cabinet; supported Amadeus; held office under Serrano; and under the new monarchy became leader of the Liberals, being premier 1897-1899, thus conducting public affairs during the trying period of the Spanish-American War.

Saint Arnaud (ar-no'), Jacques Leroy de, 1796-1854. A noted French marshal; born in Paris; entered actively into the plans of Louis Napoleon to overthrow the Republic; commanded the French forces at the outbreak of the Crimean War, and took part in the battle of the Alma, but died a few days later.

St. Clair, Arthur, 1734-1818. An American military officer; born in Thurso, Scotland. He was at Louisburg in 1758 and Quebec in 1759; engaged in the battles of Trenton and Princeton; was in command in 1777 at Ti-conderoga; was at the battle of Yorktown; president of Congress in 1787; governor of Northwest Territory in 1789-1802. The expeditionary force against the Miami

Indians, numbering 1,400, commanded by him, was cut to pieces near Miami village in 1791. He resigned his command in 1792, and died near Greensburg, Pa.

Saint Gau'dens, Augustus, 1848- . . . An American sculptor; born in Dublin, Ireland; came to the United States in infancy. In 1871, while in Rome, he produced his first figure, "Hiawatha." He returned to the United States in 1873. He designed the Medal of Award of the Columbian Exposition, and a number of presentation medals authorized by Congress.

Saint-Just, Antoine Louis Leon Florelle de, 1767-1794. A French revolutionist; became the right hand of Robespierre, and was one of the most energetic and resolute members of the Mountain party. He fell with Robespierre, and perished on the same scaffold with him.

Saint Saens (san son'), Charles Camille, 1835- . . . A French musician; born in Paris; for nineteen years organist of the Madeleine; composer of a number of operas indifferently successful, and of much orchestral and chamber music of a masterly kind; is held to be one of the greatest pianists and organists.

Saint-Simon (san se-mo-n'), Claude Henri, Comte de, 1760-1825. A versatile French socialist, philosopher, and author. He served in the American army in the Revolution; returning to France he spent a fortune in extravagant living; he was also the founder of the philosophical sect of which Thierry, Comte, and Chevalier were the principal apostles.

Saladin (sal'ah-deen), (Malek Nasir Yousseuf), 1137-1193. An eminent Saracen sultan; became sovereign of Egypt, 1174. He captured Jerusalem but was defeated and besieged in Acre, by Richard Cœur de Lion and Philip Augustus of France, 1189, surrendering under a three years' truce, 1191, retaining Jerusalem. He was of a chivalric and noble character.

Salisbury (awls'bury), Robert Arthur Talbot Gascoyne Cecil, third Marquis of, 1830-1903. An English statesman; born in Hatfield, Hertfordshire, England. As Lord Cecil he entered Parliament in 1853; in 1866 he was appointed secretary of state for India. In 1866 he became Lord Cranborne and heir to the marquise. He retired from the ministry, but on the death of his father in 1868 and his elevation to the House of Lords he returned to his old party associations. He resumed the secretaryship for India in 1874. In 1878 he accompanied Disraeli to the congress at Berlin, and on the death of that statesman became the recognized leader of the Conservative party. He became premier on the fall of the Gladstone government in 1885. Gladstone succeeded again to the power in the end of the same year, but in the June following Salisbury again became the premier and foreign secretary. In 1892 the majority in Parliament being in favor of a Home Rule bill for Ireland, Salisbury retired from office. In 1895 he was recalled.

Sal'omon, Johann Peter, 1745-1815. A German violinist and composer; born at Bonn; went to London, and is remembered for the great stimulus he gave to musical culture; composed songs, glees, violin pieces, etc.; buried in Westminster Abbey.

Salvini (sal-ree'nee), Tommaso, 1829- . . . An Italian tragedian; born in Milan. In 1849 he fought with distinction in the revolutionary war. He scored success in Brussels and Madrid; visited the United States in 1873 and England 1875. After another visit to the United States in 1880, and to Great Britain in 1884, he retired from the stage to enjoy a life of leisure in his villa near Florence, 1890.

Sankey, Ira David, 1840- . . . An American evangelist; born in Edinburg, Pa. Was associated with the evangelist, the late Dwight L. Moody, for some years, attracting and holding the attention of great audiences by singing hymns composed by himself.

Santa Ana, or Santa Anna, Antonio Lopez de, 1795-1876. A Mexican president; born in Jalapa, Mexico. He took a prominent part in the expulsion of the Spaniards from Mexico, and proclaimed the Mexican Republic in 1822. He was president in 1846 and commanded in the war with the United States, 1846-1848. After General Scott's occupation of the city of Mexico, in September, 1847, he resigned and left the country, but was president in 1853-1855. He died in the city of Mexico.

Santos-Dumont, 1874- . . . A French aeronaut; born in Brazil, South America. In 1900 he made several partly successful attempts to fly with his dirigible balloon; but it was not till 1901 that he succeeded in perfectly controlling his machine in the face of a strong wind. In September, 1901, he won the Deutsch prize of \$20,000 for the navigation of a flying machine under cer-

tain conditions. In January, 1902, he made several successful flights near Monte Carlo.

Sardanapalus. Flourished 668 B. C. The last king of Assyria; led a luxurious, effeminate life, but, surprised when at his ease by a large army of invaders, he suddenly developed into a hero, till hard pressed at length and shut up in Nineveh, and after two years' defense finding resistance hopeless, he reared a funeral pile, and, setting fire to it, threw himself upon it, and perished in the flames.

Sartain, John, 1808-1897. An American artist; born in London, England; came to the United States in 1830, and was one of the first to introduce mezzotint engraving. He was the author of a large number of engravings for book illustration, and engraved many historical paintings; designed the monument to Washington and Lafayette in Monument Cemetery, Philadelphia, and published interesting personal reminiscences. He died in Philadelphia, Pa.

Saul. Flourished eleventh century B. C. A Benjamite, the son of Kish, who fell in with Samuel, as he was on the way in search of his father's asses that had gone astray, and from his stature and stately bearing was anointed by him to be first king of Israel; he distinguished himself in the field against the enemies of his people, but fell at the hands of the Philistines after a reign of forty years, and after several insane attempts on the life of David, who had been elected to succeed him.

Savonarola, Girolamo, 1452-1497. A distinguished Italian orator and religious reformer; martyred.

Saxe, Hermann, Maurice, Count de, 1690-1750. A distinguished marshal of France; son of Augustus (The Strong), Elector of Saxony and King of Poland; he gained the great victories of Fontenoy and Laufeld, in Flanders.

Say, Leon, 1826-1896. A French statesman and economist; born in Paris; became minister of finance in the government of M. Thiers; was appointed ambassador to London in 1880, and soon afterward was elected president of the Senate. Among his works are: "Finances of France," "State Socialism," "Democratic Solution of the Tariff Question," and "Turgot." He edited "The Dictionary of Finance" and "The New Dictionary of Political Economy."

Sean derbeg (Prince or Bey Alexander), 1403-1468. The patriot chief of Albania, and the great hero of Albanian independence, who in the fifteenth century renounced Islamism for Christianity, and by his military prowess and skill freed Albania from the Turkish yoke; throughout his lifetime maintained its independence, crushing again and again the Turkish armies; was known among the Christians as George Castriot.

Schaff, Philip, 1819-1898. A theologian; born in Switzerland; studied in Germany; came, recommended by high names, to the United States, and became a professor, first in Pennsylvania, and finally in New York.

Scheele, Carl, Wilhelm, 1742-1786. Swedish chemist; born in Stralsund; was an apothecary at Upsala and Koeeping; during his residence at the latter made numerous important discoveries, and published many chemical papers, his chief work, "Experiments on Air and Fire."

Schiffer, Ary, 1795-1858. An eminent French painter. His works belong to the sentimental class, and are considered by some critics as wanting in color and power.

Schelling, Friedrich Wilhelm Joseph von, 1775-1854. One of the most eminent of German metaphysical philosophers, classed with Kant, Hegel, and Fichte.

Schleiermacher (shl'er-mah-ker), Friedrich Ernest Daniel, 1768-1834. Great German theologian; born at Breslau; brought up among the Moravians, his mind revolted against the narrow orthodoxy of their creed, though the religious feeling he inherited never left him. He elaborated one of the most influential systems of religious philosophy.

Schoolcraft, Henry Rowe, 1793-1864. An American author, noted as an Indian authority; born in Albany county, New York; thirty years of his life he spent among the Indians, and through him many laws were enacted for their protection; among his numerous publications are: "Travels in the Central Portions of the Mississippi Valley," "The Indian and his Wigwam," etc.; he died in Washington, D. C.

Schopenhauer, Arthur, 1788-1860. A German philosopher; born in Dantzic; the principal work of Schopenhauer is entitled "The World as Will and Idea"; he published several other works of philosophy, of which the most important is, "The Two Fundamental Problems of Ethics"; he died in Frankfurt-on-the-Main.

Schubert, Franz Peter, 1797-1828. An Austrian

composer, born in Vienna, Austria. The number and variety of his compositions is extraordinary; the most admired are his songs, and among them "The Erl King" and "Ave Maria" are perhaps the best known; but he wrote also operas, sonatas, symphonies, overtures, cantatas, six masses, etc. Schubert spent almost his whole life at Vienna.

Schumann, Robert, 1810-1856. A German musical composer; born in Zwickau, Saxony. In the year following his marriage he published nearly 140 songs, many on Heine's words; he then commenced his great series of orchestral works, his symphony in B flat being first performed at the close of 1841; under stress of work, however, his reason failed him, and after an attempt to drown himself in 1854 he was confined in a lunatic asylum, where he died.

Schurz, Carl, 1823- . . . An American statesman; born in Liblar, near Cologne, Prussia. About 1852 he came to the United States, and settled in Madison, Wis. In 1861 he was appointed minister to Spain, but when the Civil War broke out resigned that he might return and join the Union army. In 1869 was elected United States senator from Missouri. He was secretary of the interior under President Hayes from 1877 to 1881. He afterward wrote several books, among them a "Life of Henry Clay."

Schuyler (sky'ler), Philip, 1783-1804. An American military officer; born in Albany, N. Y. He was Federalist United States senator from New York, 1789-1791, and was again elected a senator, in place of Aaron Burr, in 1797. He died in Albany.

Schwartz, Berthold, 1800-1869. A German monk; is said to have discovered gunpowder.

Schwarz'enberg, Karl Philipp, Prince von, 1771-1820. An Austrian general. He negotiated the marriage of Napoleon I. and the Austrian princess, and commanded the allies at the victory of Leipsic.

Schwat'ka, Frederick, 1849-1892. An American Arctic explorer; born in Galena, Ill. In 1886 he commanded the New York Times Alaskan expedition, and did much to encourage the settlement of that territory; published "Along Alaska's Great River," "The Children of the Cold," etc. He died in Portland, Ore.

Schweinitz, Lewis Davis von, 1780-1834. An American botanist; born in Bethlehem, Pa. His original researches resulted in an addition of over 1,400 new species to the catalogue of American flora. He bequeathed his large and valuable collection of plants to the Academy of Natural Science of Philadelphia.

Scipio (sip'e-o) Africanus Major, Publius Cornelius, 237-184 B. C. Roman general; invaded Africa and defeated Hannibal.

Scipio Emililianus Africanus Minor, Publius Cornelius, 185?-129 B. C. Roman general; destroyed Carthage.

Scott, Winfield, 1786-1866. An American general; born in Virginia. He was commander-in-chief of the U. S. Army from 1841 till 1861, and in 1862 was an unsuccessful candidate for the presidency.

Sebastian, Saint. A Roman soldier at Narbonne, and martyred under Diocletian when it was discovered he was a Christian; is depicted in art bound naked to a tree and pierced with arrows; and sometimes with arrows in his hand offering them to Heaven on his knees, he having been first shot with arrows and then beaten to death.

Seeley, Julius Hawley, 1824-1895. An American educator; born in Bethel, Conn. He was president of Amherst College, 1879-1890 and inaugurated the "Amherst system" of self-government, which was productive of good results. He died in Amherst, Mass.

Selkirk, Alexander, 1676-1723. A Scotch adventurer; born in Largo, Scotland; made several voyages to the South Sea, in one of which, having quarreled with his commander, he was put ashore on the island of Juan Fernandez, with a few necessaries, a fowling piece, gunpowder, and shot. Here he lived alone during four years and four months, and was then rescued by Captain Woods Rogers. During the time of his remaining on the island he had nearly forgotten his native language. He returned to England in 1711, and is said to have given his papers to Defoe, who took from them his "story of Robinson Crusoe."

Semiramis. Mythical Assyrian queen; built Babylon and greatly increased her dominions; invaded India, but was defeated.

Semmes (sems), Raphael, 1809-1877. An American naval officer; born in Maryland. He resigned his commission at the outbreak of the Civil War, and became the most daring and successful commander in the Con-

federate service. His vessel, the *Alabama*, was sunk by the United States steamer *Kearsarge*, Captain Winslow, off Cherbourg, France, June 19, 1864, but Semmes and most of his crew escaped on the British yacht *Deerhound*.

Seneca, L. Annaeus, . . . -65. Philosopher; born at Cordova, and brought to Rome when a child; practiced as a pleader at the bar, studied philosophy, and became the tutor of Nero; acquired great riches; was charged with conspiracy by Nero as a pretext, it is believed, to procure his wealth, and ordered to kill himself, which he did by opening his veins till he bled to death; he was of the Stoic school in philosophy, and wrote a number of treatises bearing chiefly on morals.

Sennacherib, A King of Assyria, whose reign extended from 702 to 681 B.C., and was distinguished by the projection and execution of extensive public works; he endeavored to extend his conquests westward, but was baffled in Judea by the miraculous destruction of his army.

Serveus, Michael, 1509-1553. Spanish theologian; martyred through the intolerance of Calvin.

Sesostris, flourished 1400?-1250? B.C. The most celebrated of the early kings of Egypt; he, on succeeding to the throne, became ambitious of military fame, and marched at the head of a numerous army to make the conquest of the world; he marched through Asia, and penetrated farther into the East than the conqueror of Darius; he also invaded Europe; in his old age, he, having grown infirm and blind, destroyed himself. **Sesostris**, so called by the Greeks, is identical with **Rameses II.**, one of the most famous of the Pharaohs.

Severus, Lucius Septimius, 146-211. Roman emperor; born in Leptis Magna, in Africa; was in command in Pannonia, and elected emperor on the murder of Pertinax; subdued a rebellion in Britain, and secured South Britain against invasions from the north by a wall; died at York, England.

Seward, William Henry, 1801-1872. A distinguished American statesman; born in New York; he was governor of his native state, a member of the United States Senate, and secretary of state in President Lincoln's cabinet.

Seymour, Horatio, 1811-1886. American statesman; Democratic nominee for the presidency in 1868.

Shattisbury, Anthony Ashley Cooper, third Earl of, 1671-1718. English philanthropist, author, and free-thinker.

Shaler, Nathaniel Southgate, 1841- An American geologist; born near Newport, Ky.; he served two years as an artillery officer in the Union army during the Civil War; professor of Geology and dean of Lawrence Scientific School; he has written a number of popular scientific works.

Shays, Daniel, 1747-1825. An American captain in the Revolution; born in Massachusetts; died in New York; he became notorious as leader of an abortive rebellion against the state laws of Massachusetts, 1786.

Sheridan, Philip Henry, 1831-1888. American general; victorious at Winchester, Cedar Creek, and Five Forks; made Lieutenant-general, 1869, and promoted to the chief command on retirement of General Sherman, 1883.

Sherman, John, 1823-1900. An American statesman; born in Lancaster, Ohio. Member of Congress, 1855-1861. He took a prominent part in the proceedings of the House; was on the Committee of Inquiry sent to Kansas, and joined the movement for the formation of the Republican party. In 1861-1877 he was in the Senate; was secretary of the treasury, 1877-1881, and superintended the resumption of specie payment in 1879, after a suspension of seventeen years; re-elected to the Senate in 1881 and continued to hold that office till 1897, when he was appointed secretary of state by President McKinley; resigned that office, however, in 1898, on account of failing health. He died in Washington, D. C.

Sherman, Roger, 1721-1793. An eminent American statesman; born in Massachusetts.

Sherman, William Tecumseh, 1820-1891. A distinguished American general; born in Lancaster, Ohio; distinguished himself at the battles of Bull Run and Shiloh; received promotion, and as second in command to Grant rendered valuable service in reducing Vicksburg and Memphis; captured the stronghold of Atlanta, and after a famous march seaward with 65,000 men took Savannah, which he followed up with a series of victories in the Carolinas, receiving, on 26th April, 1865, the surrender of General Johnston, which brought the war to a close; was created general and commander-in-chief of the army in 1869, a position he held till 1883.

Sickles, Daniel Edgar, 1826- Major-gen-

eral U. S. A., retired; born in New York. Was in the state senate, 1856-1867, and in the latter year was elected to Congress, and re-elected in 1869. His bravery in the Civil War was recognized by promotion to major-general. He lost a leg at Gettysburg. He was placed on the retired list of the army, with the rank of major-general, and was United States minister to Spain 1869-1873. He has since been president of the New York State Board of Civil Service Commissioners, commissioner of Emigration, sheriff of New York, and member of Congress.

Siddons, Sarah, 1755-1831. The most distinguished of English tragediennes. She belonged to the Kembles family, noted as actors.

Sidney or Sydney, Algernon, 1622-1683. A noted politician and soldier of extreme republican views; served in Ireland, 1642; returned, joined the Parliamentarians, rose to a colonelcy and command of a regiment in 1645; entered Parliament, and, although appointed one of the commissioners to try Charles I., absented himself from the proceedings, but afterwards approved of the execution; withdrew from politics during Cromwell's Protectorate; intrigued with Louis XIV. against Charles II., assisted William Penn in drawing up the republican constitution of Pennsylvania, was on trumped-up evidence tried for complicity in the Rye House Plot and summarily sentenced to death.

Siemens (see menz), Sir Charles William, 1823-1883. A German engineer; born in Hanover. The great works of Siemens Brothers at Charlton, West Woolwich, for the manufacture of submarine electric telegraph apparatus, were established there in 1869; and the great steel works at Landore, Wales, in 1866. He labored mainly in two distinct fields, the applications of heat and the applications of electricity, and won a great reputation in both. He was knighted, April, 1883, in recognition of his services, which had been previously recognized by numerous scientific societies, and by the Universities of Oxford, Glasgow, Dublin, and Wuerzburg. He died in London.

Sieyes (see ay-yais'), Abbe, 1748-1836. A conspicuous figure all through the French Revolution, the Consulate, and the Empire; represented Paris in the States-General; sat in the center in the Legislative Assembly; renounced the Christian religion in favor of the goddess of Reason; projected a constitution which was rejected; supported Napoleon; fled to Belgium on the return of the Bourbons, and returned to France in 1830, by which time he was politically defunct.

Sigel (see gel), Franz, 1824-1902. An American military officer; born in Sinsheim, Baden. He came to the United States in 1852, and when the Civil War broke out, organized a regiment and went to the front, where he served with unusual distinction, being promoted major-general.

Silliman Benjamin, 1816-1885. An American chemist; born in New Haven, Conn.; he was made professor of Chemistry in the School of Applied Chemistry; delivered the first series of lectures on agricultural chemistry ever given in the United States; was one of the original members of the National Academy of Sciences in 1868. He died in New Haven, Conn.

Simon (se-mon'), Jules Francois, 1814-1886. A French statesman; born in Lorient, Morbihan, Brittany; was a disciple of Victor Cousin, and succeeded him in the chair of philosophy at the Sorbonne; in 1863 he was elected to the Corps Legislatif, where he served till the fall of the empire, when he was placed with Thiers and Gambetta at the head of the provisional government, whose affairs he administered during the siege; from the conclusion of peace in 1871 till the fall of Thiers he was prominent in the Assembly at Bordeaux and at Versailles, and in 1875 was elected a life senator; he died in Paris, France.

Sismondi, Jean Charles Leonard Simonde de, 1773-1842. Celebrated Swiss historian; born at Geneva; the works which have established his reputation are his great histories of "The Italian Republics in the Middle Ages," "European Literature," and "A History of the French."

Sko-beleff, Michael, 1843-1882. A Russian general; distinguished himself by his bravery in the Russo-Turkish War of 1877-1878; was a leader in the Pan Slavist movement; died suddenly.

Slidell, John, 1793?-1871. An American statesman; born in New York; elected to Congress in 1843; made minister to Mexico in 1845, and was in the United States Senate in 1853-1861; in September, 1861, he was appointed a Confederate commissioner to France, where he began negotiating a large loan and is said to have secured the ship *Stonewall* for the Confederate government; after the war he settled in London, England, where he died.

Slocum, Henry Warner, 1827-1894. An American military officer; born in Delphi, Onondaga county, N. Y. When the Civil War broke out he was commissioned a colonel of volunteers in the Union army; was placed in command of a corps on the left wing of General Sherman's army, and took part in the great "march to the sea," leading the left wing of the army from Atlanta to Savannah; he was elected to Congress in 1869 and served till 1873; he died in Brooklyn, N. Y.

Smeaton, John, 1724-1792. An English civil engineer; born in Austhorpe, near Leeds, England. In 1751 he invented a machine for measuring a ship's way at sea, and also a new form of compass. In 1755 he was intrusted with the rebuilding of the Eddystone lighthouse. It stood till 1882, when it was replaced by a new structure. He also perfected Newcomen's steam engine.

Smith, Adam, 1723-1790. Political economist; born in Kirkcaldy, Fife; in 1776 he produced his "Inquiry into the Nature and Causes of the Wealth of Nations," a work to which he devoted ten years of his life, and which has rendered his name world-famous; in 1778 he settled in Edinburgh as commissioner of customs for Scotland, and in 1787 was elected lord rector of Glasgow University; made Political Economy a distinct branch.

Smith, Goldwin, 1823- . . . English man of letters; born in Berks; came to America as professor of English History in Cornell University; in 1871 settled in Canada. He believes that Canada will be annexed to the United States; has written a number of books and pamphlets, one on the "Relations between England and America," and another on "The Political Destiny of Canada"; he is an ultra-Liberal.

Smith, John, Captain, 1579-1631. English explorer; founder of Virginia.

Smith, Joseph, 1806-1844. Founder of the Mormon church.

Smith, William, 1769-1839. The "father of English geology"; born in Churchill, Oxfordshire, England; died in Northampton, England.

Smithson, James, 1765-1829. An English philanthropist; natural son of Hugh Smithson, first Duke of Northumberland; was graduated at Oxford, and elected a member of the Royal Society. In 1835 his property, amounting to \$508,318, came into the possession of the United States government, having been bequeathed by him "for the purpose of founding an institution at Washington, D. C., to be called the Smithsonian Institution, for the increase and diffusion of knowledge among men." He died in Genoa, Italy.

Soci'nus, Faustus, 1539-1604. A theologian; born in Italy; was much persecuted for his opinions; in Cracow, where he dwelt for a long time, he was dragged from a sick-bed half-naked along the street, and his house robbed and his papers burned.

Socrates, 469-399 B.C. Athenian philosopher; pronounced by the Delphic oracle the wisest of men; he lived all his days in Athens, and gathered about him as his pupils all the ingenious youth of the city; he wrote no book, propounded no system, and founded no school, but was ever abroad in the thoroughfares in all weather talking to whoso would listen, and instilling a love of justice and truth; he was charged with not believing in the state religion, with introducing new gods, and corrupting the youth, convicted by a majority of his judges and condemned to die.

Solomon, reigned 977-937 B.C. In Scripture, the third king of Israel; youngest son of David, and the most celebrated of the Hebrew royal line. He is the reputed author of the book of Ecclesiastes, Song of Solomon, Proverbs, and part of the Psalms.

Solon, flourished sixth century B.C. The first Athenian constitutional lawgiver, and one of the Seven Wise Men of Greece.

Solyman (Suleiman), The name of three Turkish Sultans, the most noted being Solyman (the Magnificent), 1496-1566. Succeeded his father, Selim I., 1520. He overran nearly the whole of central Europe, Arabia, and Persia, but was repulsed at the siege of Malta, 1565.

Sothorn, Edward Askew, 1826-1881. Comedian; born in Liverpool; made his mark in Tom Taylor's "Our American Cousin," in which he appeared thousands of times in America and England; scored a great success also as David Garrick.

Soult (woolt), Nicolas Jean de Dieu, 1769-1851. Duke of Dalmatia and marshal of France; gallant conduct in Swiss and Italian campaigns under Massena won him rapid promotion, and in 1804 he was created a marshal; served with the emperor in Germany, and led the deciding charge at Austerlitz; at the head of the French

army in Spain he outmaneuvered the English in 1809, conquered Portugal, and opposed to Wellington a skill and tenacity not less than his own; turned Royalist after the abdication of Napoleon, but on his return from Elba rallied to the emperor's standard, and fought at Waterloo; became active in the public service, and was honored as ambassador in England in 1833; retired in 1845. In 1847 he received the honorary title of "Marshal-General of France."

Soulouque (soo-look'), Faustin, 1785-1867. A negro slave; born in Hayti; died there. He was manumitted when a child, joined the army, rose to be general, was elected president and declared himself emperor, under the title of Faustin I., 1849. He proved a brutal tyrant, and was driven from his throne and the island, 1859.

Souza, John Philip, 1854- . . . An American musician; born in Washington, D. C. He was band leader of the United States Marine Corps, 1880-1892, and in the latter year organized the famous Sousa Band, which gave concerts in England, France, and Germany, and all over the United States. He has composed numerous songs, waltzes, operas, and orchestral suites, but is best known from his marches, which have been republished throughout Europe.

Sparks, Jared, 1789-1866. An American historian; born in Willington, Conn.; he was professor of Ancient and Modern History at Harvard, 1839-1849; president of the college, 1849-1853; and the author of a large number of sermons, biographical and historical works, theological papers, etc., most notably "The Library of American Biography" and "Correspondence of the American Revolution"; he died in Cambridge, Mass.

Spas'mens, Leader of the revolt of the slaves at Rome, which broke out about 73 B.C.; was a Thracian by birth; a man of powerful physique; in succession a shepherd, a soldier, and a general; was slain in battle.

Speke, John Hanning, 1827-1864. An English African explorer; he discovered lake N'yanza, 1858, and discovered the source of the Nile to be that lake, 1862.

Spencer, Herbert, 1820-1903. An English philosopher; born at Derby; about the year 1850 he published his scheme of philosophy, based on the principle of evolution in its relation to life, mind, society, and morals; this large scheme has been only partially fulfilled.

Spinoza (spe-no-zah), Benedict, 1623-1677. Great modern philosopher; born in Amsterdam; left Amsterdam and finally settled at The Hague, where, absorbed in philosophic study, he lived in seclusion, earning a livelihood by polishing optical glasses, which his friends disposed of for him; his days were short; he suffered from ill health, and died of consumption. His great work, his "Ethics," was published about a year after his death.

Spofford, Ainsworth Rand, 1825- . . . An American librarian; born in Gilmanton, N. H. Was librarian of the Congressional Library from 1864 to 1897, when he became chief assistant. Published "The American Almanac" for several years, and, with others, edited "Library of Choice Literature," "Library of Wit and Humor," etc.

Spohr, Ludwig, 1784-1859. Musical composer and violinist; born in Brunswick, Germany; produced both operas and oratorios, "Faust" among the former, the "Last Judgment" and the "Fall of Babylon" among the latter.

Spurgeon, Charles Haddon, 1834-1892. An English preacher; born in Kelvedon, England. His followers built for him his well known "Tabernacle" in Newington Butts, opened in 1861. Spurgeon preached in the Tabernacle every Sunday to thousands of hearers. His sermons were published weekly from 1854, and yearly volumes were issued from 1856. They had an enormous circulation, many of them being translated into various languages. He died in Mentone, France.

Spurzheim, (sports'hime), Johann Gaspar, 1776-1832. Phrenologist; born in Treves; in 1832 he proceeded to America on a lecture tour, but had hardly started on his mission when he died at Boston; he wrote numerous works bearing on phrenology, education, etc.

Standish, Miles, 1584-1656. Captain of Plymouth colony.

Stanford, Leland, 1824-1893. American lawyer and philanthropist; born in Watervliet, Albany county, N. Y.; in 1852 he went to California, where he engaged in mining, but in 1856 removed to San Francisco and there engaged in business, laying the foundation of a fortune estimated at more than \$50,000,000; he was elected president of the Central Pacific railroad in 1861; was governor of California, 1861-1863; and in 1885 was elected to the United States Senate. In memory of a deceased son

Leland Stanford, Jr., he gave \$20,000,000 for the founding of Leland Stanford University at Palo Alto, Cal.; he died in Palo Alto.

Stanford, Jane Lathrop, 1825-1906. An American philanthropist; born in Albany, N. Y.; the wife of Leland Stanford, the founder of the Leland Stanford, Jr. University; she built and endowed the Children's Hospital in Albany, N. Y., at a cost of \$200,000; gave \$160,000 to the kindergartens in San Francisco, Cal., and after the death of her husband in 1898 devoted herself to the development and support of the Leland Stanford University; in 1901 she supplemented her gifts to the university by turning over to its trustees stocks valued at \$18,000,000, her residence in San Francisco, valued at \$400,000, for a museum and art gallery, and 1,000,000 acres of land worth \$12,000,000; these gifts swelled the endowment of the university to more than \$45,000,000, making it the most richly endowed educational institution in the world.

Stanley, Arthur Penrhyn, 1815-1881. Widely known as Dean Stanley; born at Alderley, in Cheshire, England; held a professorship of Ecclesiastical History in Oxford for a time, and published lectures on the Eastern Church, the Jewish Church, the Athanasian Creed, and the Church of Scotland; accompanied the Prince of Wales to the East in 1862, and became dean of Westminster 1864, in succession to Trench; wrote "Historical Monuments of Westminster Abbey" and "Christian Institutions."

Stanley, Henry Morton, 1841-1904. African explorer; born in Denbigh, Wales, his parental name being Rowlands, he having assumed the name of Stanley after that of his adopted father, Mr. Stanley, New Orleans; served in the Confederate army; became a newspaper foreign correspondent to the *New York Herald*; at length was summoned to go and "find Livingstone"; after many an impediment found Livingstone on 10th November, 1871, and after staying with him, and accompanying him in explorations, returned to England; published "Congo and its Free State," "In Darkest Africa," etc.; elected to the British Parliament, 1896.

Stanton, Edwin McMasters, 1814-1869. An American statesman; born in Steubenville, Ohio; appointed attorney-general of the United States; succeeded Simon Cameron as secretary of war and held that office for six years. On December 20, 1869, he was nominated by President Grant as an associate justice of the Supreme Court of the United States, but died before taking his seat.

Stanton, Elizabeth Cady, 1815-1902. An American reformer; born in Johnstown, N. Y.; called the first Woman's Rights Convention in Seneca Falls, N. Y., in 1848, and was an unsuccessful candidate for Congress in 1868. She was the author of "The History of Woman Suffrage," and other works.

Stark, John, 1728-1822. An American military officer; born in Londonderry, N. H.; joined the troops under Major Rogers in the war against the French and Indians in 1755; rendered efficient service at Ticonderoga in 1758, and was actively employed in the subsequent campaign. In 1775, after the battle of Lexington, he received a colonel's commission, and recruited a regiment which formed the left of the American line at Bunker Hill. For his victory at Bennington he was promoted brigadier-general. He died in Manchester, N. H.

Stein, Heinrich Friedrich Karl von, Baron, 1757-1831. Prussian statesman.

Stephen, Saint. Stoned 367; first Christian martyr.

Stephens, Alexander Hamilton, 1812-1883. American statesman and writer; the "Nestor of the Confederacy"; born in Georgia; admitted to the bar, 1835; Congress, 1843; opposed the secession of his state; vice-president of the Confederate States; elected to the United States Senate from Georgia, but not permitted to take his seat; member of the House of Representatives, however, from 1874 until his death.

Stephenson, George, 1781-1848. English engineer; inventor of the locomotive engine.

Stephenson, Robert, 1803-1869. Son of George Stephenson; English engineer; inventor of tubular bridge.

Steuben, Frederic William Augustus, Baron, 1730-1794. An American military officer; born in Magdeburg, Prussia. He came to America in 1777, and having received the appointment of inspector-general, with the rank of major-general, he proved of efficient service to the American army. For his services and sacrifices Congress in 1790 voted him an annuity of \$2,400 and a township of land in the state of New York, both of which he divided with his fellow officers. He died on his estate near Utica, N. Y.

Stevens, Thaddeus, 1792-1868. An American statesman; born in Danville, Vt. In 1848 and also in 1850 he was elected to Congress from Pennsylvania, and again in 1858, retaining his seat till his death.

Stewart, Alexander Turney, 1808-1876. An American merchant; born near Belfast, Ireland; came to the United States in 1823 and engaged in teaching. In 1825 he began, in New York city, a dry goods business which gradually expanded into one of the largest mercantile concerns in the world. He died in New York.

Stewart, Dugald, 1768-1858. Scottish philosopher; born in Edinburgh; he wrote "Elements of the Philosophy of the Human Mind," "Philosophical Essays," etc.

Stone, Lucy (Mrs. Blackwell), 1818-1898. An American reformer; born in West Brookfield, Mass. She was graduated at Oberlin College in 1847. She published a protest, "Taxation Without Representation." In 1869 she helped organize the American Woman's Suffrage Association. Her lectures on woman suffrage made her known throughout the country. She died in Boston.

Story, Joseph, 1779-1845. An American jurist; born in Marblehead, Mass. In 1811 he was appointed an associate justice of the United States Supreme Court, and held the office till his death. He wrote extensively on jurisprudence. He died in Cambridge, Mass.

Story, William Wetmore, 1819-1896. Poet and sculptor; son of preceding. He died in Vallombrosa, near Florence, Italy.

Strabo, 63? B.C.-24? A.D. A noted geographer; born in Amasea, Pontus; his geography in seventeen books has been preserved entire with the exception of the seventh book, of which there is only an epitome; the first two books are introductory, the next eight treat of Europe, the six following of Asia, and the last of Africa.

Stradivari, Antonio (Stradivarius), 1649?-1737. An Italian violin maker; born in Cremona, Italy; it was he who settled the typical pattern of the Cremona violin, and his instruments, for tone and finish, have never yet been excelled; he died in Cremona.

Strauss, Johann, 1825-1899. An Austrian musician; born in Vienna; after composing dance music for many years, he undertook an operetta, "Indigo," which was produced in 1871, and met with instantaneous success; subsequently he produced "The Forty Thieves," "Cagliostro," "The Gypsy Baron," etc., and numerous waltzes, the best known being "The Beautiful Blue Danube"; he died in Vienna.

Stuart, Gilbert Charles, 1755-1828. An American painter; born in Narragansett, R. I.; in 1775 he made his way to London, where he led for two years a Bohemian life; upon his talent being recognized, he became a fashionable portrait painter; in 1792 he returned to the United States, and painted portraits of Washington, Jefferson, Madison, John Adams, and many of the distinguished men of the period; he died in Boston.

Sulla or Sylla, Lucius Cornelius, 138-78 B.C. Roman statesman and general.

Sumner, Charles, 1811-1874. American statesman and abolitionist; born in Boston; was brought into public notice by his fourth of July oration, 1845, on "The True Grandeur of Nations," an eloquent condemnation of war; was one of the founders of the Free Soil Party, and in 1851 was elected to the United States Senate, a position he held until the close of his life.

Swedenborg, Emanuel, 1688-1772. Swedish theosophist; in his theosophy the central point is the correspondence of the natural and the supernatural. He was founder of the sect known as the Swedenborgians or the Church of New Jerusalem.

Tait, Archibald Campbell, 1811-1882. Archbishop of Canterbury; born in Edinburgh, Scotland. In 1842 he was appointed successor to Dr. Arnold as head master of Rugby; in 1849 became Dean of Carlisle, and in 1856 Bishop of London, as successor to Blomfield. In 1868 he was made primate of all England by Mr. Disraeli. The Lambeth Conference of 1878 took place under his auspices.

Talleyrand (de l'heron') de Perigord, Charles Maurice, Prince of Benevento, 1754-1838. French statesman and diplomatist; born in Paris; was educated for the Church; made bishop of Autun; was excommunicated by the pope, resigned his bishopric, and embarked on a statesman's career. In 1797 was appointed minister of foreign affairs; supported Bonaparte in his ambitious schemes, and on the latter becoming emperor, was made grand chamberlain and Duke of Benevento, while he retained the portfolio of foreign affairs; disapproving Napoleon's course toward England, 1807, he resigned. He refused to accept office again when twice recalled; he attached himself to the Bourbons on their return, and,

becoming foreign minister to Louis XVIII., was made a peer, and sent ambassador to the Congress of Vienna; retired from public life shortly before his death.

Talmage, Thomas De Witt, 1832-1902. An American clergyman; born in Bound Brook, N. J. He was pastor of the Central Presbyterian Church in Brooklyn, N. Y., in 1869-1894, and afterward became associate pastor of the First Presbyterian Church in Washington, D. C. He was for many years the editor of the *Christian Herald*, and was the author of "Crumba Swept Up," "Woman: Her Powers and Privileges," "From Manger to Throne," "Every-Day Religion," etc. He died in Washington, D. C.

Talma, Francois Joseph, 1763-1828. A famous French tragedian; born in Paris; during the Revolution he was the foremost actor at the Theatre de la Republique, and subsequently enjoyed the favor of Napoleon; his noble carriage and matchless elocution enabled him to play with great dignity such characters as Othello, Nero, Orestes, Leicester, etc.

Tamerslane, or Tamar, 1336-1405. A great Asiatic conqueror; born at Kesh, near Samarcand; the son of a Mongol chief; raised himself by military conquest to the throne of Samarcand; built up an empire that at the time of his death extended from the Ganges to the Grecian Archipelago; died while leading an expedition against China.

Tancred, 1050-1112. A famous crusader; hero of Tasso's great poem; for great deeds done in the First Crusade he was rewarded with the principality of Tiberius; stands as the type of "a very gentle, perfect knight"; died at Antioch of a wound received in battle.

Taney (tan'ni), Roger Brooke, 1777-1864. An American jurist; born in Calvert county, Maryland; succeeded John M. Berrien as attorney general of the United States; was appointed secretary of the treasury under President Jackson, but was forced to resign; was nominated chief-justice of the United States and confirmed by the United States Senate March 15, 1836; while in this office he rendered decisions on many important cases, notably those of Dred Scott, and Sherman M. Booth, both bearing on the Fugitive Slave Law; he died in Washington, D. C.

Tarquinius, Lucius Priscus, . . . 578 B. C. The fifth king of Rome, and first of the Tarquin kings; crowned 614 B. C.; **Tarquinius, Lucius Superbus**, his grandson, married two sisters, daughters of Servius Tullius, whom he assassinated at the instigation of his later wife, 534 B. C.; **Tarquinius, Sextus**, his son, the notorious hero of the rape of Lucretia, was the last of the race, and with his expulsion, 510 B. C., Rome became a republic.

Taylor, Bayard, 1825-1878. A noted American writer and traveler; born at Kennett Square, Pa.; for a number of years contributed, as travel correspondent, to the *Tribune*, visiting in this capacity Egypt, the greater part of Asia, Central Africa, Russia, Iceland, etc.; during 1862-1863 acted as secretary of the legation at St. Petersburg; and in 1878 was appointed ambassador at Berlin; his literary reputation rests mainly on his works of travel; also on "Poems of the Orient," "Rhymes of Travel," and an admirable translation of Goethe's "Faust."

Taylor, Zachary, 1774-1850. American general and statesman; twelfth president of the United States; born in Virginia; entered the army in 1808; served in Seminole and Black Hawk wars; major-general in Mexican War, and won the battles of Resaca de la Palma and Buena Vista; elected president by the Whigs in 1848.

Tecumseh, 1770-1813. Chief of the Shawnee Indians; defeated by Harrison at Tippecanoe; killed in the battle of the Thames.

Tell, Wilhelm, flourished 1305; legendary Swiss hero; said to have been drowned in the Schaechen, in attempting to save the life of a friend.

Temple, Sir William, 1628-1699. An English statesman; born in London. In conjunction with DeWitt he concluded the treaty between England, Holland, and Sweden. Latterly lived in epicurean ease, in the enjoyment of his garden, and in the pursuit of letters at his villa at Sheen, and, after 1686, at Moor Park, in Surrey, where he had Swift for secretary.

Teniers, David (The Elder), 1582-1649. An eminent Dutch painter. **Teniers, David (the Younger)**, 1610-1690. Son of the preceding; he excelled his father. Both were pupils of Rubens.

Terry, Ellen Alice, 1848- . . . An English actress; born in Coventry, England, and made her first appearance on the stage during Charles Kean's Shakespearean revivals in 1856. In 1864 she married and left the stage, but reappeared again in October, 1867. She accompanied

Henry Irving on his numerous American tours, playing with unprecedented success all over the United States. **Tertullian, Quintus Septimius Florens**, 150-230. One of the Latin fathers; born at Carthage; was converted to Christianity; became presbyter of Carthage, and embraced Montanist views; wrote numerous works, apologetical, polemical, doctrinal, and practical, the last of an ascetic tendency.

Tetzel, John, 1455-1519. A Dominican monk; born at Leipsic; was employed in the sale of indulgences to all who subscribed to the fund for building St. Peter's at Rome; in opposition to him and his doings Luther published his celebrated theses in 1517.

Thalberg (tash'burg), Sigismund, 1812-1871. A celebrated pianist; born at Geneva; took rank as one of the most brilliant pianists of the age.

Thales, flourished seventh century B. C. Philosopher of Greece, and one of her seven sages; was a philosopher of the physical school, and the father of philosophy in general.

Themistocles, 520-453 B. C. Celebrated Athenian general and statesman; rose to political power on the ostracism of Aristides, his rival; fought at Salamis and routed the fleet of Xerxes.

Theodora, 508-548. The famous consort of the Byzantine emperor, Justinian I.; she became Justinian's trusted counselor, bore a chief share in the work of government, and saved the throne by her high courage at the crisis of the Nika riots. She lavished her bounty on the poor, and especially on the unfortunate of her own sex.

Theodoric (the Great), 457-526. A king of the Goths, who, after the fall of the Western Empire, ruled as king of Italy, 493-526.

Theodosius. The name of three emperors. **Theodosius I. (Flavius)**, 347-395. Surnamed "The Great"; born in Spain; reigned 379-395. With the close of his reign the disintegration of the Roman Empire set in. He was the author of the bloody massacre of Thessalonica for which Ambrose, the fearless archbishop of Milan, compelled him to do penance. **Theodosius II.**, 401-450. His grandson; succeeded his father Arcadius as emperor of the East. **Theodosius III. (Adramyttenus)**, 654-717. Succeeded Anastasius II. as emperor of the East; crowned 716.

Theophrastus, . . . 286 B. C. A peripatetic philosopher; born in Lesbos; pupil, heir, and successor of Aristotle, and the great interpreter and expounder of his philosophy.

Theresa, Saint, 1515-1582. A Spanish Carmelite nun; eminent for learning and piety; founder of a reformed society of barefooted members of that order; canonized by Pope Gregory XV.

Thierry (tey'ree), Amedee Simon Dominique, 1797-1878. A distinguished French historian; his brother, **Jacques Nicolas Augustin**, 1795-1856, was even more eminent as an author.

Thiers (teir'), Louis Adolphe, 1797-1877. An eminent French statesman and historian. He was the first president of the Republic, elected 1871, resigned 1873, and succeeded by Marshal MacMahon.

Thomas, George Henry, 1816-1870. American Federal general; his greatest battles were Chickamauga and Nashville.

Thomson, Sir William, Lord Kelvin, 1824- . . . Great British physicist; born at Belfast; professor of Natural Philosophy in Glasgow in 1846; it is in the departments of heat and electricity he has accomplished his greatest achievements; he has invented a number of ingenious and delicate scientific instruments, and written extensively on mathematical and physical subjects.

Thorwaldsen, Bertel, 1770-1844. An eminent Danish sculptor; born near Copenhagen, the son of a poor Icander; studied in Rome, where Canova encouraged him, and a fine statue of Jason established his reputation; executed a colossal group of "Christ, the Consoler," "The Twelve Apostles," "St. John Preaching in the Wilderness," and other religious subjects, besides statues of Copernicus and Galileo, and the celebrated reliefs, "Night" and "Morning"; bequeathed to his country his large fortune and nearly 800 of his works, now in the Thorwaldsen Museum, Copenhagen.

Thurman, Allen Granberry, 1813-1895. An American jurist; born in Lynchburg, Va.; elected to Congress in 1844; chosen judge of the Supreme Court of Ohio in 1851, and was elected United States senator in 1869 and 1874, where he became leader of the Democratic side; vice-president of the United States, 1889-1893. Popularly known as "The Old Roman." He died in Columbus, Ohio.

Tiberius, -37 A. D. Second Roman emperor; born at Rome; his reign was distinguished by acts of cruelty; given up to debauchery, he was suffocated in a fainting fit by the captain of the Prætorian Guards, and succeeded by Caligula; it was during his reign Christ was crucified.

Tilden, Samuel Jones, 1814-1886. American statesman; born at New Lebanon, N. Y.; Mr. Tilden became leader of the Democratic party in New York state in 1868, and in that capacity strenuously opposed the corrupt administration of the Tweed faction; in 1874 he was elected governor of New York, and during his term of office broke up the notorious "canal ring"; in 1876 he was nominated for the presidency by the National Democratic Convention; died in "Greystone," his country seat, near Yonkers, N. Y.

Tilly, Johann Tzerklas von, Count, 1559-1632. German general in Thirty Years' War; fell at the battle of the Lech.

Timoteo, Giacomo Robusti, Il, 1512-1594. Italian painter; born at Venice; save for a few lessons under Titian he seems to have been self-taught; took for his models Titian and Michael Angelo, and came specially to excel in grandeur of conception and in strong chiaroscuro effects; among his most notable pictures are "Belshazzar's Feast," "The Last Supper," "The Crucifixion," "The Last Judgment," "The Resurrection," etc.

Tischendorf, Constantia von, 1815-1874. Biblical scholar; born in Saxony; spent his life in textual criticism; his great work "Critical Edition of the New Testament."

Titian (tish'yan), Vecellio, 1477-1576. Great Italian painter; born at Pieve del Cadore; the prince of colorists, and head of the Venetian school; he was a master of his art from the very first, and his fame led to employment in all directions over Italy, Germany, and Spain; his works were numerous, and rich in variety; he ranks with Michael Angelo and Raphael as the head of the Italian renaissance.

Titus, Flavius Sabinus Vespasianus, flourished first century A. D. A Roman general and emperor; before he ascended the throne he captured and destroyed Jerusalem, 70.

Todleben, Eduard Ivanovitch, 1818-1884. A noted Russian general of German descent; greatly distinguished himself by his defensive operations at Sebastopol during its siege by the French and English in the Crimean War, and subsequently by the reduction of Plevna, his greatest achievement, which brought to a close the war with Turkey in 1877; subsequently became commander-in-chief in Bulgaria.

Tome, Jacob, 1810-1898. An American philanthropist; born in Manheim township, York county, Pa.; went to Port Deposit, Md., in 1833. In 1834 he presented to Dickinson College a valuable building for scientific uses. His largest gift was for the foundation of the Jacob Tome Institute, at Port Deposit, \$1,600,000, a sum that was increased by his will to more than \$3,500,000. He died in Port Deposit, Md.

Tompkins, Daniel D., 1774-1825. An American statesman; born in Fox Meadows, Westchester county, N. Y.; elected to Congress, 1804, but he resigned to become judge of the Supreme Court of New York; governor, 1807-1817, and vice-president of the United States, 1817-1825. He died on Staten Island, N. Y.

Toombs, Robert, 1810-1885. An American statesman; born in Wilkes county, Georgia; was a Whig member of Congress from Georgia, 1845-1853, and a United States senator, 1853-1861. He was expelled from the Senate in 1861, and in the same year was elected to the Confederate Congress and also became Confederate secretary of state. He resigned to become a brigadier-general in the Confederate army. He died in Washington, Ga.

Torquemada, Tomas de, 1420-1498. Spanish Dominican monk; inquisitor-general.

Torricelli (tor-ri-chel'li), Evangelista, 1608-1647. Italian physicist; he invented the barometer.

Tourville, Anne Hilarion de Cotteville, Comte de, 1642-1701. A distinguished French admiral and marshal.

Toussaint L'Ouverture (too-sahn' too-ver-tooer'), 1743-1803. A negro general and president of Hayti; in the insurrection and massacre of the whites, 1791, he was the leader, and was afterward elected president for life. Treacherously arrested by General Leclerc, 1802, while negotiations were in progress, he was carried to France and held a state prisoner till his death.

Trajan, Marcus Ulpius, 52-117. Roman emperor; born in Spain; ruled the empire with wisdom and vigor, set right the finances, upheld an impartial justice, and

set on foot various schemes of improvement; suppressed the Christians as politically dangerous, but with no fanatic extravagance; is said to have erected the famous Trajan Column, which still stands in Rome.

Trevithick, Richard, 1771-1833. An English inventor; born in Illogan, Cornwall. He perfected a high-pressure steam engine, and began to experiment in the construction of locomotive engines. Passengers were first conveyed by steam by means of his road locomotive in 1801, and he soon after successfully worked a tram-road locomotive. His ideas were afterward taken up and developed by Stephenson. He was the first to recognize the value of iron in ship building, and the application of steam to agriculture. He died in Dartford, Kent.

Trumbull, John, 1756-1843. An American artist; born in Lebanon, Conn.; served in the Revolutionary War on the staffs of Generals Washington and Gates; became a pupil of Benjamin West; in 1786 he produced his first historical picture, "The Battle of Bunker Hill"; in 1817 he was employed by Congress to paint four pictures for the rotunda of the Capitol at Washington. He died in New York city.

Trumbull, Jonathan, 1710-1785. An American patriot; born in Lebanon, Conn.; took a very prominent part in forwarding the Revolutionary War; Washington placed great reliance on him, and frequently consulted him; to this habit, and his phrase, often repeated when in doubt, "Let us hear what Brother Jonathan says," has been traced the name which stands for a personification of the United States.

Truxton, Thomas, 1755-1822. An American naval officer; born in Long Island, N. Y.; he was made a lieutenant in the navy and assigned to the *Congress*; in all of his engagements with the enemy he was uniformly victorious; placed in command of the *Constellation*, and was ordered to protect American commerce in the West Indies; in February, 1798, he fought a severe battle with the powerful French ship *L'Insurgente*, and captured her after killing twenty-nine of her crew and wounding forty-four; in January, 1800, he defeated the French frigate *La Vengeance*; in 1802 he was assigned to command a fleet to participate in the war with Tripoli, and went to Norfolk to join the *Chesapeake*; about the same time he requested the appointment of a captain for his flagship; his letter was taken to mean his resignation, which was accepted against his wishes; he died in Philadelphia, Pa.

Turenne (too-ren'), Henri de la Tour d'Auvergne, Viscount de, 1611-1675. The greatest military commander of his age; grandson of William the Silent, Prince of Orange; born at Sedan, France; accidentally killed by a shot while reconnoitering an intended battlefield. In the civil wars of France, he fought first on the Protestant side and afterward on the Catholic.

Turner, Joseph Mallord William, 1775-1851. English landscape painter.

Tyler, John, 1790-1862. Tenth president of the United States; born in Virginia; practiced law; in Congress, 1816-1821; governor of Virginia, 1825; senator, 1827; opposed nullification but condemned Jackson's course in 1832; resigned, 1836; elected vice-president on Whig ticket, 1840; succeeded Harrison in 1841.

Tyndall, John, 1820-1893. An English physicist; born in Leighlin Bridge, near Carlow, Ireland. In 1872 he lectured in the United States; the profits of which he devoted to a fund "in aid of students who devote themselves to original research." He died in Haslemere, Surrey, England.

Ulloa, Antonio, Don, 1716-1795. A distinguished Spanish statesman, mathematician, and author. He was appointed governor of Louisiana, 1764.

Ulpian, or Ulfias, 218-283. The apostle of the Goths; translated the Scriptures into Gothic.

Unger, Johann Friedrich, 1750-1813. German printer and engraver.

Urban. The name borne by eight popes. **Urban II.**, 1088-1099. Urged the First Crusade, 1095. **Urban VI.**, 1378-1389. Clement VII. was elected at the same time, and held sway at Avignon, originating the "western schism" which divided the church for nearly half a century.

Ursula, Saint. A traditional virgin martyr; reputed daughter of a British prince, who, with eleven thousand other virgins, suffered cruel martyrdom at Cologne in the third or fourth century.

Urquhart, David, 1805-1877. Scotch writer and politician.

Ussher, James, 1580-1656. Irish prelate and scholar.

Valens, Flavius, 328-378. Emperor of the East from 364 to 378; nominated by his brother, Valentinian I., emperor of the West; was harassed all his reign by the Goths.

Valette', Jean Parisot de la, 1494-1568. Grand-master of the order of St. John; famous for his military exploits and for his defense of Malta against the Turks in 1565.

Vallan'digham, Clement Laird, 1820-1871. An American politician; born in New Lisbon, Ohio; was a member of Congress, 1858-1863, and during the Civil War was a strong friend of the Southern Confederacy. He was arrested in May, 1863, by United States troops, on a charge of uttering disloyal sentiments, was tried by court-martial, and sentenced to confinement till the end of the war. This was afterward commuted to banishment to the Confederate lines. He died in Lebanon, Ohio.

Van Buren, Martin, 1782-1862. Eighth president of the United States; enrolled at the bar in New York in 1806, and elected to the state senate; state attorney-general, 1815; leader of the Albany Regency; United States senator, 1821; governor, 1828; secretary of state, 1829-1831; vice-president, 1833-1837; president, 1837-1841.

Vancouver, George, 1758-1798. English navigator.

Vanderbilt, Cornelius, 1794-1877. American capitalist.

Vandyke, or Van Dyck, Sir Anthony, 1599-1641. Flemish painter; resided in England for several years before his death, where he became the most popular artist of his time.

Vane, Sir Henry, 1613-1662. English republican statesman.

Van Benschelae, Stephen (the Patroon), 1764-1839. American statesman and landholder.

Varus, Publius Quintilius. Flourished 7 A.D. Roman general; defeated by Arminius.

Vauban (w'ban), Sebastien le Prestre, Seigneur de, 1633-1707. Marshal of France, and the greatest military engineer of that country; entered the army, where he rose to the highest military rank by his merit and services. He was made governor of the citadel of Lille in 1668, commissioner-general of fortifications in 1678, and marshal of France in 1708. He died at Paris. As an engineer he carried the art of fortification to a degree of perfection unknown before his time. He strengthened and improved above 300 citadels, erected thirty-three new ones, and directed fifty-three sieges.

Veit (vite), Philipp, 1798-1877. Painter of the Romanticist school; born at Berlin; his best known work is a fresco, "Christianity bringing the Fine Arts to Germany."

Velazquez, Diego de Silva, 1599-1660. Greatest of Spanish painters; born at Seville, of Portuguese family; portrait painting was his forte, one of his earliest being a portrait of Olivarez, succeeded by those of Philip IV., Juan Pareja, and Innocent X. Specimens of his work are found in different countries, but the best are in Madrid, Spain; they include sacred subjects, genre, landscape, and animal paintings, as well as portraits.

Velde, Willem van der (the Elder), 1611-1693. Dutch marine painter.

Velde, Willem van der (the Younger), 1633-1707. Dutch marine painter.

Verboeckhoven (ver-book'ho-ven) Eugene Joseph, 1799-1881. Belgian painter.

Verdi Giuseppe, 1813-1901. Italian composer; born at Roncole, Parma; his musical talent was slow of recognition, but the appearance of his "Lombardi" and "Ernani" established his repute, which was confirmed by "Rigoletto," "Il Trovatore," and "La Traviata."

Verestchagin (va-res-tchag'in), Vassili, 1842-1904. Russian painter; realistic to an extreme degree, and anti-conventional; confined himself largely to martial subjects; perished with the sinking battleship *Petrovavlovsk* at the siege of Port Arthur.

Vernet (ver-nay'), Claude Joseph, 1714-1789. A distinguished French marine painter. His son, Antoine Charles Horace, 1758-1836, was eminent as a painter of battle scenes. Horace, 1789-1863, son of the latter, excelled his father in the painting of battle scenes, and ranks as the first French artist of his age.

Veronese (va-ro-na'se), Paolo, 1528-1588. Painter of the Venetian school; born at Verona; painted his "Temptation of St. Anthony" for Mantua Cathedral, and settled in Venice in 1555, where he soon earned distinction and formed one of a trio along with Titian and Tintoretto; the subjects he treated were mostly scriptural, the most celebrated being the "Marriage Feast at Cana of Galilee."

Vesalius, Andreas, 1514-1564. An eminent anatomist and surgeon; born at Brussels.

Vespasian (Titus Flavius Vespasianus), 9-79. Roman emperor from 69 to 79, and tenth of the twelve Cæsars; born in the Sabine territory, of humble parent-

age; rose by his valor to high rank in the army and in favor with it, till at length he was elected by it to the throne.

Vespucci (ves-poot'chee), Amerigo (ah-ma-red'go), 1451-1512. Navigator; born at Florence, Italy; made two voyages to America in 1497 and in 1501. He wrote a description of his exploration of South America and it was suggested that since he had first made the new continent known it should be named America.

Victor Emmanuel I., 1759-1824. Brother of Charles Emmanuel IV., King of Sardinia, who abdicated in his favor; crowned 1802; abdicated in favor of his brother, Charles Felix, 1821. **Victor Emmanuel II.**, 1820-1878. Succeeded his father, Charles Albert, 1849, and became king of Italy, 1861.

Victoria Alexandrina, 1819-1901. Queen of Great Britain and Ireland, and Empress of India; daughter of Edward, Duke of Kent, fourth son of George III.; succeeded her uncle, William IV., 1837; married Albert of Saxe-Coburg-Gotha, 1840, who died 1861. Victoria assumed the title Empress of India, 1876, by act of Parliament.

Vinci (vin'che), Leonardo da, 1452-1519. Florentine painter.

Vladimir (the Great), 949-1015. Grand Duke and first Christian ruler of Russia.

Vol'ta, Alessandro Comte, 1745-1827. An eminent Italian chemist and natural philosopher; inventor of the Voltaic pile.

Wade, Benjamin Franklin, 1800-1878. An American statesman; born in Massachusetts. He represented Ohio in the United States Senate for many years.

Wagner, Wilhelm Richard, 1813-1883. Great musical composer; born at Leipzig; his principal works were "Rienzi," "The Flying Dutchman," "Tannhauser," "Lohengrin," "Tristan and Isolde," "The Mastersingers of Nuremberg," and the "Ring of the Nibelungen," the composition of which occupied twenty-five years; this last was performed in 1876 at Bayreuth, in presence of the emperor of Germany and the principal musical artists of the world; "Parsifal" was his last work.

Waite, Morrison Remick, 1816-1888. An American jurist; born in Lyme, Conn.; in 1850 moved to Toledo, Ohio; in 1871 was appointed one of the attorneys to represent the United States before the tribunal of arbitration at Geneva; nominated by President Grant to be chief-justice of the United States Supreme Court in 1874, and was unanimously confirmed by the Senate; died in Washington, D. C.

Waldemar I. (the Great), 1181-1181. King of Denmark. He conquered southern Norway and Wendish Germany. **Waldemar II.**, . . . -1241. Second son of the former; succeeded his brother Canute VI. **Waldemar III.**, . . . -1375. Crowned 1340.

Walker, William, 1824-1860. A noted filibuster; born in Tennessee; captured and shot at Truxillo, Central America.

Wallace, Alfred Russell, 1822- . . . An English naturalist; born in Usk, Monmouthshire, England; spent many years in traveling, especially in South America and the Asiatic islands. His observation of animal life early led him on the track of natural selection, and before Darwin gave his famous work to the world he had published "Speculations on the Origin of Species." He wrote many scientific and popular books and papers.

Wallace, Sir William, 1270?-1305. Scotch general and patriot; defeated by Edward I. of England; betrayed and executed.

Wallenstein, Albrecht Wenzel Eusebius von, Count, 1583-1634. Austrian general; hero of one of Schiller's dramas; entered the imperial army at the beginning of the Thirty Years' War; raised an army at his own expense in 1625, invading Denmark; banished from court by Emperor Ferdinand, but recalled on the death of Marshal Tilly; defeated by Gustavus Adolphus at Lutzen in 1632, but gained several victories in Silesia; again lost the emperor's favor, being charged with aspirations to the throne of Bohemia, was deprived of his command and assassinated.

Walpole, Sir Robert, Earl of Orford, 1676-1745. An English statesman; born in Houghton, England. He was secretary of war and leader in the House of Commons in 1708; paymaster of the forces in 1714 and 1720, and first lord of the treasury and chancellor of the exchequer in 1715, and again in 1721, and prime minister from 1715-1717 and from 1721-1742. During his long

administration the Hanoverian succession, to which he was zealously attached, became firmly established. He died in Houghton, England.

Warburton, William, 1698-1779. An English divine; born at Newark; was bishop of Gloucester; was author of the famous "Divine Legation of Moses," characterized by Gibbon as a "monument of the vigor and weakness of the human mind"; a singular friendship subsisted between the author and Pope.

Ward, Henry Augustus, 1834- . . . An American naturalist; born in Rochester, N. Y.; was professor of Natural Sciences in Rochester University, 1860-1865; and manager of gold mines in Montana and South Carolina, 1866-1869. In 1870 he began to travel in various countries, making large and valuable cabinets of mineralogy and geology, which he distributed among the universities and colleges of the United States.

Warren, Joseph, 1741-1775. American physician; Revolutionary general and patriot; fell at Bunker Hill.

Warwick, Richard Neville, Earl of (the king maker), 1428-1471. English warrior; set up and deposed Edward IV.

Washington, Booker Taliaferro, 1859- . . . An American educator; born a slave in Hale's Ford, Va. After the Civil War he removed to West Virginia, where he worked in the mines, attending school in the winter. In 1875 he was graduated with honors at the Hampton Institute, Va.; was a teacher there from 1879-1881, when he was elected by the state authorities of Alabama principal of the Tuskegee Normal and Industrial Institute, which he organized and built up. He received the degree of A. M. from Howard University in 1896.

Washington, George, 1732-1799. Commander-in-chief in the American Revolution, and first president of the United States; "the father of his country"; born in Virginia; aid-de-camp to Braddock in the Indian campaign of 1755; married Martha Custis, 1759; chosen to Congress, 1774; appointed commander-in-chief of the colonial army in 1775; his first important operation in that capacity was to drive the English out of Boston, but, the British rallying, he was defeated at Brandywine and Germantown in 1777; next year, in alliance with the French, he drove the British out of Philadelphia, and in 1781 compelled Cornwallis to capitulate in an attack he made on Yorktown, and on the evacuation of New York by the British the independence of America was achieved, upon which he resigned the command; in 1789 he was elected to the presidency of the Republic, and in 1793 was re-elected, at the end of which term he retired into private life after paying a dignified farewell.

Watt, James, 1736-1819. Scotch engineer and inventor; improved and completed the steam engine; also credited with the discovery of the composition of water.

Watteau (wat-toe), Antoine, 1684-1721. A distinguished French painter.

Watts, George Frederick, 1817- . . . Eminent English painter; born in London; is distinguished as a painter at once of historical subjects, ideal subjects, and portraits; did one of the frescoes in the Poets' Hall of the Houses of Parliament and the cartoon of "Caractacus led in Triumph through the Streets of Rome"; has, as a "poet-painter," by his "Love and Death," "Hope," and "Orpheus and Eurydice," achieved a world-wide fame; he was twice offered a baronetcy, but on both occasions he declined.

Wayland, Francis, 1796-1865. An eminent American divine and educator; of the Baptist denomination; born in New York; for 28 years president of Brown University.

Wayne, Anthony, 1745-1796. An eminent American general; born in Pennsylvania. He was the hero of the assault and capture of Stony Point, 1779, and at the close of the Revolution led successful campaigns against the Southern and Western Indians.

Weber, Karl Maria Friedrich Ernst von, Baron, 1786-1826. German musical composer.

Webster, Daniel, 1782-1852. American lawyer, orator, and statesman; "the expounder of the Constitution"; born in New Hampshire; in Congress, 1812-1816, 1822-1823; in Senate, 1823-1841; secretary of state; re-entered Senate in 1844; again became secretary of state in 1850; nominated for the presidency in 1854, but defeated; candidate for the Whig nomination in 1848, but defeated by Taylor, whom he supported; Webster's reply to Hayne, of South Carolina, is considered the greatest speech ever made in Congress.

Webster, Noah, 1758-1843. Lexicographer; born at Hartford, Conn.; bred to law; tried journalism; devoted twenty years to his "Dictionary of the English language."

Wedgwood, Josiah, 1730-1795. Celebrated English potter; born at Burslem; in 1769 started a pottery on artistic lines in his native place; had the good fortune to enlist Flaxman as a designer, and so a ware known by his name became famous for both its substantial and artistic excellence; he was a man of varied culture and of princely generosity, having by his art amassed a large fortune.

Weed, Thurlow, 1797-1882. An American journalist; born in Cairo, N. Y.; served as a private in the War of 1812; in 1830 he founded the *Albany Evening Journal*, an anti-Jackson, Wm. or Republican paper, which became the organ of the party, and which he controlled for thirty-five years; supported Lincoln and the Civil War, and went for him on a mission to Europe, 1861-1862; he died in New York city.

Weismann (vay-mahn), August, 1834- . . . German biologist; born at Frankfurt-on-the-Main; it is with the discussions on the question of heredity that his name is most intimately associated.

Wellington, Arthur Wellesley, first Duke of, 1769-1852. Greatest of British generals; gained great distinction in India, in the war against the Marhattas; major-general, 1802; Parliament, 1806; secretary for Ireland, 1807; defeated the Danes at Klogoe, and was given command of an army sent to Spain against the French, 1808; triumphantly entered Madrid, 1812; defeated Jourdan and Soult, 1813; invaded France and gained numerous victories; defeated Napoleon at Waterloo, 1815; was afterward prime minister and minister of foreign affairs.

Wenceslaus, or Wenzel, 1361-1419. Emperor of Germany and king of Bohemia.

Werner, Abraham Gottlob, 1749-1817. An eminent German scientist and author.

Wesley, John, 1703-1791. A distinguished English divine and founder of the sect known as Wesleyans or Methodists. **Charles Wesley**, 1707-1788. Brother of the above; also a clergyman and poet; was associated with John in his religious labors.

West, Benjamin, 1738-1820. An American painter; born in Springfield, Pa., of Quaker parents. He went to Rome, Italy, in 1760, and proceeded to England in 1768, where he made his permanent residence. His "Death of General Wolfe" was among the first of his productions that attracted public notice. He died in London.

Westmacott, Sir Richard, 1775-1856. Sculptor; born in London; studied at Rome under Canova; he executed statues of Pitt, Addison, and others, and a number of monuments in Westminster Abbey and St. Paul's; his latest work was the sculptured pediment of the British Museum.

Wharton, Francis, 1820-1889. An American jurist; born in Philadelphia, Pa.; held the chair of international law in the Boston Law School. In 1855 he was appointed solicitor for the State Department. Under a resolution of Congress, 1888, he was made editor of the Revolutionary diplomatic correspondence of the United States. He wrote extensively on legal and theological subjects. Died in Washington, D. C.

Wheatstone, Charles, 1802-1875. A distinguished English scientist. He was the inventor of several important electrical appliances, and introduced the electric telegraph into England.

Whistler, James Abbott McNeill, 1834-1903. An American painter; born in Lowell, Mass.; studied for a time at the United States Military Academy; went to Paris, and afterward settled in London. The finest of his oil pictures are "The Artist's Mother—an Arrangement in Black and Gray," the "Portrait of Thomas Carlyle," and the "Portrait of Miss Alexander—Harmony in Gray and Green." Whistler's art is original and individual.

Whitefield, George, 1714-1770. Founder of Calvinistic Methodism; born at Gloucester, England; died at Newburyport, Mass.

Whitney, Eli, 1765-1825. A distinguished American inventor; born in Massachusetts; died in Connecticut. He invented the cotton gin and important improvements in firearms.

Whitney, William Dwight, 1827-1894. American philologist; born in Massachusetts; studied at Yale College, where he became professor of Sanskrit, in which he was a proficient, and to the study of which he largely contributed; has done much for the science of language.

Wierds (weerts), Antoine, 1806-1865. A Belgian painter; born at Dinant; did a great variety of pictures on a variety of subjects, some of them on a large scale, and all in evidence of a high ideal of his profession, and an original genius for art.

Wilberforce, William, 1759-1833. English philanthropist and statesman; secured the abolition of the slave trade.

Wilder, Burt Green, 1841- An American educator; born in Boston, Mass.; served in the Union army as medical cadet, assistant surgeon, and surgeon of the 55th Massachusetts Infantry, 1863-1865; he became professor of Neurology, Vertebrate Zoology, and Physiology at Cornell University in 1867.

Willard, Frances Elizabeth, 1839-1898. An American temperance reformer; born in Churchville, near Rochester, N. Y.; after some years spent in teaching she became professor of *Æsthetics* in the Northwestern University, and was made dean of the Woman's College in February, 1871; she began her active temperance work in 1874, and was made secretary of the National Woman's Christian Temperance Union; in 1879 she was made president of that organization and held the office till her death; she was chosen as president of the World's Christian Temperance Union in 1888, and in 1892 visited England as the guest of Lady Henry Somerset, the well known temperance worker; she was an orator of great eloquence, humor, and power; her executive ability and genius for organization were wonderful and her work for temperance and social purity will live in the history of her country; died in New York city.

William I. (the Conqueror), 1027-1067. King of England; duke of Normandy; conquered England.

William III. (William Henry of Nassau, Prince of Orange), 1650-1702. King of England; born in The Hague, Holland; his coronation as King of England took place in 1689; the year following William went to Ireland, where he defeated James at the battle of the Boyne; in 1691 he headed the confederate army in the Netherlands; took Namur in 1692, and in 1697 was acknowledged King of England by the treaty of Ryswick; on the death of Mary in 1694, the Parliament confirmed to him the royal title; his death was owing to a fall from his horse.

William I., 1797-1868. Emperor of Germany and king of Prussia. Born in Berlin. In 1849, as commander-in-chief of the Prussian army, he acted against the revolutionary Badeners; and in 1858, William was appointed regent. This position he occupied till Frederick William's death, in 1861, when he succeeded to the throne. In 1866, war was declared by Prussia against her old ally, Austria, and after a short campaign, Austria was compelled to make a humiliating peace. By this war Prussia obtained supremacy in Germany. In July, 1870, the Emperor Napoleon III., taking umbrage at Prussian interference with the succession to the vacant Spanish throne, or prompted by other motives, rashly declared war against Prussia, a power long prepared for such a contingency. On this, William, forming an alliance with the South German states, crossed the Rhine, and in a short campaign defeated the French, took Napoleon and his principal commanders prisoners, and received the capitulation of Paris in February, 1871. His success in the war with France led to an offer from the German states of the Imperial crown of Germany, which he accepted. He was crowned Emperor of Germany at Versailles, Jan. 18, 1871.

William II., 1859- German emperor and king of Prussia; ascended the throne June 15, 1888, upon the death of his father, Frederick III. of Prussia, and Frederick I. of Germany. Although of warlike tastes, his reign has been peaceful. He has maintained the German army at a high grade of efficiency, and has energetically promoted the construction of a powerful navy. He supports with vigor the imperial dignity, and causes any unfavorable reflection or innuendo regarding the ruling house to be punished with severity. He is a man of much learning and considerable ability, usually distant, but at times most gracious in his demeanor. His rule, on the whole, has been beneficial to Germany and to the world.

Williams, Roger, 1604-1683. English Puritan minister; founder of Rhode Island colony; born in Wales.

Wilmot, David, 1814-1868. An American statesman; author, 1846, of the "Wilmot Proviso," a bill declaring that slavery should not be permitted to exist in any territory acquired from Mexico. The bill passed the House, but failed in the Senate. He represented his state, Pennsylvania, in both houses of Congress.

Wilson, Henry, 1812-1875. An American statesman; born in New Hampshire. He represented Massachusetts in both Houses of the Federal Congress, and was elected vice-president on the ticket with General Grant, 1872.

Winchell, Alexander, 1824-1891. An American geologist; born in Dutchess county, New York. He lectured

extensively, and wrote a number of fascinating books on scientific subjects. He died in Ann Arbor, Mich., while a professor in the University of Michigan.

Winthrop, John, 1588-1649. First governor of Massachusetts; born in Edwardston, England. He came with the first colonists to Salem in 1630 as their governor, and remained in that office, with the exception of six or seven years, till his death. He left a journal of the proceedings of the colony, which has been published, and is a valuable contribution to the early history of Massachusetts. He died in Boston.

Wirt, William, 1772-1834. An American lawyer; born in Bladensburg, Md.; in 1806, settled in Richmond, Va., where he became a prominent lawyer; he distinguished himself at the trial of Aaron Burr in 1807, as one of the counsel for the prosecution; he was appointed United States attorney-general in 1817, holding the latter office till 1829, through three administrations; he was nominated for president in 1832 by the Anti-Masonic party and received the electoral vote of Vermont; he died in Washington, D. C.

Wittekind, -807. Leader of the Saxon struggle against Charlemagne; annihilated the Frankish army in 783; in retaliation Charlemagne executed 4,500 Saxons he had taken prisoners; this roused the entire Saxon people to arms, and led to a drawn battle at Detmold, upon which Wittekind accepted baptism, and was promoted to a dukedom by the Frankish king.

Wolf, Friedrich August, 1759-1824. Great classical scholar; born near Nordhausen; professor of Philology at Halle; became world famous for his theory of the Homeric poems.

Wolfe, James, 1727-1759. Major-general; born in Kent, England; Pitt appointed him to a command in Canada; here he distinguished himself first at the siege of Louisburg, and then by the capture of Quebec, where he fell at the moment of victory.

Wolff, Johann Christian von, 1679-1754. German philosopher and mathematician; born at Breslau; he was a disciple of Leibnitz, and the father of the philosophy that prevailed in Germany before the time of Kant; his merits as a philosopher were threefold; he claimed for philosophy the entire field of knowledge, he paid special attention to method in philosophical speculation, and he first taught philosophy to express itself in German, or made German the philosophical language.

Wollaston, William Hyde, 1766-1828. A distinguished English chemist and natural philosopher.

Wolsey, Thomas, Cardinal, 1471-1530. An English prelate; born in Ipswich, England. When Henry VIII. became king, Wolsey was successively appointed Canon of Windsor, Dean of York, Bishop of Lincoln, Archbishop of York, and his nomination as cardinal in 1515 and pope's legate in 1518 completed his ecclesiastical dignities. In 1515 he was also appointed lord-chancellor of the kingdom. Part of his immense revenues he expended in display, and part more laudably for the advancement of learning. Wolsey lost the royal favor when he failed to obtain from Pope Clement a decision granting the king's divorce from Catherine of Aragon. He was banished from court, stripped of his dignities, and sentenced to imprisonment. Finally he was arrested at Cawood Castle on a charge of high treason, and on his way to London as a prisoner died in Leicester Abbey.

Worcester, Edward Somerset, Marquis of, 1601-1667. One of the earliest inventors of a steam engine. He was engaged in the service of Charles I. during the civil war, and was imprisoned in the Tower from 1652-1654. He afterward spent his time in retirement, and in 1653 published a book entitled "Scantlings of One Hundred Inventions," in which he first gave a description of the uses and effects of his steam engine.

Worcester, Joseph Emerson, 1784-1855. An eminent American lexicographer; author of the popular Dictionary bearing his name; born in New Hampshire.

Wrangel, Frederick, 1784-1877. Prussian field-marshal; born at Stettin; served with distinction in various campaigns, and commanded in the Danish War of 1864, and was present in the Austro-Prussian War of 1866, though without command.

Wren, Sir Christopher, 1632-1723. The greatest of English architects; born in East Knoyle, Wiltshire, England. He had been appointed by Charles II. to restore old St. Paul's, but after the great fire in 1666 it became necessary to rebuild the cathedral. It was begun in 1675, and the architect saw the last stone laid by his son thirty-five years afterward. Among the other notable buildings which Wren designed are: the modern part of the palace at Hampton Court, the library of Trinity

College, Cambridge, the hospitals of Chelsea and Greenwich, the churches of St. Stephen's, Walbrook; St. Mary-le-bow, Cheapside; St. Michael, Cornhill; St. Bride, Fleet street; as also the campanile of Christ Church, Oxford, and Marlborough House, Pall Mall. From 1685 to 1700 represented various boroughs in Parliament. He died in Hampton Court.

Wu Ting-Fang, 1842-. A Chinese diplomatist; born in Singapore; studied Chinese literature and classics together with English in Canton, and took a law course in England, 1874-1877. On his return to China he directed the construction of the first railroad in his native land; was the first secretary of the Chinese commission to negotiate with Japan in 1895, and was afterward a plenipotentiary to ratify the treaty. He was appointed envoy extraordinary and minister plenipotentiary to the United States in 1896. While residing in Washington he became very popular. In 1900 the degree of LL.D. was conferred on him by the University of Pennsylvania. He ranks among the progressive statesmen of China.

Wycliffe or Wickliffe, John, 1324-1384. An English reformer; founder of the Lollards, and translator of the Scriptures into English.

Xantippe. The wife of Socrates; notorious for bad temper, but credited by her husband with many domestic virtues.

Xavier (sav'er), Francis, Saint, 1506-1552. Spanish Jesuit missionary to India and Japan. He was canonized in 1622.

Xenoph'anea. Flourished sixth century B.C. A Greek writer and philosopher; born in Colophon. Exiled from his Ionian home, he established himself at Elea in Southern Italy.

Xerxes I. (zark'see). King of Persia from 485 to 464 B.C. Famous for his unsuccessful invasion of Greece, his fleet having been defeated at Salamis (September, 480); and his army under Mardonius at Plataea, and the remnant of his fleet at Mycale, both on the same day (479).

Ximenes (he-may'neth) de Cisneros, Francisco, 1466-1517. Spanish cardinal and statesman; born in Castile; in 1495 became archbishop of Toledo, but not till he was sixty years of age; in ten years after this he became regent of Spain, and conducted the affairs of the kingdom with consummate ability.

Yale, Elihu, 1648-1721. An Anglo-American philanthropist; born in Boston, Mass. He went to England while very young, and was there educated, never returning to America. About 1672 he went to the East Indies as a trader, and acquired great wealth. From 1687 to 1692 he was governor at Fort St. George, Madras. He gave to the Saybrook Collegiate School books and money valued at \$4,000, a gift which resulted in the connection of his name with the college after its removal to New Haven. He died in London, and was buried at Wrexham, a town in North Wales.

Young, Brigham, 1801-1877. An American Mormon; born in Whitingham, Vt. He died in Salt Lake City.

Zaleu'eus. Flourished seventh century, B.C. Greek legislator and reformer; first to make a written code of laws.

Zamojski, John Sarius, 1541-1606. Polish general, statesman, and scholar.

Zedeki'ah. Flourished sixth century, B.C. The last king of Judah; placed on the throne 598 B.C., by Nebuchadnezzar, Jehoiachin, his nephew and predecessor, being carried captive to Babylon; Zedekiah, having rebelled, was taken prisoner to Babylon, 586, B.C., and put to death.

Ze'no. Flourished 500 B.C. Greek philosopher of the Eleatic school; was the founder of the dialectic so successfully adopted by Socrates, which argues for a particular truth by demonstration of the absurdity that would follow from its denial, a process of argument known as the *reductio ad absurdum*.

Zeno. Flourished third century, B.C. Greek philosopher; the founder of Stoic philosophy; born at Citium, in Cyprus; went to Athens, and after posing as a cynic at length opened a school of his own in the Stoa, where he taught to extreme old age.

Zeno'bia. Flourished third century, A.D. A Queen of Palmyra, who succeeded to the throne as regent for her sons on the murder of her husband Odenathus, 266 A.D. According to Zosimus she died on her way to Rome.

Zin'zendorf, Nikolaus Ludw'g von, Count, 1700-1760. A German count; born in Dresden; established the religious community of Herrnhut on his estate in Sax-

ony, consisting chiefly of a body of Moravian brethren, who had been driven out of Bohemia and Moravia on account of their religious opinions, and were called Herrnhuters, of which he became one of the leaders and chief apostles.

Ziska, John, 1360-1424. A distinguished Hussite leader, who won distinction in war against the Teutonic knights, Turks, French, and Imperialists, defeating the latter in thirteen pitched battles.

Zoroaster (z'ro-as-ter), Zarathush'tra, or Zerdusht. The founder or reformer of the Parsee religion; though certainly a historical personage, nothing whatever is known except that his family name was Spitama, that he was born in Bactria, and that he could not have flourished later than 580 B.C.

Zurbaran (thur-bar'an), Francesco, 1508-1662. A distinguished Spanish painter.

Zwing'le, Ulrich (Zuinglius), 1484-1531. A distinguished Swiss reformer; killed at the battle of Cappel.

DERIVATIONS AND FICTITIOUS NAMES OF STATES AND TERRITORIES.

ALABAMA (Ala.).—The name is of Indian origin, signifying "Here we rest."

ARIZONA (Ariz.).—An Indian word, meaning "Sand hills."

ARKANSAS (ARK.).—French and Indian words, signifying "Bow of Smoky Waters." The fictitious name of the state is "Bear State," from the number of these animals formerly found there.

CALIFORNIA (Cal.).—From Spanish words, meaning "Hot furnace." The fictitious name is "The Golden State."

COLORADO (Colo.).—Spanish word, meaning "Colored."

CONNECTICUT (Conn.).—An Indian name, signifying "The long river." The nicknames are "Freestone State," "Nutmeg State," and "Land of Steady Habits."

DAKOTA (Dak.).—Indian word meaning "allied."

DELAWARE (Del.).—Named in honor of Lord De La War. It is called "The Diamond State," from its small size and its intrinsic worth; also "Blue Hen State."

FLORIDA (Fla.).—From the Spanish, meaning "flowery"; so called from the abundance of flowers, and the day (Easter Sunday) upon which it was discovered. From its shape it is sometimes called "The Peninsular State."

GEORGIA (Ga.).—Named in honor of King George II. of England. The nickname is the "Empire State of the South."

ILLINOIS (Ill.).—An Indian word, signifying "Tribe of men." The sobriquet is "Prairie State"; also "Sucker State."

INDIANA (Ind.).—So called from the Indians. The original meaning of the word India is "country of the river." The nickname is "The Hoosier State."

IOWA (Ia.).—An Indian word meaning "The Sleepy Ones." The fictitious name is "The Hawkeye State."

KANSAS (Kan.).—Indian word, signifying "Smoky Water." The sobriquets are "Garden of the West" and "Jayhawker State."

KENTUCKY (Ky.).—Indian name signifying "The Dark and Bloody Ground." The nickname is "The Corn-Cracker State."

LOUISIANA (La.).—Named in honor of King Louis XIV. of France. "The Creole State."

MAINE (Me.).—So called from Maine in France. "The Pine Tree State."

MARYLAND (Md.).—Named in honor of Queen Henrietta Maria of England.

MASSACHUSETTS (Mass.).—An Indian name, signifying "Blue Hills." The fanciful name is "The Bay State."

MICHIGAN (Mich.).—Indian word, meaning "The Lake Country." It is nicknamed "The Lake State"; also "The Wolverine State."

MINNESOTA (Minn.).—From Indian words meaning "Cloudy Water." It is called "The Gopher State."

MISSISSIPPI (Miss.).—Indian word for "Father of Waters." It is nicknamed "The Bayou State."

MISSOURI (Mo.).—Indian word, meaning "Muddy Water."

MONTANA (Mont.).—From the Spanish, meaning "Mountain Land."

NEBRASKA (Neb.).—An Indian word, meaning "Shallow River."

NEVADA (Nev.).—Spanish word, signifying "Snow-clad." The fictitious name is "The Sage Hen State."

NEW HAMPSHIRE (N. H.).—Named from Hampshire county, Eng. The sobriquet is "The Granite State."

NEW JERSEY (N. J.).—Named for the Isle of Jersey. The sobriquet is "The Jersey Blue."

NEW MEXICO (N. M.).—Spanish. Named from the country of Mexico, meaning "The Place of Aztec, God of War."

NEW YORK (N. Y.).—Named in honor of the Duke of York and Albany. It is called "The Excelsior State" and "The Empire State."

NORTH CAROLINA (N. C.).—Named, with South Carolina, in honor of Charles II. of England. "The Old North State," "The Tar State," and "The Turpentine State."

OKLAHOMA (Okla.).—Signifies in Cherokee "Home of the Red Man."

OREGON (Ore.).—Signifies "River of the West."

PENNSYLVANIA (Pa.).—"Penn's Woodland" is the signification. The sobriquet is "The Keystone State."

RHODE ISLAND (R. I.).—Named from the Isle of Rhodes, in the Mediterranean. Rhodes signifies a "rose." It is nicknamed "Little Rhody."

SOUTH CAROLINA (S. C.).—Named in the same manner as North Carolina, which see. The sobriquet is "The Palmetto State."

TENNESSEE (Tenn.).—Derived from Indian words signifying "River of the Big Bend." It is nicknamed "The Big Bend State."

TEXAS (Tex.).—Spanish; said to signify "Friends." It is nicknamed "The Lone Star State."

UTAH.—Named from the Utes, or Utah Indians.

VERMONT (Vt.).—From the French, signifying "Green Mountain." It is called the "Green Mountain State."

VIRGINIA (Va.).—Named for Elizabeth, Queen of England—the "Virgin Queen." It is nicknamed "The Mother of States," also "The Old Dominion."

WASHINGTON (W.).—Named for President Washington.

WEST VIRGINIA (W. Va.).—It is nicknamed the "Panhandle State."

WISCONSIN (Wis.).—Named from its principal river, and that from the French, meaning "flowing westward." The fictitious name is "The Badger State."

WYOMING (Wyo.).—An Indian term, meaning "large plains."

SPANISH AMERICAN WAR.

By 1898 the bloodshed and starvation in Cuba caused by the cruel measures of the Spanish Government for the suppression of the rebellion there, and the damage thus inflicted upon American commerce, and upon American interests in Cuba, had rendered the Cuban situation intolerable to the United States. At the opening of that year the United States Government began to concentrate its naval forces and accumulate war supplies, and public opinion had begun to favor war with Spain, if it should be necessary for ending the war in Cuba. On Feb. 15, the battleship *Maine*, which had been sent to the island for the protection of American interests, was blown up in Havana harbor by a floating mine and 266 of her crew were killed. Though the commission appointed by the government to investigate the disaster declined to fix responsibility for it, public opinion attributed it to the Spanish officials and Congress at once voted \$50,000,000 for national defense. On March 28, President McKinley tendered Spain his good offices in securing a cessation of hostilities and proposed the relief of the suffering Cubans by aid from

the United States. The Spanish government replied with counter proposals which were not satisfactory to the American government and on April 11 the president in his message to Congress asked to be empowered to use the army and navy to secure the formation of a capable Cuban government. Congress passed a joint resolution declaring the Cubans independent and demanding that Spain surrender all authority in the island and directing the president to use the army and navy to enforce the resolution. This ultimatum was sent to the Spanish Government on April 20. It received no reply, whereupon diplomatic relations between the two nations were severed and war was declared by Spain on April 24 and by United States on April 25.

On that day Commodore Dewey's fleet, consisting of the protected cruisers *Olympia*, *Baltimore*, *Raleigh*, *Boston*, the gunboats *Concord* and *Petrel*, and the revenue cutter *McCulloch* (all, 131 guns, 1080 men), left Hong Kong for Manila Bay and there on May 1, Dewey completely destroyed the Spanish fleet (of 120 guns, 1796 men) under Montojo. The American loss was 6 men wounded; that of the Spanish, 635 killed and wounded.

Meanwhile a fleet of 4 cruisers and 3 torpedo boat destroyers under Admiral Cervera sailed from St. Vincent and on May 29 these ships were discovered at anchor in the harbor of Santiago, Cuba, by Commodore Schley. Here they were promptly blockaded.

On June 15, General Shafter with 16,000 men sailed from Tampa for Cuba with orders to capture the garrison of Santiago and to assist in capturing the harbor and fleet. He effected a landing on June 22, and after sharp engagements at Las Guasimas and El Caney, he invested Santiago on July 1. On the morning of July 3, Cervera sought to escape from the harbor. After a running fight of less than two hours the Spanish ships were destroyed with a loss of about 350 men killed and 1700 captured, among whom was Cervera. The American loss was 1 man killed and 10 wounded. On July 15, General Toral surrendered the city and district of Santiago with forces aggregating 23,500 men. The Spanish loss was about 1,000 men, the American, 1,614. The last days of July, General Miles occupied Porto Rico and, on Aug. 7, General Merritt and Admiral Dewey captured Manila with about 11,000 Spanish troops.

Through the French ambassador at Washington, the Spanish Government had made overtures for peace on July 28. A peace protocol was signed Aug. 12, which provided that a peace commission should meet in Paris not later than Oct. 1. There a treaty was signed

on Dec. 10. By its terms, Spain ceded Porto Rico and her other West Indian possessions, Guam, and the Philippines to the United States in return for \$20,000,000 paid by United States. The political status of the inhabitants of the new possessions was to be determined by the United States.

There were 2,995 American soldiers and sailors killed in the war, 2,660 by disease. The cost in money was practically \$165,000,000.

RUSO-JAPANESE WAR.

The indirect cause of the Russo-Japanese war was the fundamentally opposing interests of the combatants in northeast China and Korea. But the *direct* causes arose out of the acquirement and historical development by Russia and Japan of those conflicting interests. Thus for clear comprehension of the war's causes and its results we must understand: (1) What the interests of Japan and Russia in Manchuria and Korea have been; (2) What acts and policies brought these hostile interests more and more into conflict until war resulted.

(1) The interests of Japan in Manchuria have been chiefly commercial. If under Chinese control, that region will ultimately furnish a most important market for Japanese manufactures. In Korea, Japan has both a social and a commercial interest,—each of which she considers vital to her own development and national welfare. She is thus deeply concerned socially because at home she has been facing the crisis of over-population. To produce for her forty-four millions, her total area of 160,000 square miles affords less than 20,000 square miles of tillage lands, and her population is increasing by 400,000 annually. For meeting this crisis, the Japanese people have two resources. They have begun to relieve their overtaxed islands by seeking support in the fertile and sparsely populated Korea, where, in 1902, 16,000 Japanese citizens were residing. The islanders' second resort for their adequate support is to transform themselves from an agricultural into a manufacturing and commercial nation. But such a country must have extensive markets; and with Korea undeveloped and so near their own shores Japanese merchants and capitalists have first sought to exploit that field. Such has been their success that, at the opening of the hostilities, Korean railways and banking houses were chiefly under Japanese control; of vessels entering Korean ports more than 70 per cent. were Japanese; and three-fourths of the Hermit Kingdom's foreign trade was carried on with Japan. These vast social and commercial interests in Korea had begun to spell Japanese political control.

Russian aims and interests in Manchuria had been primarily political and secondarily commercial. From 1900 to 1904 she was building forts, towns, railroads in that country. There is no doubt that the governing body of Russia aimed at the complete Russification of Manchuria and its gradual absorption into the Russian Empire. In order to further this policy, Russia had begun to establish at Manchurian ports duties for the benefit of commerce and industries exclusively Russian—tariffs which would ultimately have ruined Japanese commerce there. Besides this, the Trans-Siberian railroad was giving her a pre-dominance in the trade of all north China. On the commerce of Korea, however, Russia's grasp has always been feeble and in 1902 she had less than one hundred subjects in that country. Nevertheless, the needs of the Russian imperial policy demanded that Russia herself should acquire in Korea interests which should supplant those of Japan already established there. Why, we shall immediately see.

(2) Since the advent of Russia as a great power she has perennially sought an adequate outlet for her commerce to the ocean—an ice-free seaport. Repeatedly thwarted in this aim in Europe, the last half of the nineteenth century saw her complete a marvelous five thousand miles' march across northern Asia to the Pacific; and to firmly fix her hold on the territories she had thus acquired and, in order to possess in the railroad itself a powerful leverage for obtaining on the Pacific the long-sought open port, she began to construct the Trans-Siberian Railway from St. Petersburg to Vladivostok. Before its completion, Japan won the war of 1895 against China, whose government as part of the price of peace ceded to the victor the Liao Tung peninsula. This strip of seacoast included the only adequate harbors of Manchuria,—Port Arthur and Talienwan,—and to possess it had been the cardinal object of Russia's policy. Without its two ports, she saw that her ocean trade must be confined to the winter-bound Vladivostok and that the chief aim of her Trans-Asian march would be defeated. This explains why, within one week after the peace was signed, Russia, Germany, and France, at Russian instance, demanded in a joint note sent to Japan, that she restore the ceded territory to China. The demand contained the veiled threat of its enforcement by arms and Japan could but obey it, although no doubt her statesmen saw the secret purpose of the Russian government. The Japanese began to treble their army and double their navy as a policy of defense; and when three years later under a "lease" from China, Russia herself took control of Port

Arthur and began to fortify it with the object of permanent possession, the growing distrust of Russia among the people of Japan became a settled national enmity.

With Japan hostile, it became the policy of Russia to secure the intercommunication of her Eastern ports and their free access to the Pacific against a possible war with her rival. In order to accomplish this task, the Russians saw that they must do nothing less than *acquire and fortify southern Korea*. A glance at a map showing the position of the Japanese islands with reference to the mainland will reveal the fact that Russian merchant steamers or war vessels, in order to communicate with Port Arthur and Dainy had to pass out of the sea of Japan through water ways between the Japanese islands or adjacent to them. These straits are few and so narrow that, in case of war, the Japanese navy can, by means of sunken mines, effectually close them against all vessels. Those islands of Japan situated in the Korean straits, being splendid naval bases, afford to the Japanese not only the same opportunity for sealing that entire passage, but also great advantage to their fleet operating to prevent that passageway's navigation. The increasing control of Korea's southern ports by the Japanese was increasing their ability to control the Korean straits. And the Russians saw that their access to the Pacific from the Vladivostok region and the intercourse between Vladivostok and Port Arthur would depend entirely upon Japan's good will,—unless Russia could herself acquire the point of the Korean peninsula and make of its ports garrisons and naval bases which would protect Russian commerce and communications.

Of equal importance with this strong motive to Korean aggression, two other incentives urged the Russians to acquire the Korean ports. It was their imperial policy to absorb Manchuria, to which end their fleet in Eastern waters was to be enormously increased. In that case Port Arthur and Vladivostok would ultimately have proven inadequate as naval bases, and only the Korean ports could have supplied the deficiency. Furthermore, Port Arthur and Dainy had not proven satisfactory as ice-free ports. The acquisition of the Korean ports from one to two hundred miles farther south would have fully gratified the Russian governing body's ambition. To secure these objects, Russia began the aggression in northern Korea which was the immediate cause of the war.

The objections of Japan to Russian occupation of Korea are self-evident. It would have annulled Korean independence, which Japan won from China by the war of 1894-95. It would have insured to Russia the ownership of Manchuria and the consequent destruction of Japanese commerce there. In Korea, it would have ruined social and commercial interests vital to the Japanese national welfare. It would have installed, within easy striking distance of Japan's shores and in an enormous strategic advantage, a power of immense strength and boundless ambition.

In the summer of 1903, active Russian aggression in northern Korea led the Japanese government, on Aug. 12, to send a note to St. Petersburg, the purpose of which was to reach a settlement between the two nations of the status of each in Korea and Manchuria. This note requested Russia to sign an agreement with Japan to respect the integrity of the Chinese Empire in Manchuria and of the Korean Empire and to uphold in both the principle of open door to the trade of all nations. Throughout the negotiations which followed, Russia refused to discuss her intentions in Manchuria. She declined to agree that her protectorate would not be extended to Korea, and while refusing to state her own purposes there, she sought to settle what those of Japan should be. After six months of fruitless negotiations, during which war preparations were hurried forward in both countries, it became evident that no agreement could be reached, and on Feb. 6, 1904, the two governments severed their diplomatic relations by recalling their ministers at St. Petersburg and Tokio. The first hostile act occurred the following day, when a strong Russian force invaded the disputed territory in Korea. War was declared by Russia, Feb. 10; and by Japan, Feb. 11.

The chief events of the war are as follows:—

Feb. 8. The United States, through Secretary Hay, invited the principal powers of the world to suggest to Russia and Japan that hostilities should be localised and restricted to as small an area as possible, that the neutrality and administrative entity of China should be respected, and in order that China might be free from disturbances and that foreign interests there should not be menaced. This invitation was accepted and the objects mentioned were attained.

Feb. 8. Admiral Togo's (J) naval attack on Admiral Stark's squadron at Port Arthur. The *Czarevitch* and *Retzan* battleships (R) and the *Pallada*, protected cruiser (R), disabled by torpedoes.

Feb. 9. Admiral Uriu's (J) naval attack on the *Varyag* and *Koriets* at Chemulpo, Korea. Both were destroyed.

May 1. Battle of the Yalu. Kuroki (J) defeats Zassulitch and enters Manchuria from Korea.

May 6. Battle of Nan Shan Hill. Oku (J) captures that hill, the key to the outer defenses of Port Arthur.

May 18. The battleship *Petropavlovsk* (R) taking part in a sortie from Port Arthur strikes a mine and sinks, carrying down 600 men including Admiral Makaroff.

June 15. Battle of Telissu. Oku (J) defeats Stachelberg, thus frustrating Kuropatkin's attempt to relieve Port Arthur.

Aug. 10. The Russian Port Arthur fleet, attempting a junction with the Vladivostok squadron, is defeated and Admiral Witthoef (R) is killed. The cruiser *Askold* (R) and the battleship *Czarevitch* (R) are compelled to enter neutral ports and dismantle, and the cruiser *Novik* (R) flees to Saghalien, where she is destroyed.

Aug. 14. Admiral Kamimura (J) defeats the Vladivostok squadron, sinking the cruiser *Rurik*, and disabling the cruisers *Rosalia* and *Gromoboi*.

Aug. 26—Sept. 8. Battle of Liao Yang. Oyama (J) with 215,000 men defeats Kuropatkin with 200,000 men. The Russians retreat towards Mukden.

Oct. 4—20. Battle of Shaho River. Oyama (J) with 800,000 men defeats Kuropatkin with the same number, and the Russian offensive movement is repulsed.

Nov. 80. Nogi (J) captures 203 Meter Hill, overlooking Port Arthur. From this point the remainder of the Port Arthur fleet is destroyed.

Jan. 1, 1905. Port Arthur and about 80,000 Russians under Stoessel are surrendered to Nogi.

Jan. 25—30. In the Battle of the Hun River, Kuropatkin's attempt to break through the Japanese lines is defeated.

Feb. 20—March 15. The Battle of Mukden. In a series of engagements constituting the greatest battle of modern times, the Russians are decisively defeated and retreat to Harbin. They lose 107,000 men; the Japanese, 57,000. Kuropatkin is superseded by Linevitch.

May 27—28. Battle of the Sea of Japan. Togo (J) annihilates the Baltic squadron under Rozhdestvensky. The Russians lose 8 battleships, 3 armored cruisers, 2 protected cruisers, 3 coast defense vessels, and 14,000 killed and 3,000 prisoners, out of a total of 18,000 men. Japan lost 3 torpedo boats and about 800 men.

June 7. Formal appeal of President Roosevelt for peace addressed to Russia and Japan.

July 30. A Japanese expedition from Yokohama captures the southern half of Saghalien.

Aug. 29. Peace plenipotentiaries reach a final agreement at Portsmouth, N. H.

Sept. 6. Treaty of Portsmouth signed. (Ratified Oct. 14.)

President Roosevelt had urged the belligerents to make peace after the battles of Liao Yang, Shaho River, and Mukden. After the Russian naval defeat on the Sea of Japan he was successful. The peace plenipotentiaries were M. Witte and Baron Rosen for Russia, and Baron Komura and M. Takahira representing Japan.

The terms of the Treaty of Portsmouth are as follows:—

Art. I. re-establishes peace.

Art. II. Russia recognizes the paramount political, economic, and military interests of Japan in Korea and agrees not to interfere with any measures

for guidance, protection, and control which the Japanese Government may take there.

Art. III. Both nations agree to evacuate Manchuria, with the exception of the Liao Tung peninsula. They agree to restore to the exclusive administration of China all portions of China with the exception above mentioned. The Russian Government declares it has no exclusive advantages or concessions there.

Art. IV. Japan and Russia engage not to obstruct Chinese measures for the development of Manchuria.

Art. V. Russia transfers the lease of Port Arthur and surrounding territory to Japan.

Art. VI. Russia cedes to Japan the railroad between Chang Chung Fu and Kuan Chang Tsu and Port Arthur, and all the branches.

Art. VII. Russia and Japan agree that their railroads in Manchuria shall be exploited only for industrial and commercial purposes and in no wise for strategic purposes.

Art. VIII. The two governments agree to conclude an agreement to regulate their connecting lines in Manchuria.

Art. IX. Russia cedes to Japan the southern portion of Saghalien up to the 50th parallel. The two powers agree to leave the island unfortified.

Art. X. Russian inhabitants of Saghalien may sell their property and retire to their country. But those who prefer to remain will be protected in full exercise of their industries and rights of property, on condition of submitting to the Japanese laws.

Art. XI. Russia engages to grant fishing rights to Japanese subjects along the coasts of her possessions in the Japan, Bering, and Okhotsk seas.

Art. XII. The two nations agree to adopt as a basis for their commercial relations, pending the conclusion of a new treaty of commerce, the basis of the treaty in force previous to the war.

Art. XIII. Russia and Japan mutually engage to restore their prisoners of war with statements of the direct expenditures incurred for their care. Russia agrees to pay Japan the difference between the actual amount so expended by Japan and the actual amount similarly disbursed by Russia.

Sub-Article to Article III. The two governments mutually engage to commence the withdrawal of their troops from Manchuria immediately after the treaty comes into operation, and to complete the same in 18 months. They reserve the right to retain guards for their railroads not to exceed 15 per kilometer.

Sub-Article to Article IX. The boundary between Russian and Japanese territory in Saghalien to be fixed by a special commission consisting of an equal number of members to be appointed respectively by each government.

LOSSES.

| Naval.* | Russia. | Japan. |
|-------------------------|-----------------|---------------|
| Battleships, | 15† | 2 |
| Armored Cruisers, | 5 | 0 |
| Protected Cruisers, | 11‡ | 4 |
| Coast Defense Ironclads | 3 | 0 |
| Destroyers, | 32 | 2 |
| Men, killed and wounded | 375,000 | 250,000 |
| Property values, | \$1,050,000,000 | \$500,000,000 |

* Does not include converted cruisers, torpedo boats, and supply ships. The Russian naval loss amounted to \$112,000,000; that of Japan to \$20,000,000, but the value of the Russian ships captured and raised by Japan amounts to \$50,000,000.

† One battleship, the *Czarevitch*, interned in a neutral harbor. By the terms of peace it belongs to Russia.

‡ Five interned and belong to Russia.

The general results of the war constitute Japan the first nation of the East and one among the great powers of the world. The evacuation of Manchuria and the rise of Japan have put an end to the attempts of European powers to divide China among themselves, and that Empire and the other oriental countries have opportunity to develop along their own natural lines. The triumph of Japan probably means the downfall of exclusiveness in Asiatic markets and the triumph of the principle of the open door. Japan assumed political control of Korea on Nov. 18, 1905.

DECISIVE BATTLES OF HISTORY.

MARATHON, B. C. 490. The Athenians under Miltiades defeated the Persians under Datis. Free government and Greek civilization preserved.

SYRACUSE, B. C. 414. The Athenians defeated by the Syracusans and their allies, the Spartans, under Gylippus.

ARBELA, B. C. 331. The Persians defeated by the Macedonians and Greeks under Alexander the Great. End of the Persian empire. Greek influence extended from the Nile to the Caspian.

METAAURUS, B. C. 207. The Carthaginians under Hasdrubal were defeated by the Romans under Caius and Marcus Livius and it was decided that the civilization of the world was to be Roman rather than Carthaginian.

WINFELD-LIPPE, A. D. 9. Teutonic independence established by the defeat of the Roman legions under Varus at the hands of the Germans under Arminius (Hermann). The line drawn between the Germanic and Latin races.

CHALONS, A. D. 451. The Huns under Attila, called the "Scourge of God," defeated by the confederate armies of Romans and Visigoths.

TOURS, A. D. 732. The Saracens defeated by Charles Martel and Christendom rescued from Islam.

HASTINGS, A. D. 1066. Harold, commanding the English army, defeated by William the Conqueror, and a new régime established in England by the Normans. The mixture of the Saxon and Norman races made a new, vigorous people.

SIEGE OF ORLEANS, A. D. 1429. The English defeated by the French under Joan of Arc. France saved from the fate of Ireland.

DEFEAT OF THE SPANISH ARMADA, A. D. 1588. England saved from Spanish invasion.

BLLENHEIM, A. D. 1704. The French and Bavarians under Marshal Tallard defeated by the English and their allies under Marlborough. Germany delivered from Louis XIV.

PULTOWA, A. D. 1709. Charles XII. of Sweden defeated by the Russians under Peter the Great. Russia becomes a great power.

SARATOGA, A. D. 1777. Critical battle of the American War of Independence. The English defeated by the Americans under General Gates.

VALMY, A. D. 1792. An invading army of Prussians, Austrians, and Hessians, under the Duke of Brunswick, defeated by the French under Kellermann. The first success of the Republic against foreigners.

TRAFALGAR. On the 21st of October, A. D. 1805, the great naval battle of Trafalgar was fought. The English defeated the French and destroyed Napoleon's hopes to successfully invade England. Checked the attempt to found an empire for one man.

WATERLOO, A. D. 1815. The French under Napoleon defeated by the allied armies of Russia, Austria, Prussia, and England under Wellington.

GETTYSBURG, July, A. D. 1863. The deciding battle of the war for the Union. The Confederates under General Lee defeated by the Union forces under Meade.

SEDAN, A. D. 1870. The decisive battle of the Franco-German war. Rise of the German empire.

MANILA BAY, May, A. D. 1898. United States enters world politics.

MUKDEN, March, A. D. 1905. Russians defeated by the Japanese. The check on European conquest of Asia.

RECENT DESPERATE WARS.

Indian Mutiny. General disaffection from a variety of real or supposed grievances had been for a long time smoldering amongst the Sepoys, who were the flower of the British East India Company's forces, but when a report spread that cartridges smeared with cow and pork fat were to be used by the native soldiers, open mutiny, attended with great cruelty, broke out.

The war, which may be said to have commenced in March, 1857, raged until June, 1858. It was marked by a succession of romantic, pathetic, and heroic incidents—the siege of Delhi, the massacre of Cawnpore, the relief and capture of Lucknow—but was suppressed in the latter year, when the East India Company, after a life of more than two and a half centuries, ceased to exist, and the government of India was assumed by the British crown. A cruel vengeance was taken on the mutineers, hundreds of whom were strung together and blown to pieces at the mouths of cannon.

The Abyssinian War arose out of the imprisonment of Consul Capt. C. Cameron, Rev. H. Stern, a missionary, and others by King Theodore, in consequence of a supposed slight by the British government, 1864. Mr. Rassam was sent on a mission to Abyssinia for their release. On the refusal of the king to surrender the prisoners, an English army, some 12,000 strong, under Sir Robert (afterwards Lord) Napier, defeated the Abyssinian forces at Arogee, April 10, 1868, and three days later stormed the fortress of Magdala. In consequence of this King Theodore com-

mitted suicide. The prisoners were released, and the war terminated.

American Civil War. This began April 13, 1861, with the capture of Fort Sumter, Charleston, by the Confederate forces. The North prepared for the contest with energy, and blockaded the Southern ports. Throughout the war the Confederates chiefly acted upon the defensive, the Federals or Northern forces, being the attacking party, and possessing the advantage of superior forces, money, and war material. The principal generals of the South were Lee, "Stonewall" Jackson, Hood, Albert Sidney Johnston, Longstreet, Bragg, Beauregard, Stuart, Joseph E. Johnston; and of the North, Grant, Sherman, Sheridan, McClellan, Thomas, Rosecrans, Pope, Butler, Halleck, Baker, Burnside, Frémont, Meade, Banks, and McDowell. In the campaign of 1861 the advantage was chiefly on the side of the Confederates, who were victorious at Bull Run (Manassas, Va.) and Ball's Bluff, Va. (October 21), but suffered a reverse at Springfield, Mo. (Aug. 10), and lost Fort Hatteras, N. C., captured by Butler (August 29). During 1862 the Confederates were successful at Bull Run (August 20) and in Virginia (June) at Fredericksburg, Va. (Dec. 10-15), but sustained severe defeats at Mill Springs, Ky. (January 19), Pea Ridge, Ark. (March 6-8), Winchester, Va. (March 23), Williamsburgh, Va. Great battles were fought at Shiloh, Tenn. (April 7), Fair Oaks, Va. (May 31, June 1), on the Chickahominy (June 25-July 1) and Antietam Creek, Md. (September 17), in none of which either party could claim a victory; but the battle of Antietam Creek obliged Lee to abandon his invasion of the North. During this year the naval operations of the Federals were generally successful, Admiral Farragut running past the forts of the Mississippi and seizing New Orleans (May). The memorable conflict between the "Merrimac" (Confederate) and the Federal "Monitor" resulted (March 9) in the repulse of the former, the "Merrimac" being burned by the Confederates on the capture of their arsenal at Norfolk, Va. (May 11). The war during 1863 was decidedly in favor of the Federal forces, although the Confederates, under "Stonewall" Jackson, defeated Hooker at Chancellorsville (May 2-4), Jackson subsequently dying from his wounds (May 10), and Lee invaded Maryland and Pennsylvania. At Gettysburg, Pa. (July 1-3), Lee was defeated, and retreated into Virginia, while at Chattanooga, Tenn. (Nov. 24, 25), the Confederates, under Bragg, sustained a severe repulse. Grant made a successful campaign in Tennessee, gaining several battles and capturing Vicksburg, Miss.,

which, after a gallant defense, surrendered (July 4). In August, the siege of Charleston began, and Fort Sumter was destroyed (August 21, 22), but the city was not taken until 1865 (February 18). With the appointment of Grant as commander-in-chief, in the early part of 1864 (March 3), and his vigorous reorganization of the army, the power of the North was greatly strengthened. Taking the command of the army of the Potomac, Grant opposed the Confederates under Lee, while Sherman operated against Joseph E. Johnston. In the Virginian campaign, after two days' severe fighting (May 3-6) at the Wilderness, the result was indecisive, and Grant's attempt to cut off Lee's army from Richmond was unsuccessful. At Atlanta, Ga., Sherman, in three battles (July 20, 22, 28), defeated the Confederates under Hood. In the Shenandoah valley the Federals were victorious in several engagements (August), and under Sheridan at Winchester (September 9), and Cedar Creek (October 19). In November General Sherman marched through Georgia to Savannah, which was entered December 21, while at Nashville, Tenn., the Confederates under Hood were defeated (December 14-16) by the Federals under Thomas. Among the incidents of this year were the sinking (June 19) by the Federal corvette "Kearsarge" of the Confederate steamer "Alabama," commanded by Captain Semmes, which had caused great devastation among the Federal shipping, and the destruction (August 5), by Admiral Farragut, of the Confederate flotilla at Mobile. The war closed in 1865 by the defeat of Lee at Five Forks, Va. (March 31-April 2), by Sheridan, who again defeated Lee at Sailor's Creek (April 6). Lee subsequently surrendered (April 9) his army to Grant, who had occupied Richmond, the capital of the Confederate States (April 2) on its evacuation by the Southern forces. The other Confederate armies soon afterwards surrendered. An amnesty, with certain limitations, was proclaimed (May 29) by President Andrew Johnson (1865-69), who, as vice-president, succeeded Abraham Lincoln, assassinated in Ford's Theater, Washington, by J. Wilkes Booth (April 14), Lincoln having but newly entered on his second term of office.

Russo-Turkish Wars. Of the many wars between the Muscovite and Mohammedan powers, we cite the two latest: (1) The first arose from a demand on the part of Nicholas, the Czar of Russia, of a protectorate over the Greek Christians in Turkey. The Sultan refused the demand, and appealed to his allies. Russia declared war against Turkey, November 1, 1853. England and France declared war against Russia, March 27, 28,

1854. Sardinia joined the allies, January 26, 1855. Among the great battles of this war were Alma (September 20, 1854), Balaklava (October 25, 1854), during which occurred the memorable "Charge of the Six Hundred." Inkerman (November 5, 1854), Tchernaya (August 16, 1855), in all of which the Russians were defeated. The great event of the war was the siege of Sebastopol (commenced October 17, 1854), which fell September 8, 1855. The war which is usually termed the Crimean war, was ended by the treaty of peace concluded at Paris, March 30, 1856. One of the articles of this treaty was that the Christians of Turkey, without any preference to Russia, should have the protection of all the Powers concerned in the treaty. (2) The second war arose (1877-8) from substantially the same cause as the war of 1853-6, viz., the desire of Russia to protect the Greek Christians of Turkey. By a protocol of March 31, 1877, the Great Powers agreed to see the promised reforms of Turkey carried out. This protocol was repudiated by Turkey, and war was declared by Russia against Turkey, April 24. Among the more prominent events of this war were General Gourko's march through the Balkans (July 13), his defeat by Suleiman Pasha at Eski Sagra (July 30), and Suleiman Pasha's desperate, but fruitless, attempt to gain the Schipka Pass, held by General Gourko; the fall of Kars (November 18), and of Plevna (December 10), and Suleiman Pasha's defeat by Skobeloff and Radetsky at Senova (January 9, 1878), the battle which virtually ended the war. Treaty of San Stefano (March 3), modified by treaty of Berlin (July 13), by which Bulgaria was created an automatic and tributary principality, Servia and Roumania were declared independent, and Bosnia and Herzegovina were ordered to be occupied and administered by Austria.

Zulu War (1879). Cetewayo, king of Zululand, became embroiled with the British, on the annexation by the latter of the Transvaal and the British, under Lord Chelmsford, crossed the Tugela, and entered Zululand (January 12). They suffered a terrible reverse at Isandhlwana (January 22), with a loss of eight hundred men, and, in spite of the heroic defense of Rorke's Drift (January 22), had to retreat. Eventually reinforcements arrived, and the Zulus were defeated at Ginghloni (April 2), and Ulundi (July 4). Cetewayo was captured (August 28), and a dispatch from Sir Garnet Wolseley (September 3) announced the end of the war. Cetewayo died (February 8, 1884), the New Republic was formed by a party of Transvaal Boers (1886-87), and the annexation of the remain-

der of Zululand as a British possession was proclaimed (June 21, 1887). Trouble subsequently arose, and several Zulu chiefs were convicted of high treason and sentenced to various terms of imprisonment (1888-9). Towards the end of 1891, the resolution of the colonial authorities to impose Zibebu as chief upon the northern tribes, was protested against by Miss Colenso as likely to lead to further troubles in Zululand.

Franco-German War. The friction between France and Prussia, arising from the proposed cession of Luxembourg, became accentuated by the demand of France that the Crown of Spain, offered (1870) to Prince Leopold of Hohenzollern, should not be accepted by that Prince. On the refusal of Prussia to accede to this request, war was declared by France (July 19, 1870). The Prussian forces, about 640,000 strong, in which were associated the states of the North and South German Confederation, were divided into four armies, the first, that of the North, commanded by General Vogel von Falkenstein; the second, that of the Center, commanded by General Steinmetz; the third, that of the Right, under Prince Frederick Charles, and the fourth, that of the Left, led by the Crown Prince, the King (William) of Prussia being commander-in-chief, with General Von Moltke as head of the staff. The whole army was in the highest state of preparation and efficiency.

The French army, about 300,000 strong, on the other hand, badly organized and practically unprepared for the contest, was formed into six army corps, respectively commanded by Generals Frossard, De Failly, Bazaine, MacMahon, Ladniérault and Marshal Canrobert. The Emperor, nominally commander-in-chief, had as his second in command, General Le Boeuf, to whom, later, Marshal Bazaine succeeded. The war resulted in an almost unbroken series of successes for the Germans. After victories at Woerth and Forbach (both on August 6), the Germans invested the fortress of Strasbourg (August 10—capitulated September 28), and sat down before Metz, which capitulated (October 27), after the battles of Longueville (August 14), Mars La Tour (August 16), Gravelotte or Rézonville (August 18), and unsuccessful attempts at a sortie by Marshal Bazaine (August 26 and October 6). At Sedan the French under Marshal MacMahon were hopelessly beaten (September 1), and the Emperor surrendered to the Prussian king (September 2), and was deported as prisoner to Wilhelmshöhe (Cassel). At Paris (September 4) the deposition of the Imperial dynasty was declared, and the establishment of a Republic proclaimed by M. Gambetta and

other members of the Left in the Legislative Assembly. A government of defense was proclaimed, with General Trochu as President, M. Gambetta as Minister of the Interior, M. Jules Favre (Foreign), General Le Flo (War). The Empress Eugénie fled from Paris (September 4), and settled at Chiselhurst. Negotiations for peace between M. Favre and Count Bismarck ended in failure (September 24), and a proclamation from the Government at Tours was issued calling upon the people "to fight to the bitter end."

The siege of Paris was commenced by the Germans (September 15), and five days later the troops at Versailles surrendered, and the Crown Prince of Prussia occupied the place. A *levée en masse* of all under twenty-five years of age was ordered by the Government (September 23), and all Frenchmen between twenty and twenty-five years were prohibited (September 26) leaving France, those between twenty-one and forty years being organized as a national *garde mobile*. M. Gambetta, escaping by means of a balloon from the beleaguered city (October 7), was appointed by the government at Tours, Minister of War.

An attempt on the part of the Red Republicans at Paris, headed by Blanqui, Lédru-Rollin, and others to establish a Commune in that city, was successfully defeated (October 14). The news of the capitulation of Metz caused riots at Paris (October 31). As the result of a *plébiscite* to confirm the powers of the Government of Defense, the votes recorded were 557,976 for, 62,638 against. The successes of the German arms continued, the army of the Loire was defeated by the Grand Duke of Mecklenburg (November 17), the fortresses of Verdun (November 8) and Thionville (November 27) capitulated. The army of the Loire under General Chanzy was again attacked and defeated at Beaugency (December 8). After various battles, the army of the Loire, fighting and retreating, was defeated by Prince Frederick Charles at Le Mans (January 11, 1871), and near Vosges (January 15, 16).

The army under General de Paladines, intrenched at Orleans, suffered defeat by Prince Frederick Charles (December 4), and Orleans surrendered, Rouen being two days later occupied by General Manteuffel, who engaged the army of the North under General Faidherbe at Pointe à Noyelles (December 23), and at Bapaume (January 2, 3, 1871), the French retreating in each case. General Bourbaki was also defeated by the German general Von Werder, near Belfort (January 15-17), and General Von Goeben gained a victory over the French under Faidherbe at St. Quentin (January 19). After gallant but unsuccessful sorties

from Paris by Generals Trochu and Ducrot (November 20 and January 21), the city, which had been bombarded, capitulated (January 28). Following the fall of Paris, General Bourbaki's army was defeated (January 30-February 1) by the Germans under General Manteuffel, and driven across the frontier into Switzerland. The fortress of Belfort capitulated (February 16) with military honors after a long defense. An armistice took place preparatory to negotiations for peace. On the resignation of M. Gambetta a National Assembly was elected (February 8) of which M. Grévy was chosen president, M. Thiers becoming head of the executive power. The French Government was recognized by the chief European powers (February 18), and (February 26) preliminaries of peace were signed by MM. Thiers and Favre and fifteen delegates of the National Assembly on the part of France, and Count Bismarck on the part of Germany. By this France was to cede certain parts of Lorraine, including Metz and Thionville and Alsace, excluding Belfort. In addition, five milliards of francs (\$1,000,000,000) were to be paid as war indemnity to Germany; certain departments to be occupied by German troops until this was fully discharged. The treaty, signed February 26, was accepted by the National Assembly sitting at Bordeaux (March 1), by 546 votes to 107, at the same time unanimously confirming the fall of the Empire. The Germans, after occupying Paris for forty-eight hours (March 1-3), withdrew from Versailles (March 12). A Peace Conference met at Brussels (March 28), and at Frankfurt a definite treaty of peace was signed (May 10), and ratified by the French Assembly (May 21). The last installment of the indemnity was paid September 5, 1873, and the last of the German troops quitted French soil (September 16). The Red Republicans under the lead of Blanqui, Gustav Flourens, and Felix Pyat rose in revolt (March 18, 1871) against the Government, held Paris and established the Commune, which was not suppressed until the insurgents had committed many outrages and destroyed much property, after holding possession of Paris until May 28, when the troops under Marshal MacMahon captured the city; some eight hundred troops were killed, the Communist forces losing fifty thousand. One fourth of Paris was destroyed, the loss to property being estimated at \$160,000,000. Great numbers of the Communists were subsequently tried, some executed, and the remainder transported. Since this period France has enjoyed a respite from martial dissensions, though the temper of the people is a continual menace to stability of rule.

Philippine War.—The Philippine Islands, an archipelago in the Pacific Ocean, southeast of Asia, separated by the China sea from China and the Indo-Chinese peninsula, became a possession of the United States in 1899, in accordance with terms of the treaty of Paris of that year, arranging peace between the governments of the United States and Spain. These islands, said to exceed 1,400 in number, had been under Spanish dominion for centuries, since their discovery by Magellan in 1521. The Bay of Manila, on which is located the city of the same name, the capital of the islands, was the scene of the first engagement in the Spanish-American War, the American squadron on the Asiatic station, under command of Commodore Dewey (now Admiral), attacking and destroying the Spanish squadron, commanded by Admiral Montijo in the morning of May 1, 1898. At the close of the war the islands were ceded to the United States, as agreed on in the peace negotiations, in consideration of the payment to Spain of the sum of \$20,000,000. The natives of the islands, known as Filipinos, have been for some time in rebellion against Spain when the war began, their principal grievance being against the religious orders, which, it was alleged, used their power with the Spanish authorities to extort money and gain absolute power over the natives of the islands. Having signed a compact with the Philippine authorities, accepting promises of reform and a large sum of money, twenty of the leaders of the revolution surrendered and took up their abode in Hong Kong. The insurrection, however, continued, and when Admiral Dewey destroyed the Spanish fleet, a large number of armed Tagalogs surrounded Manila. Aguinaldo and his chieftains in Hong Kong, taking advantage of the presence of the American squadron, were eager to return to the islands as friendly allies of the Americans. Consul-General Wildman, of Hong Kong, and Consul-General Pratt, of Singapore, were visited by the insurgent chieftains and it was arranged with Admiral Dewey to permit Aguinaldo and the chieftains to return to the Philippines aboard the American ships. Dewey was without land support, the American force not having arrived, and it was deemed expedient to establish friendly relations with the Filipino army laying siege to the blockaded port. Under promise that Aguinaldo would place his forces under command of the American admiral and generals, Consul-General Wildman placed the insurgent leader and his suite aboard an American vessel one week after the naval battle of Manila harbor. The insurgents were permitted to try to land arms and soon

had a formidable force in the field, taking some seven thousand Spanish prisoners and occupying most of the territory outside of Manila, establishing a dictatorial government and assuming a national independence. When the terms of peace with Spain were made known to the Philippine people and American sovereignty was declared over the archipelago, Aguinaldo and the Filipino leaders demanded the recognition of the Filipino Republic, the repulsion of the friars, and asked for American naval protection. For months the tension between the American forces under Generals Green, Merritt, and Otis and the Filipino army had grown until the smoldering hostility culminated in the outbreak of February 4, 1899. Aguinaldo proclaimed war against the United States, and a battle occurred with terrible loss to the Filipinos, their main forces being driven back several miles from Manila.

The principal events of the struggle which followed, ending with the pacification of the islands and the substitution of civil for military control, were frequently sharp and decisive, though more often must be characterized as mere gunning expeditions.

The war had become a desultory contest, with guerrillas in the less accessible parts of the islands, in 1901. The Federal party, organized among the Filipinos late in 1900 to favor American rule, petitioned Congress in January to authorize the President to establish civil government in the Philippines. Aguinaldo was captured on March 23, and took the oath of allegiance on April 2. Municipal civil government was established at Manila, May 3. On June 21 President McKinley promulgated an order establishing civil government in the islands and appointed Judge William H. Taft Governor. The civil government was inaugurated at Manila with imposing ceremonies on July 4. On the same date Major-General MacArthur turned over the military authority to his successor, Major-General Chaffee. In his annual report to the War Department, dated July 4, 1901, General MacArthur stated that between May 5, 1900, and June 30, 1901, there were 1,026 meetings between American troops and insurgents, with the following casualties: Americans killed, 245; wounded, 490; captured, 118, missing, 20. Insurgents killed, 2,854; wounded, 1,193; captured, 6,572; surrendered, 23,095.

The pacification of the Philippines was declared complete during the summer of 1902, and President Roosevelt formally declared the restoration of peace, issuing at the same time, on July 4, a proclamation extending general amnesty to the insurgents.

The Boer War.—It was on October 11, 1899, that the ultimatum presented to Great Britain by the government at Pretoria expired, and, as no satisfactory answer was received within the limit of time set, the order for the movement of the Boer forces was given. In this letter of ultimatum State Secretary Reitz had enumerated the grievances of the South African Republic against Her Majesty's Government, and had concluded by exacting the following conditions as the only ones under which a continuance of peace would be possible:—

The Ultimatum.—(a) That all points of mutual differences shall be regulated by the friendly course of arbitration or by whatever amicable way may be agreed upon by this Government with Her Majesty's Government.

(b) That the troops on the borders of this Republic shall be instantly withdrawn.

(c) That all reinforcements of troops which have arrived in South Africa since June 1, 1899, shall be removed from South Africa within a reasonable time to be agreed upon with this Government, and with the mutual assurance and guarantee on the part of this Government that no attack upon or hostilities against any portion of the possessions of the British Government shall be made by the Republic during further negotiations within the period of time to be subsequently agreed upon between the governments, and this Government will, on compliance therewith, be prepared to withdraw the armed burghers of this Republic from the borders.

(d) That Her Majesty's troops which are now on the high seas shall not be landed in any portion of South Africa.

Great Britain's failure to accept these conditions left no alternative but the immediate declaration of war, and on October 10, 1899, the proclamation of martial law in both the South African Republic and the Orange Free State was issued. Hostilities began on the 11th, when the Boer forces invaded Natal, and the chief events of the war which followed were:—

THE DIARY OF THE WAR.

- 1899.
- Oct. 12. Great Britain replies to Boer ultimatum. Mr. Conyngham Greene leaves Pretoria. Mafeking isolated.
13. Mafeking armored train disaster. First reconnaissance from Ladysmith.
14. Newcastle abandoned.
15. Action near Acton Homes. Militia called out.
20. Battle of Glencoe.
21. Battle of Elandsagte.
23. Sortie from Mafeking. Death of General Symons.
24. Boers defeated by General White at Rietfontein, near Ladysmith.
27. Sorties from Mafeking and Ladysmith.
30. Battle of Farguhar's Farm. Surrender at Nicholson's Nek.

- Oct. 31. General Sir Redvers Buller arrives at Cape Town.
- Nov. 1. Fighting near Colenso. Boers invade Cape Colony.
2. Ladysmith besieged.
3. Colenso evacuated. Proclamation of martial law in Northern Cape Colony.
5. Boers destroy the bridges over the Orange River.
6. Bombardment of Ladysmith commences.
14. Burghersdorp occupied by the Boers.
23. Victory of Belmont.
25. Battle of Enslin.
28. Battle of Modder River.
- Dec. 10. General Gatacre's reverse at Stormberg. Disaster at Magersfontein. Death of Gen. Wauchope.
15. General Sir Redvers Buller repulsed on the Tugela.
16. Lord Roberts appointed Commander-in-Chief in South Africa, with Lord Kitchener as Chief of Staff.
- 1900.
- Jan. 2. Colonel Pilcher defeats Boers at Sunnyside.
6. Attack on Ladysmith repulsed.
23. Spion Kop captured.
25. Spion Kop abandoned.
- Feb. 5. General Sir Redvers Buller crosses the Tugela.
7. Lord Roberts and Lord Kitchener leave Cape Town for Modder River.
11. Lord Roberts commences the Kimberley relief movement.
15. Magersfontein and Spytfontein evacuated. Boers capture a British convoy. Relief of Kimberley.
20. Lord Roberts defeats Boers at Paardeberg.
22. Severe fighting at Grobler's Kloof.
27. General Cronje surrenders to Lord Roberts. General Sir Redvers Buller captures Pieters Hill.
28. Relief of Ladysmith.
- March 5. General Gatacre occupies Stormberg.
7. Lord Roberts defeats Boers at Poplar Grove.
10. Lord Roberts defeats Boers at Driefontein.
13. Lord Roberts occupies Bloemfontein.
27. Death of General Joubert.
31. Koorn Spruit disaster.
- May 17-18. Relief of Mafeking.
28. Orange Free State annexed.
30. Mr. Kruger leaves Pretoria.
- June 5. Occupation of Pretoria.
12. Lord Roberts defeats General Botha at Diamond Hill.
- July 4. Lord Roberts and General Buller meet at Vlakfontein.
11. Surrender of Scots Greys and Lincolns at Ulval's Nek.
- Oct. 25. Formal annexation of the Transvaal.
- Nov. 6. Defeat of De Wet at Bothaville.
23. Dewetsdorp garrison captured by De Wet.
29. Lord Kitchener becomes Commander-in-Chief in South Africa.
- Dec. 11. Lord Roberts sails from Cape Town for England.
13. General De la Rey defeats General Clements at Nooitgedacht. Mishap at Zaaron.
16. Boer raid into Cape Colony.
29. Surrender of Liverpool at Helvetia.
- 1901.
- Jan. 3. Action with General Botha at Lindley.
18. Defeat of General De la Rey near Ventersburg.
- Feb. 28. Lord Kitchener confers with General Botha.
- March 18. General Botha breaks off negotiations.
- May 29. General De la Rey defeated by General Dixon at Vlakfontein.
- July 20. Death of Mrs. Kruger at Pretoria.
- Aug. 6. Lord Kitchener's Boer leader banishment proclamation.
- Sept. 17. Major Gough's force surrenders near Utrecht.
- Oct. 8. Martial law proclaimed throughout Cape Colony.
9. Commandant Scheepers's commando defeated by Colonel Atherton and Major Kavanagh.
11. Commandant Lotter sentenced to death and executed.
12. Commandant Scheepers captured.
14. Boers reach Baidanka Bay.

- Oct. 23. General Sir Redvers Buller relieved of his command.
- Dec. 10. General Bruce Hamilton defeats Boers at Trichardfontein.
18. Commandant Kritzinger captured.
28. Yeomanry rushed by Boers at Tweefontein under De Wet.
- 1902.
- Jan. 8. General Elliott engages General De Wet near Heilbron.
17. Commandant Scheepers executed.
26. Commandant Ben Viljoen captured.
30. Colonel Price defeats Commandants Wessels and Besters at Klarafontein.
- Feb. 3. Colonel Byng defeats Commandant De Wet near Reitz.
5. Major Leader defeats Boers near Klerksdorp.
10. Attack on convoy near Fraserburg.
16. Engagement with Commandant De Wet at Trommel.
18. Scots Greys sent off near Heidelberg.
23. Engagement of Colonel Byng's outposts; New Zealanders' heavy loss.
26. Convoy captured by Boers near Klerksdorp.
27. Great Boer drive, Harrismith line; 600 killed or captured.
- March 7. Lord Methuen's force and five guns captured by General De la Rey. Lord Methuen wounded.
13. Lord Methuen released and sent to Klerksdorp.
18. General Emmett and Commandant Celliers captured.
23. Mr. Schalk Burger, Mr. Reitz, and Commandants Lucas Meyer and Krogh arrive at Pretoria as peace delegates.
31. General Kitchener defeats General De la Rey near the Hart River.
- April 7. Commandant Kritzinger acquitted.
10. Boer leaders in conference at Klerksdorp.
12. Boer peace delegates arrive at Pretoria.
18. Peace delegates leave Pretoria to consult the commandoes.
30. Capture of Commandant Maurice Botha near Frankfort.
- May 7. Oorkiep relieved.
8. Armored train derailed near Pretoria.
15. Peace delegates confer at Vereeniging.
18. Boer delegates conclude conference at Vereeniging and go to Pretoria.

The Terms of Peace.—On May 31, 1902, the terms of peace were signed at Pretoria. They were as follows:—

(1) The burgher forces in the field will forthwith lay down their arms, hand over all guns, army rifles, and munitions of war in their possession or under their control, and desist from any further resistance to the authority of His Majesty King Edward VII., whom they recognize as their lawful sovereign.

(2) All burghers in the field outside the limits of the Transvaal and Orange River Colony and all prisoners of war at present outside South Africa will, on duly acclimating their acceptance of the position as subjects of His Majesty the King, be brought back to their homes as soon as transport can be provided and their means of subsistence assured.

(3) Burghers so surrendering or so returning will not be deprived of their personal liberty or their property.

(4) No proceedings, civil or criminal, will be taken against any of the burghers surrendering or so returning for any acts in connection with the prosecution of the war. The

benefit of this clause will not extend to certain acts contrary to the usages of war.

(5) The Dutch language will be taught in schools when the parents of the children desire, and will be allowed in the courts of law when necessary.

(6) Possession of rifles will be allowed in the Transvaal and Orange River Colony to persons requiring them for their protection, on obtaining licenses according to law.

(7) The military administration of the two colonies will at the earliest possible date be succeeded by civil government, and as soon as circumstances admit, representative institutions leading up to self-government will be introduced. The question of granting the franchise to rebels will not be decided until after the introduction of self-government.

(8) No special tax will be imposed on landed property in the Transvaal or Orange River Colony to pay the expenses of the war.

(9) As soon as circumstances permit, a commission, on which the local inhabitants will be represented, will be appointed in each district in the Transvaal and Orange River Colony for the purposes of restoration of the people to their homes and supplying those who, owing to war losses, are unable to provide themselves with food, shelter, and the necessary amount of seed, stock, implements, etc., indispensable to the resumption of their normal occupation.

(10) For this purpose the commissioners will be placed by His Majesty's Government in the possession of £3,000,000.

In addition to the above named grant of £3,000,000 His Majesty's Government will be prepared to make advances on loan for the same purpose, free of interest for two years, and afterward to be repayable over a period of years at 8 per cent. interest. No foreigner or rebel will be entitled to share in the benefits of this clause.

CIVIL LISTS OF EUROPEAN SOVEREIGNS.

Austria-Hungary, Emperor of, \$3,875,000.
 Bavaria, King of, \$1,412,000.
 Belgium, King of, \$860,000.
 Denmark, King of, \$227,775; and Crown Prince, \$33,330.
 Greece, King of, \$260,000, including \$20,000 a year each from Great Britain, France, and Russia.
 Italy, King of, \$2,858,000, of which \$180,000 for family.
 Netherlands, King of, \$250,000, also a large revenue from domains, and \$62,500 for royal family, courts, and palaces.
 Norway and Sweden, King of, \$575,525.
 Portugal, King of, \$634,440.
 Prussia, King of, \$3,862,770; also a vast amount of private property, castles, forests, and estates.
 Russia, Czar of, has private estates of more than 1,000,000 square miles of cultivated land and forests, besides gold and other mines in Siberia. The annual income has been estimated at about \$12,000,000.
 Spain, King of, \$1,400,000, besides \$800,000 for family.
 Württemberg, King of, \$449,050.

PRESIDENTS OF THE UNITED STATES.

* Adams married a minister's daughter, and was inclined to Unitarianism. Jefferson was not a believer, at least while he was Chief Magistrate. Madison's early connections were Presbyterian. Monroe is said to have favored the Episcopal Church. John Quincy Adams was like his father. Jackson was a Presbyterian and died in the communion of that church. Van Buren was brought up in the Reformed Dutch Church, but afterward inclined to the Episcopal Church. Harrison leaned toward the Methodist Church, and Tyler was an Episcopalian. Polk was baptized by a Methodist preacher after his term of office expired. Taylor was inclined to the Episcopal communion. Fillmore attended the Unitarian Church, and Franklin Pierce was a member, but not a communicant, of a Congregationalist Church at Concord. Buchanan was a Presbyterian, as was also Benjamin Harrison. General Grant attended the Methodist Church, and President Garfield the Church of the Disciples. President McKinley was a member of the Methodist Church. Roosevelt attends the Dutch Reformed Church.

SOME FAMOUS NAVAL BATTLES.

From the naval battle of Salamis to the great sea fight at Manila is a "far cry," B. C. 480 to A. D. 1898, more than 2,000 years. Salamis was the first great recorded battle of the world. Salamis drove the Persians from Greek soil; Manila drives Spain from Asiatic waters. The loss of life at Salamis has been variously estimated at from 5,000 to 50,000; at Manila from 400 to 2,000. Triremes were at Salamis, and shield and sword and brute numbers; at Manila the hell of monster guns and iron-clads, the scream of shell, and the carnage of high explosives. Salamis was fought in the youth of nations; Manila in the dawn of the greatness of the American people, the night of Spain. One notable parallel to Manila is found in the battle of the Nile, fought August 1, 1798—Lord Nelson and the English fleet against Admiral Brueys and the French fleet. Nine French line-of-battle ships were taken, two burned, and two escaped. The French L'Orient, with Brueys and 1,000 men on board, blew up, and only seventy or eighty escaped. Nelson's cry for this engagement was: "Victory or Westm'ister Abbey!" Other famous sea contests of the world are:

Winchelsea—English defeat 40 Spanish vessels and capture 36, August 29, 1350.

Harfleur—English capture or destroy 500 French vessels, August 15, 1416.

Gibraltar Bay—Dutch defeat the Spanish, April 25, 1607.

Dover Strait—Dutch destroy the English fleet, November 29, 1652.

Portsmouth—English defeat the Dutch and destroy 11 men-of-war and 36 merchantmen, February 18, 1653.

North Foreland—100 English and Dutch men-of-war engaged; 11 Dutch taken and 6 sunk, June 2, 1663.

Coast of Holland—English sink 30 Dutch men-of-war, July 31, 1663.

Santa Cruz—Spanish fleet burned by the English, April 20, 1627.

Harwich—Dutch lose 18 ships to the English, June 3, 1665.

Thames—Dutch lose to English 24 men-of-war, 4 admirals killed, and 4,000 seamen, July 25, 1666.

Measina—Spanish fleet, 29 vessels, destroyed by English, July 11, 1718.

Gibraltar—English defeated combined fleets of Spain and France, September 13, 1782.

Trafalgar—Nelson sunk 10 French and Spanish vessels after fighting with 27 ships, 23 of the combined fleet; Nelson killed, October 21, 1805.

Navarino—The fleets of England, France, and Russia destroy 30 Turkish men-of-war, October 20, 1827.

Most notable of American naval battles preceding Manila are the following:

Coast of Scotland—Paul Jones captures the Serapis and Scarborough, 70 guns, September 23, 1779.

Off St. Kitts—The Constellation, 26 guns, captures the French L'Insurgente, 40 guns, February 9, 1793.

Coast of United States—Constitution, 44 guns, sinks the Guerriere, 38 guns, in 30 minutes, August 19, 1812.

Madeira—United States, 44 guns, captures the Macedonian, 40 guns, October 25, 1812.

Brazil—Constitution captures the Java, Dec. 29, 1812.

Demerara River—Hornet captures the Peacock, February 24, 1813.

Lake Erie—Perry, with 54 guns, defeats English fleet with 63 guns, September 10, 1813.

Lake Champlain—McDonough, with 86 guns, defeats English fleet with 96 guns, September 11, 1814.

Manila Bay—Rear Admiral Dewey, with six ships: the Olympia (flagship), Boston, Baltimore, Petrel, Raleigh, and Concord, destroyed Spain's Asiatic Squadron, 13 vessels, under Admiral Montojo: Isla de Cuba, Isla de Luzon, Castilla, Don Antonio de Ulloa, Don Juan de Austria, Reina Cristina, Callao, El Cano, El Correo, General Lezo, Hercules, Marques del Duero, Rapido; also the navy yard and nine batteries. American loss, eight wounded and about \$5,000 damage to ships. Spanish loss, about 1,200 killed or wounded and some \$6,000,000 in vessels destroyed or captured. May 1, 1898.

Santiago de Cuba—Cervera's squadron of six vessels: the Vizcaya, Almirante Oquendo, Maria Teresa, Cristobal Colon, Furor, and Pluton, made a bold dash to escape from the harbor, and was destroyed by Sampson's fleet: The Oregon, Iowa, Indiana, Texas, Brooklyn, Gloucester, and Vixen. American loss: 1 killed, 2 wounded. Spanish loss: 390 killed, 165 wounded, 1,650 taken prisoners. July 3, 1898.

At Santiago de Cuba the armies and navies were both engaged. Army losses: United States, 272 killed, 1,000 wounded; Spain, 2,000 killed, 1,500 wounded, 1,650 taken prisoners. Total army and navy losses: United States, 274 killed, 1,002 wounded. Spain, 2,360 killed, 1,653 wounded, 3,300 taken prisoners.

In all her naval conflicts with England, France, Spain, and the Tripoli pirates, the United States has never sustained what would be considered a crushing defeat. She has lost individual vessels, but only after the most desperate resistance, giving proof of the saying that "Americans do not fight to save their skins."

DICTIONARY OF HISTORY.

Abbeys and Monasteries robbed of their plate and jewels by William the Conqueror, 1069; entirely dissolved by Henry the VIII., 1539. This ruler suppressed in England and Wales 643 monasteries, 90 colleges, 2374 churches and chapels, and 110 hospitals; and had the abbots of Reading, Glastonbury, and St. John's, Colchester, hanged and quartered for refusing to surrender their abbeys, and denying his supremacy.

Aberdeen, University of, founded 1494; King's College founded 1500; Marechal College founded 1593; the town of Aberdeen and its vicinity was visited by a destructive inundation August 8, 1829.

Aboukir, in Egypt, surrendered to the English forces March 18, 1801.

Abydos is a town of Asia Minor, situated on the Hellespont. Tradition places here the story of Hero and Leander; history tells that this was where Xerxes led his vast army over the Hellespont on a bridge of boats; and Byron here swam the Hellespont, and rendered it ever famous by his "Bride of Abydos."

Acres, taken by Richard I. and other Crusaders July 12, 1191, after a siege of two years and the loss of 300,000 men; attacked by the French under Bonaparte, who, falling in the twelfth assault, retired with great loss of men, May 21, 1799.

Actium, in Epirus, naval battle of, which rendered Augustus master of the Roman Empire, September 2, 81 B. C.

Adrianople, taken by the Ottomans, 1360; taken from the Turks by the Russians, 1829.

Agincourt, Battle of, between the French and English, gained by Henry V., October 25, 1415; 10,000 of the French killed. The English lost between 1,000 and 1,600 men. In the French army were four times as many men as in the English.

Aix-la-Chapelle, taken by the French, 1793; and again, September 21, 1794; Congress at, September 29, 1818.

Albans, St., the first battle between the Houses of York and Lancaster, in which the former was victorious, May 22, 1455; another battle was fought, February 2, 1461 between the Yorkists, under the earl of Warwick, and the Lancastrians, under Queen Margaret; the latter were the victors.

Alderton Moor, Yorkshire, Battle of, where the Royalists routed the Parliamentarians, June 29, 1643.

Alessandria, Italy, taken by the French, 1798; surrendered to the Austrians and Russians, July 24, 1799.

Alexandria, Egypt, built by Alexander in 332 B. C.; the walls were six miles in circuit; taken by Caesar, 47 B. C.; by Diocletian, 296 A. D.; by the Persians, 615 A. D.; by the Saracens, 640 A. D.; by the French, 1798. Battle of, between the French and English, in which the former were defeated, but the English general, Abercromby, was killed, 1801.

Alhambra, The, is a palace and fortress of the Moors, founded about 1248, by Mohammed I. Celebrated as the palace of the kings of Granada. Its two courts, that of the Myrtles and that of the Lions, are beautiful examples of Arabian art in Spain. The Alhambra was surrendered to the Christians by the Moors about 1491.

Albinos, called also *Leucoethiops*, or white negroes, and by the Dutch and Germans *Kakerlakens*, were at one time considered a distinct race, but closer observation has shown that the same phenomenon occurs in individuals of all races and that the peculiar white appearance rises from an irregularity of the skin. The iris of the eye is red in the Albino. Albinism occurs also in other mammals, birds, and insects.

Albany, first settlement was made by the French, at Mobile, in 1711. The commerce of the state is considerable, and its manufacturing interests are increasing rapidly; chiefly cotton and cotton goods, yarn, thread, iron, leather, and lumber. Its mining interests are being rapidly developed; but the principal industry is agriculture, cotton and corn being the leading productions. Various cereals, sugar cane, rice, and tobacco are also produced.

Alaska was purchased by the United States from Russia in 1867, for \$7,200,000 in gold, and was formally taken possession of October 18th of the same year by General Rouseau on behalf of the United States, at New Archangel, on the Island of Sitka. With the islands, it comprises 590,884 square miles, or nearly one sixth of the entire area of the United States previous to this purchase. The land abounds in fur-bearing animals; the seas yield fur-bearing seals and others, and

fish in immense quantities. Among other important resources of the Territory are lumber and minerals of all kinds. The southwestern part is covered for thousands of miles with dense forests of yellow cedar, white spruce, and balsam fir. Among the valuable minerals, coal has been found at different places along the coast; petroleum, lead, iron, and graphite at various points; copper, marble, and sulphur in great abundance; also gold and silver and valuable stones, such as amethysts, garnets, agates, and carnelians. The climate of the territory is very severe in the inland districts, but mild along the coast. At Fort Yukon the thermometer sinks as low as seventy degrees below zero in the winter; the summers are short and hot, the winters long and cold. In Southern Alaska the winter climate is the average winter climate of Kentucky, and the summer climate about that of Minnesota. The capital of Alaska is Sitka, and the Territory is governed by a Governor and other necessary officers appointed by the authorities at Washington. Alaska is divided into three judicial districts with headquarters at Juneau, Eagle City, and St. Nicholas. These courts appoint commissioners who act throughout the territory. With the developments following the great gold discoveries, Congress, in 1898, extended the Homestead Laws to Alaska.

Alexandrian Library, consisting of 400,000 manuscripts, destroyed by fire B. C. 47. The second library, of 700,000 volumes, was destroyed by the Saracens, under Caliph Omar. The story that they burned books instead of wood for six months is now discredited.

Algeria, formerly the country called Numidia, as united under Massinissa and Jugurtha. It became a Roman province 48 B. C.; afterwards it was independent, till the inhabitants invited Barbarossa the pirate to assist them against the Spaniards, who, however, seized it, 1516. Sometime afterward it became the property of the Turks; reduced by Admiral Blake, 1655; bombarded by the French, 1761; bombarded by the British fleet, and the Christian captives set free August 27, 1816. The French army, under the command of General Bourmont, landed in the Bay of Sidi Feraeh, June 14, 1830; the city was taken July 5th; and the whole of the territory of Algeria was subsequently reduced, and became a province of France.

Altars, in use from earliest times among Babylonians and Egyptians. The altars of Græco-Roman times became great monuments, such as that of Apollo at Delphi and of Jupiter at Olympus. The form varied according as the altar was used for incense, libations, forms and fruits or for bloody sacrifices. In the Christian Church all suggestions of heathen uses have been avoided.

America, first discovered by Christopher Columbus, 1492; South America, by Columbus, in 1498; and North America by John Cabot, a Venetian, 1497; thirteen colonies declared themselves independent of the British crown, July 4, 1776, and recognized as such by England, 1783. South American independence was established and recognized by the United States and England, who sent consuls to the new state, 1824. American Congress, first met at Philadelphia September 5, 1775; removed to Washington, 1801.

Amerigo Vespucci was a naval astronomer, from whom America accidentally received its name. He was born at Florence, March 9, 1451, and was at the head of a large Florentine firm in Seville in 1496. He fitted out Columbus' third fleet, and in 1497 sailed for the New World with Ojeda, and explored the coast of Venezuela in 1499. The accident which fastened his name on two continents may be traced to an inaccurate account of his travels published at St. Dié in Lorraine in 1507, in which he is represented to have reached the mainland in 1497, before either Cabot or Columbus, and in which the suggestion is made that he should give his name to the world he had discovered.

Anglesey, the Mona of the Romans, reduced by Julius Agricola, 78 A. D.; by the English, 1296. In early times it was the headquarters of Druidism and of resistance to Rome.

Anjou, Battle of, where the Duke of Clarence and 1,500 English were slain, 1421.

Anglo-Saxons, first landed in Britain 449.

Antioch, in Syria, built by Seleucus after the battle of Ipsus, B. C. 300; 100,000 of its inhabitants killed by the Jews in one day, B. C. 145.

Antonio, Battle of, in Mexico, between the Royalists and Independents, August 18, 1813; the latter were defeated.

Appian Way, aqueducts, etc., begun at Rome, B. C. 312.

Arkansas (Bear State)—First settlement, by the French, at Arkansas Post, 1686. Admitted to the Union in 1836. Ranks fifth in cotton, ninth in mules, twenty-second in miles of railway, twenty-fifth in population and in square miles, thirty-first in wealth. The mineral resources of the State are very large, and receiving much attention. Stock raising is extensive. Agriculture is the chief industry, corn, cotton, and wheat being the leading productions. *Oats*, tobacco, sweet potatoes, and fine fruits are also produced to a considerable extent.

Arbela, Battle of, when Alexander conquered Persia, B. C. 331.

Arcadians, Colony of, conducted by Evander into Italy, B. C. 1248.

Areopagus, The famous senate of, established at Athens in the reign of Cecrops, B. C. 1509.

Argentaria, in Alsace, Battle of, where the German tribe, the Alemanni, were defeated by the Romans, with a loss of 85,000 out of 40,000 men, May, 378 A. D.

Arizona was first explored by the Spaniards in 1536, and missions were established in this region before 1600. It ranks fifth in silver, eighth in sheep, ninth in gold. Mining and cattle raising are the chief industries.

Armada, The Spanish, consisting of 130 ships, with 30,000 men, arrived in the English channel July, 1588, but was defeated by the English and dispersed by a storm.

Arms, Coats of, became hereditary in families in the latter end of the twelfth century. They took their rise from the knights painting their banners with different figures, to distinguish them in the Crusades. The arms of England and France were first quartered by Edward the III., 1358; the French arms discontinued by the English king, January 1, 1801.

Army, first standing one in modern times, established by Charles VII. of France, 1445; introduced into England by Charles I., 1638; declared illegal, together with the Royal Guards, 1679. A legal one was established by William III.

Asenion, Judea, Battle of, where Richard I. defeated Saladin's army of three hundred thousand men, 1191.

Assyria, Kingdom of, began under Nimus, called Asur, B. C. 2084; lasted about one thousand two hundred and sixty-four years, ending with Sardanapalus.

Athens, founded by Cecrops, B. C. 1571; kingdom ended in Coderus, 1070; governed by annual archons, 684; city taken by Xerxes, 480; by the Romans, 87; by the Venetians, A. D. 1204; by the Turks, 1687; by the Greeks, 1826.

Austerlitz, Battle of, December 2, 1805.

Austria, anciently the Belgic Gaul of the Romans, taken from Hungary and annexed to Germany, when it received its present name, 1040; erected into a duchy, 1156; made an empire, August 11, 1804; Francis II., emperor of, made a formal resignation of the high office of Emperor of Germany, August 7, 1806. Austria and Russia united against France, August, 1805. The Austrian army, under Mack, surrendered at Ulm to Napoleon, October 20, 1805.

Avignon, taken from the Pope by the French, 1799; restored, 1778; declared to belong to France by the National Assembly, 1791; and confirmed by the congress of allied sovereigns, 1815.

Aztecs, The, were the early inhabitants of Mexico, who became highly civilized, and adopted a monarchical form of government in 1352. Their most celebrated king was Montezuma-Illumicamina, who erected several magnificent buildings, the remains of which are still to be seen. They believed in a Supreme Being, whom they never represented by sculpture or painting, as they believed him to be invisible. The Aztecs were conquered by the Spaniards under Cortez, 1521.

Babylon, founded by Nimrod, the grandson of Ham, B. C. 2640; city walled, 1248; taken by Cyrus, 538; by Darius, 511. According to Herodotus, the ancient city of Babylon stood on a broad plain, and was an exact square, 120 stadia (equal to fourteen miles) each way, so that the entire circuit of the city was 480 stadia. It was surrounded by a broad and deep moat, full of water, behind which rose a wall 50 royal cubits (equal to 93½ feet) in width, and 200 in height. On the top, along the edges of the wall were constructed buildings of a single chamber, facing one another, leaving between them room for a four-horse chariot to turn. In the circuit of the walls were a hundred gates, all of brass, with brazen lintels, and side-posts. Subsequent writers reduce the circuit of the city to 360 stadia, and the height of the wall to from 60 to 70 feet. The other walls ran along the

banks of the Euphrates and the quays with which it was lined, each containing twenty-five gates, which answered to the number of the streets they led into. The most remarkable edifice in the city was the Temple of Bel, a pyramid of 8 square stadia, the basement stage being over 200 yards each way. On the summit were a golden image of Bel, 40 feet high, two other statues of gold, a golden table 40 feet long and 15 broad, and many other colossal objects of the same precious metal. At the base was a second shrine, with a table and images, and altars. A similar temple stood at Borsippa, the suburb of Babylon; and it is believed that the ancient Babel of the Bible was also at Borsippa, a little below the later Babylon. The city came prominently into notice about 747 B. C., but its great importance dates from the fall of Nineveh, when Nabopolassar made it the capital of the Chaldean empire, and began the series of fortifications and public works, completed by his son, Nebuchadnezzar. It was several times dismantled, and, when Alexander the Great took possession of it, was a comparative ruin. Much of the material from which it was built was used by his successors to build Seleucia. That city, in its turn, fell into decay, and from its material several other cities were built, among them Bagdad. Since 1847 it has been established beyond reasonable doubt that the village Hilleh is located on the site of ancient Babylon.

Baltimore, Battle of, in which 9,000 British, under General Ross, were repulsed by the Americans, and General Ross killed, September 12, 1814.

Bannockburn, Battle of, between 30,000 Scotch and 100,000 English, when the latter were routed with a loss of 30,000 slain, June 24, 1314.

Barbers, the profession first brought to Rome from Sicily, B. C. 299; barbers and surgeons in London made one company, 1540; separated, 1744. They formerly exhibited a head or poll at their doors, and the barber's pole now used by them is a burlesque imitation of it.

Barcelona, said to be built by Hamilcar, the Carthaginian general, who subdued Spain; reduced by Louis XIV. of France, 1714.

Baron, Title of, first used in England, 1388. The barons attended Parliament in complete armor, in the reign of Henry III.

Baronets, English, first created, 1611; Scotch, 1625; thirteen new ones created, December 9, 1827.

Bastille, This famous French stronghold was re-modeled by Charles V., as a chateau, in 1369. It was formerly the castle of Paris. The high wall around it was subsequently erected by Philippe-Auguste. Louis XI. first used it as a state prison, and it was eventually demolished by the people during the Revolution, July 14, 1789. The "Man in the Iron Mask" was imprisoned there, and died in 1703.

Battle of Lake Erie, between the British squadron, commanded by Captain Barclay, and the United States, commanded by Captain Perry, in which the whole British squadron of two brigs, two ships, one schooner, and one sloop was captured, September 10, 1813.

Belgium, incorporated with the French republic, September 30, 1794; incorporated with Holland, 1815; became independent, 1830, establishing a monarchy with a perpetual exclusion of females and their descendants.

Belgrade, Battle of, between the Germans and Turks, when the latter were beaten and lost 40,000 men, 1456; the city taken by the Turks, 1690; battle of, between the Hungarians under Prince Eugene, and the Turks, when the latter were defeated, July 16, 1717.

Bermuda Islands, discovered 1522; settled 1609; settlements destroyed by a hurricane, October 11, 1780.

Bedouins, The, are that class of Arabs who lead a nomadic life. Living in the desert of Arabia, they have evolved characteristics as robbers and herdsmen intimately connected with their mode of life. Keen of physical sense, with active imagination, yet destitute of solid knowledge, the Bedouin unites independence and love of liberty, with a violent passion, an infamous love of plunder, and an entire disregard of the rights of property. They are professedly Mohammedan. Bigamy is rare; polygamy scarcely known.

Bible Societies, first established under the auspices of Thomas Charles, March 7, 1804; the Pope issued a bull against them, March 20, 1807.

Bithynia, a kingdom of Asia, conquered by Croesus, king of Lydia, B. C. 560; by Alexander, 332. From its ruins rose the Ottoman Turks, who made Prusa their capital, before they possessed Constantinople, 1328.

Blenheim, Battle of, between the English and French, when the latter were defeated, with a loss of 27,000 killed and 13,000 prisoners; while the total loss of

the English amounted to no more than 13,000 in killed, wounded, and prisoners, August 13, 1704.

Boudicca, queen of Iceni at the head of the Britons, attacked the Romans, burned London, and massacred 70,000 of its inhabitants; but being shortly afterward captured by Suetonius, poisoned herself, 62 A.D.

Boulogne, France, besieged and taken by Henry VIII., 1544; sold to France for 400,000 crowns, 1550; Sir Sidney Smith failed in an attack on the flotilla there, November, 1806.

Boyrne, battle of, between King William III., and King James II., when the latter was defeated, July 1, 1690.

Brazil, discovered by the Spaniards, 1500. The Portuguese settled there 1501; diamond mines discovered, 1730; the royal family arrives at, 1807; revolution took place, 1821; its independence declared and the prince regent declared emperor, 1822; the king of Portugal ratified a treaty recognizing its independence, 1825; war with Buenos Ayres, 1826; death of the dowager princess of, at Lisbon, August 8, 1829; revolution and expulsion of the emperor, Dom Pedro, and the appointment of a regency in the name of his son, 1831; became a republic, 1889.

Brochs are prehistoric structures in Scotland resembling low, circular, roofless towers, with walls of great thickness of unhewn stones, and inclosed by a narrow passage, chiefly in Orkney, Shetland, etc. The brochs of Mousa is a typical and the best preserved example.

Buenos Ayres, founded 1535 by Pedro de Mendoza; rebuilt, 1580; taken from the Spaniards by Sir Home Popham, June 21, 1806; retaken after an attack of three days, August 12; British attack on, under Lieutenant General Whitelock, in which the British were repulsed, July 6, 1837; declaration of independence published, July 19, 1816.

Bulgarians, defeated by Basilus, Emperor of the East, who made 15,000 of them prisoners and caused their eyes to be put out, except one in a hundred, whom he left one eye, that they might serve as leaders to the rest, 1014.

Byzantium, built by a colony of Athenians, B.C. 670. The seat of empire removed thither from Rome. A.D. 330, and its name changed to Constantinople.

California, first settled by the Spaniards, 1769, at San Diego. Ranks first in barley, grape culture, gold, and quicksilver; second in wool; third in hops; fifth in wheat and salt; seventh in silk goods; eighth in soap and silver; and ninth in wealth. Mining, manufacturing, stock raising, and agriculture form the principal industries of the state. Commerce is extensive with China, Japan, the East Indies, and Australia, and with other states and territories. No state in the Union has developed so rapidly.

Caledonia is the name given by the Romans to that part of Scotland lying between the Forth and the Clyde; the inhabitants were called Caledonii. The name disappears in the fourth century, and the people of Scotland began to be called Picts (to the east) and Scots (to the west). In more modern times Caledonia is a poetical name for Scotland.

Canada, discovered, 1499; settled by the French, 1534; Quebec built by Samuel Champlain, 1608; conquered by the English, 1769; ceded to them, 1763.

Canary Islands, discovered by Europeans in 1334; conquered by the Spaniards, 1491.

Candia, the ancient Crete, once subject to Greece, sold to the Venetians till taken by the Turks after 22 years' siege, 1669.

Canna, battle of where 40,000 Romans were killed by the Carthaginians, B.C. 216.

Carthage, founded by the Tyrians, B.C. 1259; built by Queen Dido, about 869; destroyed, B.C. 704.

Catalonia, Kingdom of, conquered by the Goths, 414; by the Saracens, 714; taken by the Moors, 800; united to Spain, 1492.

Central America. Under the name of Central America are included the republics of Guatemala, Honduras, San Salvador, Nicaragua, Costa Rica, and the territory known as British Honduras. In 1497 Pinzon discovered the eastern shore of Central America, and shortly afterward the Spaniards took possession of it, retaining it until September, 1821, when it declared its independence, and many of the states were annexed by the Mexican Confederation, from which they separated July 21, 1823, and formed the Central American Confederation, but in 1839 Guatemala withdrew, and Costa Rica and Nicaragua soon followed. In 1872 Guatemala, Costa Rica, San Salvador, and Honduras became united, forming the Central American

Union, the object of the union being the maintenance of peace in the several states and of the republican form of government.

The representatives of the Greater Republic of Central America, which was formed by the treaty of Amapala, concluded June 20, 1856, on August 27, 1856, adopted a federal constitution, in which the name was changed to "the United States of Central America." It was composed of the states of Honduras, Nicaragua, and Salvador. The Republics of Costa Rica and Guatemala did not enter into this union.

November 30, 1858, the Federal Organizers formally declared the union dissolved, the three States resuming respectively absolute sovereignty. The collapse was due to the failure of the troops of Honduras, acting in behalf of the Federal Organizers, to suppress an outbreak in Salvador against the proposed federation, and to force Salvador into the union.

The Central American coalition lasted nominally just one month. The new régime was ushered in by elaborate celebrations at Amapala on November 1. Under the proposed form of government, the administration was to pass into the control of a representative from each of the three republics—Dr. Salvador Callego, of Salvador; Señor Miguel Aguelugarte, of Honduras, and Dr. Manuel Corroel Matus, of Nicaragua. These were to continue in power until March 14, 1859, when they were to elect a president of the United States of Central America, to hold office four years. It was understood that the three States had virtually agreed upon Señor J. Rosa Facose, of Salvador, for the Executive chair. In the meantime the presidents of the three republics were to assume the grade of governors.

From the outset the Salvadorians opposed the coalition, as the expense of maintaining the federal government would have fallen chiefly upon them. General Regalado headed an insurrection, whose avowed purpose was to defeat the plans of the Federal Organizers. President Zelaya, of Nicaragua, declined to allow the Nicaraguan troops to suppress the outbreak, and the task was assigned to the armies of Honduras. The latter entered Salvador, but were compelled to retire unsuccessful. Thus, unable to bring Salvador into the union, the promoters of the coalition scheme had no alternative but to abandon it.

Chartists, The, were a body of the English people who on the passage of the Reform Bill (1832) demanded the People's Charter, the points of which were: (1) Universal suffrage; (2) vote by ballot; (3) annual parliaments; (4) payment of members; (5) abolition of property qualification; (6) equal electoral districts. Great demonstrations and damage done in 1839-1839. After demonstration and presentation of petition, April 10, 1848, the movement subsided, although the government had meanwhile dealt severely with some of the leaders.

Chaldeans, The, or Akkadians, are a non-Semitic race, who came originally from the mountain country of Elam, and were formerly the dominant people of Babylonia. One of the four great cities of Shinar was Accad. The Babylonians were indebted to the Sumer-Akkadians for their cuneiform writing, religion, and mythology.

Champ de Mars, The, or "Field of March," was a grand general assembly of Frank warriors, held from time to time in Gaul, from the fifth century till the time of Charles le Chauve (877), when all trace of them disappears. The objects of these conventions were twofold: (1) That of military reviews, in which the free-men came to pay homage to their chief and bring their annual gifts; and (2) consultative deliberations upon what expeditions should be made, what should be done for the defense of the nation, and what laws should be passed for the better government of the State. From 755 these assemblies were held in May. Napoleon I. announced a gathering to be held in the great plain called the Champ de Mars of Paris, on May 26; but it was not held till June 1, 1815. The object was to proclaim *L'Acte additionnel aux constitutions de l'Empire*.

Charing Cross was originally a London suburb, where was erected the last of the crosses in memory of Eleanor, queen of Edward I. The cross was destroyed in 1647, but a new one was placed on the spot in 1855.

Chillon is a celebrated castle of Switzerland, at the eastern end of the Lake of Geneva. It stands on an isolated rock, and long served as a state prison. Here for six years (1530-1536) Bonniard endured the captivity immortalized by Byron's "Prisoner of Chillon" (1821).

China, Monarchy of, commenced B.C. 2267; but its history does not extend above the Greek Olympiads. Fohi is by many writers supposed to be the founder of

the Empire, and its first sovereign, B. C. 2247. The country conquered by the eastern Tartars, when the emperor and his family killed themselves, A. D. 1644. First voyage to China from the United States made from New York, February 22, 1784.

Cimbri, The, were of disputed nationality. They made serious incursions into Italy, but were utterly routed by the Romans, 101 B. C., and were afterwards merged in the Saxons. They were among the most formidable enemies of Rome.

Colorado (Centennial state). First settlement, by Americans, near Denver, about 1850. Organized as a territory, 1861. Ranks first in silver, fourth in gold, eighth in square miles, seventeenth in miles of railway, thirty-fifth in population and wealth. About one third of the state is good agricultural land and easy of irrigation, bringing forth bountiful harvests of all the cereals. As a grazing and dairy country it is unsurpassed, its nutritious grasses having peculiar advantages for herding. Its chief production is mining; in its yield of gold and silver, it is the leading state of the Union.

Commune, The, is the unit or lowest division in the administration of France, corresponding in the rural districts to our township, and in towns to a municipality. The rising of the Commune at Paris in 1871, and which should not be confounded with communism, was a revolutionary assertion of the autonomy of Paris, that is, of the right of self-government through its commune or municipality. The theory of the rising was that every commune should have a real autonomy, the central government being merely a federation of communes. The movement was based on discontent at Paris, where the people found themselves in possession of arms after the siege by the Germans. The rising began on the 18th of March, 1871, and was only suppressed ten weeks later, after long, bloody fighting between the forces of the Commune and a large army of the central government; 6,500 Communists having fallen during 20-30th of May, and 38,578 having been taken prisoners.

Covent Garden, originally the garden of the Abbot of Westminster, is a spacious square in London, celebrated for a great market held within it of fruit, vegetables, and flowers. The square was formed in 1632, and is famous for its connection with the modern history of London.

Confederation of the Rhine, The, formed July 12, 1806, was a federation of the Germanic States, formed by Napoleon Bonaparte, whose disastrous Russian campaign (1812) caused the dissolution of the confederation, the Germanic Confederation taking its place.

Connecticut, first settled by the English at Windsor 1633. Ranks first in cloaks; third in silk goods; fourth in cotton goods; eighth in tobacco; fourteenth in wealth. Manufactures cotton, woolen, and worsted goods, hardware, jewelry, plated ware, leather goods. Agriculture and manufacture are carried on to a considerable extent. Several extensive granite and freestone quarries are successfully worked as are also mines of lead, copper, and iron. Many of the towns have an extensive coasting trade, and foreign commerce with the West Indies.

Comedy, the first acted at Athens on a stage, B. C. 552; those of Terence first acted, B. C. 154; the first regular one performed in England, 1551.

Constantinople, founded by Argives, B. C. 658; besieged and destroyed, 133; received its present name from Constantine the Great, who removed there the seat of the Eastern Empire, 330; suffered greatly by fire, pestilence, famine, and an earthquake, that overturned its walls and towers, 446; had first an emperor, 1268; taken from the Greeks by Mahomet II., who slew the emperor and 60,000 inhabitants—this put an end to the eastern empire, which began with the reign of Arcadius, 386, and continued 1056 years; the ambassadors of England and France arrived at, June 20, 1829.

Convention, for forming the constitution of the United States, met at Philadelphia, May 25, 1787, and reported the same to the States for adoption, September 17, of the same year.

Cook, Captain, sailed July 30, 1769, to go round the world; returned August, 1771; again to explore the southern hemisphere, July 13, 1772; returned July 29, 1775. Killed by savages on a voyage to the Sandwich Islands, 1779; ship returned, 1780.

Copenhagen burned, 1640 houses destroyed, 1723; Sir Hyde Parker and Lord Nelson passed the sound, and, after destroying the fleet, made peace with the Danes, April 2, 1801; garrison of, capitulated to the British troops after a severe bombardment of three days, September 6, 1807.

Cordova, the first Roman colony in Spain, settled by Marcellus; the residence of the Moorish princess, 709; kingdom of, destroyed, 1014.

Corsica, dependent on Genoa until 1768, in which year it was ceded to France. The Corsicans acknowledged George III. as their king, 1794; the island evacuated by the English, November, 1796, and has remained a French possession ever since.

Crusades, or Holy Wars, between the Christians and Mohammedans, which, in the end, cost the lives of two million men. The first, in 1095, was under Peter the Hermit and Godfrey de Bouillon; the second in 1146, under Emperor Conrad III. and Louis VII. of France; the third, in 1188, by Frederick Barbarossa, joined in 1190 by Philip II. of France and Richard I. of England; the fourth, in 1204, under Baldwin, Count of Flanders; the fifth, in 1228, under Frederick II.; the sixth, in 1248, under Louis IX. of France against Egypt; the seventh, in 1270, also by Louis IX., against Tunis, where Louis lost his life.

Curfew Bell was established in England in 1068, which, to prevent fires, obliged people to put out their fire and candles at eight in the evening, when the bells rang; abolished in 1103. The name is from the French "Couvre-feu," meaning cover fire.

Danes, their first descent upon England was at Portland, 787; their second in Northumbria, 794, when they were repelled and perished by shipwreck. Successive invasions took place up to the year 938; defeated the English at Ipswich, 1010; took Canterbury and put nine out of ten of the inhabitants to death, 1011; settled in Scotland, 1020; expelled the English, 1041; landed again at Sandwich, 1047, and carried off great plunder to Flanders; joined the Northumbrians, burned York, and slew 3,000 Normans, 1069; invaded England again, but, bribed by William II., quitted it, 1140.

Dakotas, The, first settled by Americans at Pembina. Admitted into the Union as two states, North and South Dakota, 1889. Ranks third in gold, ninth in silver, thirty-ninth in population.

Delaware, first settlement made by Swedes at Cape Henlopen, 1638. The principal industries are agricultural pursuits and mining. Fruit grows in great abundance. Considerable manufacturing is done in the northern part of the state.

Delft, one of the most ancient towns of South Holland, is situated on the Schie, eight miles northwest of Rotterdam by rail, and is intersected by numerous canals. Delft was noted from the sixteenth to the eighteenth century for its Delft ware, but has now entirely lost its high reputation for this manufacture.

Decemvirs, The, were men who drew up a code of Roman laws, and who, in 451 B. C., had the whole government of Rome in their hands. They were successful in their administration till the incident of Appius Claudius and Virginia led to the appointment of consuls.

Delphi was an ancient northern Greek town, celebrated for the oracles pronounced by the Pythian priestess in the temple of Apollo. The oracle was known as early as 900 B. C., and the temple became the repository of immense treasures. It was plundered by the Phocians and Nero, the latter taking away three hundred costly statues in 67 A. D.

Denmark, the ancient kingdom of the Goths; its first king reigned 714; embraced Christianity, 940; united with the Crown of Norway, 1412, and with Sweden, 1497; separated from Sweden in 1523; crown made hereditary and absolute, 1680; Copenhagen bombarded by the English, 1807; commercial treaty between Denmark and England, 1824.

Diana, Temple of, at Ephesus, said to have been burned by the Amazons about 1182; again by Erostratus, in order to perpetuate his name, B. C. 356; again by the Goths, in their third invasion, about 262 A. D.

Dionysius, Usurpation of, B. C. 409; besieged Rhegium, 388, and took it after eleven months; began the first Punic war, 384; expelled from Syracuse by Dion, 367.

Doomsday Book, The, or "Domesday Book" (1085-1086), was a statistical survey of that part of England which was under the sway of William the Conqueror. So called, probably, because it was of authority in all dooms, i. e., judgments in disputed questions which afterwards arose on matters contained therein. It was anciently known as the "Liber de Wintonia" (Book of Winchester), because at one time it was preserved in the royal treasury of that city, under three locks and keys. It was printed and published in 1783, in two folio volumes. In 1816 two supplementary volumes were published.

Dublin, city, wall built about 838; stormed by Dermond, 1171; its first charter granted, 1173; castle built, 1220; its University founded, 1591; Parliament House begun, 1739; finished, 1739; insurrection in and murder of Lord Kilwarden, July 23, 1803.

Duke, Title of, first given in England to Edward, son of Edward III., March 17, 1336; was held only by the sons of Henry VIII., 1572, but has since been renewed in many instances.

Egypt, The origin of the kingdom of Egypt is too uncertain to be definitely stated, but it is said to have lasted 1,663 years; conquered by Cambyse, 525; revolted from the Persians, assisted by the Achaemenians, 463; taken by Alexander, 332; reduced to a province, 31; conquered by the Turks, A. D. 1517; invaded by the French under Bonaparte, 1798, who, by the aid of the British, were eventually expelled, 1800. Egypt, since the year 1807, has been under the dominion of the Mohammedans.

England, originally inhabited by the Britons, a branch of the ancient Gauls or Celts; the western part in the time of the Romans was inhabited by the Belgæ; the northern part by the Brigantes; South Wales by the Silures, and Norfolk and Suffolk by the Iceni. Invaded by Julius Cæsar, B. C. 54; subdued by Claudius, 44, and completely so by Agricola, in 85 A. D. The Romans kept possession of it until 410. Conquered by the Saxons, 465, who were invited over by the ancient inhabitants, and who divided it into several warring kingdoms. Ravished by the Picts and Scots, 448. Erected into a kingdom by Egbert, by a union of all the kingdoms, 800-886. Conquered by the Danes, 877; recovered by Alfred, 878. Divided into counties and hundreds, 886; invaded by the Scots, who were defeated by Athelstan, 921; by the Welsh, 964; by Sweyn, king of Denmark, 1003; again by Sweyn and almost subdued by him, 1013; by the Irish, 1069; by Malcolm, king of Scotland, 1071, and again 1091; again, 1093, when Malcolm and his son were killed at Alnwick; by Robert, Duke of Normandy, 1101; by David of Scotland, 1136; by the Scots again, in 1183; by Henry, Duke of Richmond, 1485; England declared war against Spain, January 4, 1762; the famous dynasty of the Plantagenets commenced with the reign of Henry of Anjou. The Magna Charta was adopted during John's reign, in 1215. The reign of Elizabeth was signalized by the defeat of the Spanish Armada, 1588. James VI., of Scotland, was the first ruler of Great Britain.

Epirus, Kingdom of, first known in history by the great warlike achievements of Pyrrhus, about B. C. 280; a second Pyrrhus was renowned for his wars against the Romans, B. C. 280; became a republic, 240, but was subdued by the Romans, B. C. 167. It was finally conquered by Mahomet II., 1466, and became part of the Ottoman Empire.

Falk Laws, The, 1873, were so called from Dr. Falk, who insisted on the compulsory education of the clergy of Prussia. The laws are four in number: (1) The first was directed against the abuse of ecclesiastical discipline for political purposes, such as "boycotting," excommunication, and anathemas; (2) the next regulated the effect of secession from the Church on the obligation to meet certain taxes; (3) the third law was directed at the evasions by Roman Catholics of state education incumbent on all Germans; and (4) abolished the legality of papal tribunals, recognizing the judgments of the German ecclesiastical courts as the only authority on Church matters. In 1874 these four laws were supplemented by others, to insure more perfect obedience. Dr. Adalbert Falk was appointed by Prince Bismarck "Minister of Public Worship," January 22, 1872. In 1872 Prince Bismarck carried through the Prussian Houses a bill to transfer the control of primary education from the Church to the State authorities.

Famous Retreat, The, of the ten thousand, occurred B. C. 401-399. It was conducted by Xenophon, the historian, who had joined the expedition of Cyrus. In the battle of Cunaxa, Cyrus lost his life, and the Greeks were left without a leader. Xenophon volunteered to lead them back to Greece, and has left a historical narrative of this famous retreat, called "Xenophon's Anabasis."

Feudal System, The, consisted in dividing the kingdoms into baronies, giving them to certain persons and requiring those persons to furnish the king with money and a stated number of soldiers.

First French Revolution.—Its chief leaders: Comte de Mirabeau, 1789-1791; Danton, from the death of Mirabeau to 1793; Robespierre, from June, 1793, to

July 27, 1794. Next to these three were St. Just, Condron, Marat, Carrier, Hébert, Santerre, Camille Desmoulins, Roland and his wife, Brissot, Barnave, Sieyès, Barras, Tallien, etc. Its great days: 1789, June 17, the *Tiers État* constituted itself into the "National Assembly"; June 20, the day of the *Jeu de Paume*, when the Assembly took an oath not to separate till it had given France a constitution; July 14, Storming of the Bastille; October 5, 6, the king and National Assembly transferred from Versailles to Paris. This closed the ancient régime of the court. 1791, June 20, 21, flight and capture of the king, queen, and royal family. 1792, June 20, attack on the Tuilleries by Santerre; August 10, attack on the Tuilleries and downfall of the monarchy; September 2, 3, 4, massacre of the state prisoners. 1793, January 21, Louis XVI. guillotined; May 31, commencement of the Reign of Terror; June 2, the Girondists proscribed; October 16, Marie Antoinette guillotined; October 31, the Girondists guillotined. 1794, April 5, downfall of Danton; July 27, downfall of Robespierre.

Florida (Peninsular State).—First settlement by the Spaniards, at St. Augustine, 1565. Admitted to the Union, 1845. Ranks third in sugar and molasses; sixth in rice; tenth in cotton; twenty-first in square miles; twenty-seventh in miles of railway; thirty-fourth in population; thirty-sixth in wealth. The inhabitants confine themselves to agriculture. The chief products are cotton, sugar cane, rice, corn, and sweet potatoes, and tropical fruits of great variety. There is considerable trade also in lumber.

France, the country of the ancient Gauls; a colony of the Belgæ from Germany were permitted to settle in it B. C. 200; conquered by the Romans, A. D. 52; by the Goths, Vandals, Alans, Suevi, and Burgundi, who divided it amongst them, from 400 to 486. The Franks, from whom the French are derived, occupied part of Brabant, one hundred and thirty years before the reign of Clovis; it is the only state in Europe that can boast a perpetual succession from the conquerors of the western empire. Its first king was Pharamond, who began to reign in 418; Clovis was the first Christian king, 481; the Assemblies, called the States-General, first met, 1302, and continued to 1614; the English crown lost all its possessions in France between 1341 and 1379. The Revolution in France began 1789; the nobility and all religious orders suppressed, 1790; Louis XVI. beheaded, January 21, 1793; his queen, Marie Antoinette, beheaded, October 16, 1793; Bonaparte made first consul, 1799; Louis XVIII. made his second entry into Paris, July 8, 1815; Louis was succeeded in 1824, by his brother, Charles X., who was expelled, with his family, in July, 1830, and the Duke of Orleans raised to the throne under the title of Louis Philippe, king of the French. In 1830 war was commenced with Algeria, which country, as a consequence, was ceded to France. In 1848, the Bourbons were again driven out, and a republic established, with Napoleon III. as president. In December, 1851, Napoleon seized the absolute power, set aside the constitution, and shortly afterward was crowned emperor. A war with Prussia was precipitated in 1870, at the conclusion of which the present republic was established.

Franks, The, arose from a confederacy of the inhabitants of the Lower Rhine and Weser about 240.

Freemasons, The society of, are said to have taken rise from a set of foreigners who called themselves freemasons, whose secrets were kept intact; they are said to have introduced the art of building with stone into England about 670; another version has it that the institution is as early as the building of Solomon's Temple. The first lodge opened in America was at Philadelphia, in 1731, and was called St. John's Lodge.

Friedland, The great battle of, between the Russians and French, in which the former were completely overthrown, with the loss of 80 pieces of cannon, and 17,000 men killed, June 14, 1807.

Games, Olympic, first celebrated in Elis by the Idæi Dactyli, B. C. 1463; instituted by Pelops, 1307; celebrated by Hercules, 1222; restored at Elis by Iphitus, Lycurgus, and Cleosthenes, 684; Isthmian, instituted at Corinth by King Sisyphus, B. C. 1326; restored, 584; Pythian, first celebrated by Adrastus, king of Argos, B. C. 1263; instituted at Delphi, in Greece, 591; Capitoline, instituted by Domitian, A. D. 86; Secular, celebrated at Rome, A. D. 88.

Genoa, Republic, founded B. C. 63; the present one, A. D. 950; the first Duke of, chosen 1237; republic restored to its liberties by Doria, 1528; bank failed, 1760; the city in 1793, then in possession of the French, was taken

by the United forces of Austria and England, and in 1815 was united to the Sardinian monarchy.

Georgia (Empire State of South). First settlement, by the English, Savannah, 1733. Ranks second in rice and sweet potatoes; third in cotton and molasses; fourth in sugar; seventh in mules; tenth in hogs; thirteenth in population; fifteenth in miles of railway; nineteenth in square miles; twenty-fifth in wealth. The leading industry is agriculture, the products being corn, rice, cotton, and sweet potatoes, and manufacturing, in which it leads all other Southern States, having fine facilities. Gold, iron, marble, and slate abound.

Germany, from Germann or warlike man, being anciently divided into several independent states, was insignificant in history until B. C. 25, when the people withstood the power of the Romans, and expelled them in 290; Charlemagne became master of the whole, 802. The Emperor of Germany assumed the title of Emperor of Austria, August 11, 1804. In 1521, at the Diet of Worms, Luther made his famous defense; religious dissensions occupied the country for a long period after the retirement of Charles V., in 1556, and in 1618, the Thirty Years' War broke out; Germany secured her religious freedom by the Peace of Westphalia, in 1648. The foundation of the Prussian monarchy was laid in 1675. Numerous wars took place during the eighteenth century, and constant mutations occurred in the map of Germany. Under the famous Fredericks, the Kingdom of Prussia developed into a first-class power. German unification began under William I.; the Franco-Prussian war was declared on July 19, 1870, and resulted in the complete unification of Germany; the king of Prussia, by the treaty, was proclaimed Emperor of Germany.

Ghent, Belgium, stands on 26 islands, connected with each other by 80 bridges. The city of Venice is built on 80 islands, connected by nearly 400 bridges. In Venice canals serve for streets, and gondolas for carriages.

Gibraltar, taken by Sir George Rooke, July 24, 1704; besieged by the Spaniards, February 24, 1727; again, May, 1781; besieged again by the Spaniards, from 1779 to 1783, when their floating battery was burned with red hot balls from the garrison commanded by General Elliott. Gibraltar has remained in the possession of the English since 1704.

Girondins, The, in English "The Girondists," were the pure republican party in the National Assembly and National Convention of the first French Revolution. So called because it consisted mainly of the deputies of the Gironde. This party was distinguished for its oratory, and for a time dominated the assembly; but, horrified at the September massacres, they condemned the Reign of Terror, and tried to bring in more moderate measures. This drew upon them the hatred of the demagogues, and on June 2, 1793, some twenty of the Girondists were arrested at the instigation of Robespierre, and on October 31 twenty of them were guillotined, among whom were Brissot, Gensonné, Vergniaud, Ducos, and Sillery. Valazé stabbed himself while he stood in the dock.

Gordian Knot, the knot of the thong in the wagon of Gordius who was elected king of Phrygia from driving a wagon, and which he afterward deposited in the temple of Jupiter. Whoever loosed this knot, the ends of which were not discoverable, the Oracle declared should be emperor of Persia. Alexander the Great cut away the knot till he found the ends, and thus interpreted the Oracle, B. C. 330.

Goths, The, who overran all the countries from the Baltic to the Euxine sea, first mentioned as invading the Romans, 250; waged war with them, 366; from which time may be derived the fall of the Roman Empire. The whole nation, a million in number, through fear of the Huns, removed to the waste land in Thrace, 376; rebelled against the Romans, 377, and were quelled; in 378 attacked by Valens, the Roman army was cut to pieces, and the emperor killed. The Goths capitulated and submitted to the Romans, 381; pillaged Rome and massacred the inhabitants, 410; slew 300,000 inhabitants of Milan, 539.

Granada, Kingdom of, conquered by the Moors, 711; in 1238 it became the capital of a new kingdom, and attained to almost matchless splendor; the last Moorish prince was conquered by the Castilians, 1492.

Grecian Monarchy. Established by Philip of Macedonia and completed by Alexander the Great's victory over Darius, the last Persian monarch, B. C. 323; empire began when divided from the Empire of the West in 395 and ended 1453.

Greece, The early history of, is surrounded with

legend and myth. The heroic age of Greece is a fragment of the poetic imagination. Hellen was claimed by the Greeks as their common ancestor, the popular belief being that from his sons, Dorus and Æolus, and his grandsons, Ion and Æchæus, sprang the four different branches of the nation—the Dorians, the Æolians, the Ionians, and the Æchæans. From first to last, Greece was divided into numerous independent states. Authentic history begins 776 B. C., when the first Olympiad was held. In B. C. 431, began the Peloponnesian war. Greece passed under Macedonian rule about 338 B. C.; in B. C. 214, occurred the first collision between the Greeks and the Romans; from the fifth to the eighth centuries Slavic and other foreign people appeared in Greece, but were finally expelled; in the twelfth century the Normans plundered and ravaged the cities of Thebes, Athens, and Corinth. In 1203, the Latin princes appeared in the Crusades, conquered Constantinople, and divided Greece among them, which divisions were swept away by the Turks in 1453. In 1687 the Christian league besieged and took Athens, and the Moslem rule was again established. In 1821 the Greeks attempted to throw off the Ottoman yoke and precipitated a struggle for independence which lasted 8 years. In 1829 the allied powers of Europe intervened and created Greece an independent kingdom; in 1866 a revolution in Crete strained the relations of Greece and Turkey; a renewed outbreak in 1896 led to a war with Turkey, which resulted in favor of Turkey, but did not imperil the independence of Greece.

Gretna Green is a village in Dumfriesshire, Scotland, and the place where, for nearly a century, runaway couples were made man and wife. These irregular marriages were discontinued by law in the year 1856.

Guelphs and Ghibellines. At the great battle of Weinsberg, in Suabia, A. D. 1140, the Emperor Conrad of Hohenstaufen, and Welf, uncle of Henry the Lion, Duke of Saxony, rallied their followers by the respective war cries, "Hie Walbungen!" "Hie Welf!" As the chief theater of the conflict of these parties was Italy, the original names took the Italian form of Ghibellini and Gueifi, and under these names they became two great parties, whose conflicts may almost be said to make up the history of Italy and Germany from the eleventh till the fourteenth century. The Ghibellini may, in general, be described as the supporters of the imperial authority in Italy, the Guelphs as the opponents of the emperors and adherents of the popes. Five great crises in the strife of the Guelph and Ghibelline parties are commonly noted by historians: Under Henry IV., in 1055; under Henry the Proud, in 1127; under Henry the Lion, in 1140; under Frederick Barbarossa, in 1159; and in the pontificate of the great champion of Church temporal power, Innocent III. The cities of northern Italy were divided between the two parties—Florence, Bologna, Milan, and other cities, as a general rule, taking the side of the Guelphs, while Pisa, Verona, and Arezzo were Ghibelline. In general, it may be said that the nobles of the more northern provinces of Italy inclined to the Ghibelline side, while those of the central and southern provinces were Guelph. After the downfall of the preponderance of the German emperors in Italy, the contest ceased to be a strife of principles and degenerated into a mere struggle of rival factions. From the fourteenth century the Guelphs or Ghibellines are seldom heard of as actually existing parties; but in the sense already explained, the conflict of principles which they represented is found in every period of political history.

Gypsy Tribes. Gypsies, a term applied to a mysterious, vagabond race, scattered over the whole of Europe, and parts of Asia, Africa, and America. Whence they originally came, is not definitely known, but India seems to have been the cradle of the tribe. They are called Bohemians, in France; Zingari, in Italy. For centuries past they have drifted about over Europe, in small bands, having no permanent homes; living by begging, fortune telling, and various tricks. The first notice of them, which occurs in European literature, is embodied in a free paraphrase, in German, of the Book of Genesis, written by an Austrian monk, about 1122. On August 17, 1427, a band of them, coming from Bohemia, made their appearance before Paris, which, however, they were not allowed to enter, but were lodged at La Chapelle Saint Denis. Other hordes succeeded these in the following years, spreading in rapid succession over all parts of Germany, over Spain, England, Russia, Scandinavia, and, indeed, over the remotest parts of Europe. The account which they most frequently gave of them-

selves was, that they originally came from "Little Egypt," that the king of Hungary had compelled about 4,000 of them to be baptized, had slain the remainder, and had condemned the baptized to seven years' wandering. In France, Germany, Scotland, and other countries, the most stringent laws were formerly enforced against them, and they were slain by thousands. The jargon spoken by the Gypsies is styled Romany, and contains many Sanscrit words and corrupted Hebrewisms.

Hanseatic League. The, was a trades-union to protect merchandise from pirates and the pillage of nobles. It began with the three towns of Hamburg, Bremen, and Lübeck, but ultimately contained eighty-five trading towns. The league was divided into four parts: They were (1) the Wendic cities of the Baltic; (2) the towns of Westphalia, the Rhineland, and the Netherlands; (3) those of Saxony and Brandenburg; (4) those of Prussia and Livonia.

Hebrew Race. The, is distributed over the Eastern continent as follows: In Europe there are 5,400,000; in France, 68,000; Germany, 562,000, of which Alsace-Lorraine contains 39,000; Austria-Hungary, 1,544,000; Italy, 40,000; Netherlands, 82,000; Roumania, 265,000; Russia, 2,562,000; Turkey, 106,000, and in other countries 85,000. Belgium containing the smallest number, only 3,000. In Asia there are 819,000; Asiatic Turkey, 47,000, in Palestine there being 25,000; Asiatic Russia, 47,000; Persia, 18,000; Middle Asia, 14,000; India, 19,000, and China, 1,000. Africa contains 850,000; Egypt, 8,000; Tunis, 55,000; Algiers, 35,000; Morocco, 60,000; Tripoli, 6,000, and Abyssinia, 200,000. The entire number of Hebrews in the world is nearly 6,300,000.

Heptarchy. The Saxon, consisting of the kingdoms of Kent, the South Saxons, the West Saxons, the East Saxons, Northumberland, the East Angles, and Mercia, commenced in the sixth century, and continued till 829, when Egbert reigned alone. The Saxons, notwithstanding this division of the kingdom, were subject to one monarch, who was called King of Britain; the monarchy was not then hereditary, but that person succeeded who had the greatest power.

Herculeanum. first suffered by an earthquake, 63 A. D.; totally overwhelmed, with Pompeii, by an eruption of Mt. Vesuvius, 79 A. D.

Hittites. The, were one of the most important tribes in the south of Canaan. They are mentioned in Gen. x. as the descendants of Heth, a son of Canaan. In the age of Abraham the Hittites inhabited Hebron and its neighborhood (Gen. xxiii.). The primitive seat of the Hittites was probably the Taurus mountains of Asia Minor, from whence, as indicated by the cuneiform records of Tel-el-Amarna, in the latter part of the eighteenth Egyptian dynasty, they invaded Syria, and later, in the reign of Rameses II., were settled at Kadesh, ultimately spreading to the south of Palestine. In race the Hittites were probably Turanian, and in their language allied to the Alarodian family. The peculiar hieroglyphic writings that are found on Hittite monuments in Syria, Asia Minor, etc., are beginning to be deciphered. In common with the Hyksos, the deity of the Hittites was Seti, the Egyptian Typhon, and the local goddess of Kadesh Anata, the Canaanitish goddess of war.

Hivites. The, were Canaanitish people, specially associated with the Amorites, dwelling in the time of Joshua (Josh. ix.) near the center of Palestine, and near Mount Hermon and Mount Lebanon, the latter being regarded as the country of the Amorites in the Egyptian texts, and Tel-el-Amarna tablets. The Hivites are first mentioned in Scripture in Gen. x. 17; they were subjected to tribute by Solomon, after whose reign their name no longer appears.

Holland. in 1433, after being ruled for four centuries as a province of France or Germany, came under the rule of the Duke of Burgundy. The war, growing out of an attempt to extend the power of the inquisition, between Holland and Spain, ended in 1648, when the Netherlands achieved their independence; was overrun by the French, 1794-1795; secret expedition against, commenced by the Duke of York, August, 1799; British troops evacuated, November, 1799; Louis Bonaparte proclaimed king of, June 11, 1806; decree for annexing it to France, July 9, 1810; the French expelled, 1813.

Holy Alliance. The, was a league formed by the Emperors Alexander I. of Russia, Francis of Austria, and King Frederick William III. of Prussia, after the second abdication of Napoleon. The main principles of the alliance were: 1. That the different Governments of Europe belonged to one family of nations. 2. That all

the different creeds of Christendom were to be accorded full and equal rights in the alliance. 3. That the Christian religion was to be regarded as the moral principle governing in the international conduct and comity of the states. 4. That the Christian religion was to regulate the whole system of public law. 5. That the allied sovereigns were to give one another united aid in all cases when required. A special article of the treaty also provided that no member of the Bonaparte family should ever sit upon a European throne. Alexander of Russia drew up the agreement and gave it a name. It was signed by the three monarchs, September 26, 1815, but it was not wholly made public until February 2, 1816. All the Governments of Europe, except Rome, which had not been invited, probably through fear that the Pope would claim the first place in its councils and thus revive the old difficulty of the supremacy of the Church over Christian Governments, and England, which had declined, became members of the alliance. The alliance accomplished but little, and after Alexander's death, in 1825, the compact lost authority, and the French Revolution of 1830 caused a wide breach between the parties to it. The formation of the Prussian Diet, in 1847, the European uprising in 1848, the re-establishment of the Napoleon dynasty in 1850, and finally the war of Russia against England, France, and Turkey in 1854, brought about the complete dissolution of the alliance.

Hottentots. The, are an African native race, occupying the country north from the Cape Colony to Mossamedes, stretching westward to the Atlantic, and bounded on the east by the Kalahari desert. Formerly a numerous nation, the Hottentots have been greatly diminished by the oppression of the Boers, and the race is now nearly extinct. The Hottentots include the Griquas, and Korannas.

Huguenots. Protestants first called so in France, from a German word signifying "allied by oath," 1560; massacre of them at Paris, August 24, 1572.

Hungary. the Pannonia of the ancients was subject to the Romans. B. C. 11. The kingdom was founded by the Magyars in 884; annexed to Germany under Charlemagne, but became independent, 920; the Turks contended with the Germans for it from 1540 to 1739, when, by the treaty of Belgrade, it was ceded to the latter; in 1848 occurred the Hungarian revolution, led by Kossuth, and which ended in the independence of Hungary, July 8, 1867; the dual monarchy between Austria and Hungary was established in 1867.

Huns. savage inhabitants of part of Siberia; their kingdom was founded B. C. 230; they overran China, B. C. 200; kingdom taken and divided, A. D. 485; conquered Scythia and Germany, about 432; the kingdom destroyed soon after the death of Attila, 453.

Idaho. Ranks sixth in gold, seventh in silver, twelfth in square miles, forty-third in miles of railway, forty-fifth in population. Population, 1890, 84,385. First settlement, by Americans, 1842. Organized as a territory, 1863. Admitted to the Union in 1890.

Independents. The, or Puritans, in the reign of Charles I. were called "Roundheads." The royalists were nicknamed "The Cavaliers." The former wore their hair short, and dressed with great simplicity; the latter wore their hair flowing over their shoulders, and dressed showily and expensively. The two came into collision about the expulsion of the bishops from the House of Lords. The Roundheads insisted on their expulsion, and the severance of the clergy from all secular and state offices. It was in this brawl that the two parties gave each other the nicknames of Roundheads and Cavaliers.

Indian Territory was originally set apart as a reservation for peaceful tribes. Organized in 1834, but not under the same forms of government as the other territories. The lands are held in common by the Indians, each being allowed to cultivate as much as desired, and whites can hold land only by marrying an Indian. Grazing and agriculture are the leading industries. Oklahoma was opened up to white settlers in 1889, and organized as a territory in the following year, its capital being fixed at Guthrie.

Indian War. King Philip's, commenced in New England and ended by his death, August 12, 1676.

Indiana. first settlement by the French at Vincennes, 1730. Ranks second in wheat; fourth in corn, hogs, and agricultural implements; sixth in coal, and population; seventh in horses, oxen, and other cattle, malt and distilled liquors, and wealth; ninth in hay and milch cows. The inhabitants are largely engaged in agriculture. Large quantities of corn, wheat, oats, porks, and beef

are exported. Its mining and manufacturing interests are constantly increasing.

India, East, first entered by the Aryans about 2000 B.C.; Alexander marched into, B.C. 328; discovered by the Portuguese, A. D. 1487; conquered in 1500, and settled by them in 1506; the first settlement was Goa; the East India Company, established 1600.

Illinois, first settlement made by the French at Kaskaskia, 1682. Illinois is in the front rank as an agricultural state, surpassing all others in the production of wheat and corn, and second to none in the extent of stock raising. It ranks fourth in population, and next to Missouri in manufacturing, and the sixth in the Union; its fruit and orchard products are very large. The state abounds in mineral production, coal, lead, and salt being the chief. Its great rivers and lakes present natural facilities for an extensive commerce. The railroads of the state are greater in the number of miles within the state than any other.

Iowa, first settlement made by the French Canadians at Burlington, 1788. Agriculture and mining are the leading pursuits. The state takes a leading position in the production of wheat, corn, and cattle. The manufactures are important and show great progress annually. It ranks first in hogs, second in milch cows, oxen, and other cattle, corn, hay, and oats; third in horses, fifth in barley, sixth in potatoes and rye, seventh in coal and wheat.

Ireland, anciently named Erin, Eri, Ierne, and Hibernia, was originally occupied by the Celts; in 432 Christianity was introduced by St. Patrick; from the eighth to the twelfth centuries perpetual warfare existed between the petty kings and their chiefs; conquered in 1172 by Henry II. of England, and apportioned among his Anglo-Norman followers; Parliamentary union with Great Britain took place in 1800; Catholic Emancipation Act passed, 1829; Fenian riots, 1867.

Iron Crown of Lombardy. The, is not an iron crown, but a magnificent gold diadem, containing a narrow iron band about three-eighths of an inch broad and one-tenth of an inch in thickness. This band was made out of a nail given to Constantine by his mother, and said to be one of the nails used in the crucifixion. The outer circlet of the crown is of beaten gold, set with large rubies, emeralds, and sapphires, and the iron band is within this circlet. The first Lombard king crowned with it was Agilulph, at Milan, in 591. Charlemagne was crowned with it; Friedrich III., in 1452; Karl V., in 1530; and Napoleon I., May 23, 1805, crowned himself with it as "King of Italy" in Milan Cathedral. It was given up to Victor Emmanuel on the conclusion of peace with Austria, in 1866. The motto on the crown is, "God has given it me; beware who touches it."

Israel, kingdom divided, B. C. 975; ended, and the ten tribes carried captive by Shalmaneser, king of Assyria, 721.

Issus, Battle of, between Darius and Alexander, B. C. 333.

Italy, the successor of ancient Rome, suffered considerable political change by the aggressions of Napoleon I. In 1801 Savoy and Piedmont were united to France, the Duchy of Milan formed the Cis-Alpine republic, to which, in 1805, the Duchy of Venice was added, forming with it the kingdom of Italy, and Genoa was incorporated with France; Naples was seized, the Pope was deposed, and all Italy, except Sardinia and Sicily, was subjected to France. In 1814, the states were restored to their former rulers, except the Duchies of Milan and Venice, which were given to Austria, and formed the Lombardo-Venetian kingdom. In 1848 the great revolution was inaugurated, originating from a simultaneous insurrection in Lombardy and Venice. February 26, 1861, Victor Emmanuel was declared king of Italy, under whom the kingdom was strengthened and consolidated. He was succeeded by Humbert, in 1878, who was assassinated in 1900. Victor Emmanuel III. succeeded to the throne.

Jacobins were the members of a political club which exercised a great influence during the French Revolution. It was originally called the *Club Breton*, and was formed at Versailles, when the States-General assembled there in 1789.

Jacobites (from the Latin *Jacobus*, "James") was the name given after the Revolution of 1688 to the adherents of the exiled Stuarts—James II. (1633-1701) and his son and two grandsons, James Francis Edward, the Chevalier de St. George (1688-1766), Charles Edward (1720-68), and Henry Benedict, Cardinal York (1725-1807).

Those adherents were recruited from the Catholics, the Nonjurors, the High Churchmen, and Tories generally, discontented and place-seeking Whigs, the Episcopalian and Highlanders of Scotland, and the great body of the Irish people.

Jamaica, discovered by Columbus, 1494; settled by the Spaniards, 1509; taken from the Spaniards by Admiral Penn, May 7, 1655.

Japan, Empire of, founded by Jimmu, 660 B. C., first discovered by the Portuguese, 1542; Buddhism was introduced into Japan in the sixth century; in 1549 St. Francis Xavier introduced Christianity; in 1614 the priests were exiled, and all foreigners expelled from the island; in 1616 massacre of the Christians began; commercial treaty between the United States and Japan ratified in 1854.

Jerusalem, Temple of, dedicated B. C. 1004; city taken by Nebuchadnezzar after a siege of eighteen months, 586; the second temple finished under Darius, B. C. 515; destroyed by Titus, A. D. 70; pillaged by the Persians, and 90,000 inhabitants killed, 614; taken by the Saracens, 637; taken by Godfrey of Bouillon, who was elected king of it, July 5, 1100; conquered by Saladin, 1187; now subject to the Turks.

Jugurthine War, begun B. C. 111, and continued five years.

Juries, first instituted, 970; trial of civil causes by in Scotland enacted, 1815.

Justice of the Peace, first appointed, 1076.

Justinian Code, first published, 529.

Kansas (Garden of the West). Settled by Americans. Admitted to the Union, 1861. Ranks fifth in cattle, corn, and rye, seventh in hay and miles of railway, ninth in hogs, horses, wheat, and coal, fourteenth in square miles, twenty-first in population, twenty-fourth in wealth. Agriculture and stock raising form the chief pursuits of the inhabitants. Every variety of cereal and farm products is raised in great quantities. Nearly 2,000,000 acres are mineral lands. Three fourths of the state is suited for agriculture.

Kentucky, first settled at Boonesboro, 1775, by the English. Agriculture is the main pursuit. Wheat, corn, hemp, flax, and tobacco are leading productions. Fruits of an excellent quality abound. Horses and cattle are reared in great numbers. Thousands of swine fatten in the woods. Mining is carried on to a large extent. Kentucky produces nearly one half the tobacco raised in the United States.

Knights Templars, a religious order instituted 1119; flourished in England during the reign of Henry II.; all of them in France arrested in one day; they were charged with great crime and great riches; 59 of them were burned alive at Paris, 1307; their order destroyed by Pope Clement V. in 1312.

La Belle Alliance is the name of a farm some thirteen miles from Brussels; ever memorable for being the position occupied by the center of the French infantry in the battle of Waterloo (June 18, 1815). Napoleon himself was in the vicinity of this farm, but Wellington was at Mont St. Jean, two miles further north. Between these two spots was La Haye Sainte, where were posted the French tirailleurs. The Prussians call the battle of Waterloo the "Battle of la Belle Alliance," and the French call it the "Battle of Mont Saint Jean."

Liberia. First settlement of, on the west coast of Africa, made in 1820, under the patronage of the American Colonization Society.

Ligny, Battle of, Prussians under Blucher, totally defeated by the French under Napoleon, June 16, 1815.

Lincoln's Inn, London, the palace of the Bishop of Chichester, about 1226; converted into an inn of court about 1310.

Louisiana (Creole state). First settlement by the French at Iberville, 1699. Admitted to the Union, 1812. Ranks first in sugar and molasses; third in rice; ninth in salt; twenty-second in population; twenty-seventh in wealth; twenty-eighth in square miles; twenty-ninth in miles of railway. Holding, as it does, the outlet to the Mississippi Valley, the state is able to control both the foreign and domestic trade of this large and rich section, hence commerce is large and important. The manufacturing interests are comparatively small, except in sugars and molasses. Agriculture is the chief pursuit. This state is the only part of our country producing sugar in large quantities. Cotton is largely cultivated, Louisiana ranking fourth in its production. The rice crop is also large. Indian corn and other cere-

als are also produced to a considerable extent. The tropical fruits are abundant.

Lombardy, kingdom of, began 573; made numerous conquests till 774, when Desiderius, their last king, was taken by Charlemagne and territories annexed to the German empire.

London, formerly called Augusta, founded by the Romans, 49; walled and a palace built, 868; city repaired by Alfred, 885; burned to the ground, about 912; nearly destroyed by fire, 1077, and again in 1110; the chief magistrate in the time of William I. was called port-reeve; Richard I. ordained two bailiffs, but King John changed them to a mayor; obtained their first free charter for electing their own magistrates, 1208; gates of the city taken down, 1760; London bridge built about 1088. The largest and richest city in the world.

Louisburg, taken by the English, July 27, 1758.

Lycurgus, established his laws at Lacedæmon, B. C. 884; his institutions renounced by the Spartans, 183.

Mahratta. A native Indian race which founded an empire in Central India in 1674. In 1803-05 Scindia, Holkar, and the Bohnsels were conquered by Wellesley and Lake and much of their territory was added to the British dominion. The Confederacy of Mahratta States came to an end in 1818.

Massachusetts, first settled by the English at Plymouth in 1620. Ranks first in cotton, woolen, and worsted goods, cod and mackerel fishing; second in commerce; third in manufactures, printing; and publishing; fourth in silk goods; fifth in soap and in wealth; sixth in iron and steel; ninth in agricultural implements. Its manufactured articles include leather and morocco, flour and meal, lumber and furniture, refined molasses and sugar, machinery, ship-building, animal and vegetable oils. Manufacturing and commerce chiefly engage the attention of its inhabitants. The middle and the western parts are fertile. Farms are highly cultivated.

Madagascar, first seen by the Portuguese, 1500; attempts at colonization were made by the English and French from 1644 to 1773. The island is at present a colony of France.

Madeira Islands, discovered by the Portuguese, 1419.

Madrid, built probably in 10th century B. C.; occupies the site of the ancient Mantua-Carpeanorum, called Majoritum in the Middle Ages. Its importance commenced in 1561, when it was made the capital of Spain by Philip II. It was held by the French from 1808 to 1812, and here Napoleon placed his brother Joseph on the throne of Spain.

Marriage, first institution of, by ceremony, ascribed to Cecrops, king of Athens, B. C. 1556; celebration in churches first ordained by Pope Innocent III. about 1200, although many ceremonies had previously been used to solemnize marriage; marriage in Lent forbidden by the Church, 864; forbidden to priests, 1015; publication of bans instituted about 1210.

Maryland, first settled by the English, 1634, at St. Mary's. The chief industries are agriculture and manufacturing. Corn, wheat, and tobacco are the leading agricultural products. Coal is mined extensively. Among other commercial products are flour and meal; smelted copper, refined sugar and molasses, cotton goods, lumber and furniture, malt and distilled liquors, tobacco and cigars, oysters, fish, and vegetables, leather goods, clothing, printing and publishing. The foreign commerce of the state is carried on chiefly through the city of Baltimore, which has all the advantages of a seaport. The chief exports are tobacco, flour, canned fruits, and oysters.

Maine (Pine Tree State). Settled by French at Bristol, 1625; admitted to the Union, 1820. Ranks fifth in buckwheat and copper; eighth in hops and potatoes; eleventh in hay; twenty-first in wealth; twenty-seventh in population; thirty-third in miles of railway; thirty-sixth in square miles. Industries: Extensive lumber and ship-building trade, fisheries, cotton, woolens, tanned and curried leather, boots and shoes, lime, etc. The agricultural portion of the state lies in the valley of St. John, and between the Penobscot and Kennebec rivers.

Magna Charta, The, founded mainly upon earlier Saxon charters and the charter of Henry I. in 1100, was the great document which the English barons compelled King John to sign at Runnymede (June 15, 1215). The most important provisions are: (1) No scutage or aid shall be raised, except in the case of the king's captivity, the knighting of his eldest son, or the marriage of his eldest daughter, except by the general council of the kingdom; (2) no freeman shall be imprisoned or dis-

seised, outlawed, or proceeded against other than by the legal judgment of his peer, or by the law of the land; (3) that right or justice shall not be sold, delayed, or denied to any; (4) that the civil court shall be stationary, and not follow the king's person. Other provisions were directed against the abuse of the power of the king as lord paramount, the tyranny of the forest laws, and grievances connected with feudal tenure. The Charter of Forests was granted the next year. Both documents have been confirmed by Act of Parliament thirty-two times.

Manitoba was first settled permanently by the English in 1812, though English traders first made their appearance in 1767. It is a wheat-growing country, and furs are also a leading product. All kinds of garden vegetables, as well as oats, barley, Indian corn, hops, flax, hemp, potatoes, and other root crops are easily raised. The grassy savannas of the Red River afford abundant pasture. The climate is very severe in winter, but occasionally hot in summer. Winnipeg is the capital.

Massacres at Alexandria of many thousand citizens by order of Antoninus, 213; of Thessalonica, when upwards of 7,000 persons were put to the sword by order of Theodosius, 390; of 35,000 persons at Constantinople, 532; of the Jews, 1189; of the Huguenots at Paris, by order of Charles IX., when 70,000 were destroyed, August 24, 1572; of the Swedish nobility at a feast, by order of Christian II., 1520; of the Christians in Croatia by the Turks, when 65,000 were slain, 1592; of the English factory by the Dutch at Amboyna, 1623, in order to dispossess them of the Spice Islands; by the Irish at the island of Magee, when 30,000 English Protestants were killed, 1641; of the whites in San Domingo by the negroes, 1803 and 1804; of the Greeks at Scio, 1823.

Mexico, first conquered by Spain, 1521, by Cortez; a revolution, fomented by the clergy, took place in 1810; in May, 1822, Don Augustin Iturbide was elected emperor of Mexico; he abdicated in 1823; became a federal republic in 1824 when the first constitution of Mexico was proclaimed, and Guadalupe Victoria became first president; in 1863, a French army invaded Mexico and occupied the capital. Under the patronage of Napoleon III., Maximilian of Austria became emperor of Mexico from 1864 till 1867, when he was shot and a republic re-proclaimed.

Minnesota (Gopher State). First settlement, by Americans, Red River, 1812. Admitted to the Union, 1858. Ranks fourth in wheat and barley; eighth in oats and hay; twelfth in miles of railway; thirteenth in square miles; seventeenth in wealth; twenty-sixth in population. The leading industries are: (1) Agriculture; the staple productions being corn, wheat, and oats, while other cereals are largely raised. (2) Lumbering; great quantities of lumber are sawed in this state, and immense rafts of logs are floated down the Mississippi, to be sawed in other states. (3) Manufacturing; the principal articles being sawed lumber and flour.

Missouri (Pennsylvania of the West). First settlement, by the French, at St. Genevieve, 1764. Admitted to the Union, 1821. Ranks first in mules; third in oxen; hogs, corn, and copper; fifth in population; sixth in iron ore, wool, milch cows, and horses; seventh in oats; eighth in wealth, wheat, and tobacco; ninth in sheep and potatoes; tenth in miles of railway; sixteenth in square miles. Agriculture is the leading occupation. Mining is extensively carried on in the section south of St. Louis. The iron resources of the state exceed those of any other. The manufacturing interests are large and increasing. The chief agricultural products are great crops of corn, wheat, rye, tobacco, hemp, and grapes.

Mississippi. First settlement made by the French at Natchez, 1716. This state ranks second in cotton; fifth in rice; fifth in mules and molasses; seventh in sugar. It is almost exclusively an agricultural state. Great quantities of rice, corn, sugar, and sweet potatoes are produced. Many tropical fruits grow in abundance. The labor is largely performed by negroes. Horses, mules, swine, and cattle are extensively raised.

Microscopes. First used in Germany, 1621; with two glasses, invented by Drebbel, 1624; solar, invented by Lieberkuk, 1470.

Milan, anciently Liguria, the seat of the Roman empire, 286; conquered by the Goths in the fifth century, who were dispossessed by the Lombards, 569; subdued by the Emperor Charlemagne, 800; the French expelled about 1525; taken by the Imperialists, 1714; recovered by France and Spain, 1743; restored to Austria, 1748; in

1805 the French made it the capital of the kingdom of Italy; in 1860 was incorporated with Lombardy in the kingdom of Italy.

Minstrels, originally pipers, appointed by the Lords of Manor to divert their copyholders while at work; owed their origin to the gleemen or harpers of the Saxons; continued until about 1560; female harpers not uncommon in Britain, 680.

Mint. First established in England in Anglo-Saxon times; for the coinage of money, 1818; mint of the United States first established at Philadelphia, April 2, 1792; coinage of gold commenced July 31, 1795.

Michigan (Wolverine State.) First settled by the French at Detroit, 1650; admitted to the Union, 1837. Ranks first in copper, lumber, and salt; second in iron ore; third in buckwheat and wool; fifth in hops and potatoes; sixth in wheat, barley, and wealth; seventh in agricultural implements; ninth in oats, population, and miles of railway, and twentieth in square miles. Agriculture, mining, lumbering, manufacturing, and commerce command the attention of the inhabitants. Large crops of wheat, corn, oats, and potatoes are produced, as also great quantities of wool, butter, and cheese. Fruit raising is extensively followed, the value of the orchard products exceeds that of New Jersey or California. The copper mines of the state are the richest known, and are extensively worked. The production of sawed lumber is greater than that of any other state. The value of manufacturing exceeds \$100,000,000. The fisheries form one of the secondary, yet important, sources of wealth, large quantities being taken for home use and export.

Montana ranks fourth in silver, and square miles; fifth in gold; fifteenth in cattle; thirty-fourth in miles of railway, and forty-fourth in population. The population of Montana, according to census of 1880, was 89,159; but in 1884 the total vote cast for delegate to Congress was 28,969, and in 1886, 32,252. In 1890, the population numbered 132,159. First settlement, by Americans, 1852. Organized as a territory, 1864. Admitted to the Union in 1889.

Mogul Empire. First conquered by Jenghis Kahn, a Tartar prince, who died 1226; Timur Bek became great mogul by conquest, 1399; the dynasty continued in his family until the conquest of Tamerlane in the fifteenth century; Kouli Khan, the famous Sophi of Persia, considerably diminished the power of the mogul, and since that event many of the nabobs have made themselves independent; the last sovereign, Shah Alim, became in 1827 a pensioner of England.

Monkery began in Egypt and Persia; tolerably well established about 880; in Egypt alone there were 96,000 monks. St. Anthony, the first example of a monastic life, 806, established the first monastery on Mt. Colzim, near the Red Sea. Athanasius introduced monastic life into Rome, 341.

Mount Vernon, memorable as the residence and the burial place of George Washington, is on the right bank of the Potomac, in Virginia, fifteen miles below Washington. In 1858 the mansion and surrounding property were saved from the auctioneer's hammer, and secured as a national possession.

Moors, driven out of Spain, after they had continued there 900 years, 1609, for attempting to free themselves from the Inquisition; they were in number about 6,000,000.

Morocco, Empire of, anciently Mauritania; possessed by the Romans, B.C. 25; about 1116 Abdallah, the leader of a sect of Mohammedans, founded the dynasty of Almohades, which ended in the last sovereign's total defeat in Spain, 1212; Morocco was afterwards seized by the King of Fer, but the descendants of Mahomet, about 1546, subdued and united the three kingdoms, and formed what is called the Empire of Morocco. The present sovereign of Morocco belongs to the ninth dynasty, founded in 1648.

Moscow, burned, 30,000 houses destroyed, in 1789; entered by the French, September 14, 1812, and burned by the Russians, in consequence of which the French retreated with great loss.

Museum, The British, established 1753; large additions made to the building and the library of George III. given to the institution by George IV., 1827.

Nantes, Edict of, passed by Henry IV., by which Protestants enjoyed toleration in France, 1598, revoked by Louis XIV., 1685; in consequence of which 50,000 French Protestants emigrated to England; they engaged largely in the manufacture of silk; some introduced the art of making crystal glasses for watches and pictures.

Naples, anciently Capua and Campania, kingdom of, began 1059; given by the pope to the Comte D'Anjou, 1266; Alphonsus of Arragon united Sicily to it, and the kings have since been called king of the Two Sicilies, 1442; taken from the French and annexed to Spain, 1504; order of the Crescent founded, 1464; taken by the French, January 14, 1799; Joseph Bonaparte was made king of Naples in 1806, but replaced by Murat in 1808; the Austrians took possession in 1814; in 1860 the last king of Naples was expelled by Garibaldi, and the two Sicilies were merged in the kingdom of Italy.

Nebraska. First settlement made by Americans. Beef, cattle, and other livestock are raised in great numbers upon the grazing sections. Corn, wheat, and other cereals, and fruit growing are carried on extensively and with great success. The cheap and fertile lands offer great inducements for settlement to immigrants.

New Hampshire (Granite State). First settlement by the English at Little Harbor, 1623. Ranks third in manufacture of cotton goods; fifteenth in potatoes; twenty-second in wealth; thirty-first in population; thirty-seventh in miles of railway; forty-first in square miles. Largely engaged in manufacturing; the abundant water power affords great advantages. Agriculture, pasturage, and drainage occupy a large number.

New Mexico. First settled by the Spaniards at Santa Fe, 1587; organized as a territory, 1850. Ranks eighth in silver; eleventh in gold; nineteenth in sheep, and twenty-second in cattle. Chief industries, mining and cattle raising.

Nevada. First settled, by Americans, in 1850. Ranks second in gold; fourth in silver; and thirty-seventh in wealth. The leading industry is mining. The mines of the state yield over three fifths of all the silver produced in the United States. Stock raising is also largely followed, owing to the large amount of good pasture land.

Netherlands were placed under the sovereignty of the house of Orange and became a kingdom, 1815; in that year, the Prince of Orange was elevated to the rank of King of the Netherlands, with increased territories, extending over the present kingdom of Belgium; Belgium was in 1831 erected into a kingdom, and the present limits of the kingdom of the Netherlands were defined in 1839.

New England. First settlement of, made at Plymouth, December 21, 1620; states united, 1643.

Newfoundland, discovered by Cabot in 1497; taken in possession by the English, in 1583; in 1713 it was declared by the treaty of Utrecht to belong wholly to Great Britain.

New Jersey (Jersey Blue). First settlement by the Dutch at Bergen, 1620. Ranks first in fertilizing marl, zinc, and silk goods; fourth in iron ore; fifth in iron and steel; sixth in buckwheat, manufactures, and soap; seventh in rye; twelfth in wealth; nineteenth in population; twenty-sixth in miles of railway; forty-third in square miles. Manufactures: Molasses and sugar refining, flour, machinery, leather, and leather goods, hats, caps, and clothing, woolen and cotton goods, bleaching and dyeing, glass, industries: The commerce of the state is small, its manufactures large and various. Its shad and oyster fisheries are extensive. Mining is also a leading industry. But its chief industry is agriculture and market gardening, the state being one immense garden, the mildness of its climate being such that small fruits are very productive, and, being adjacent to the markets of New York and Philadelphia, farmers and fruit raisers find large profits from their labor.

New Orleans. First laid out by the French, 1718; battle of, January 8, 1815.

New Zealand. Discovered in 1642, by Tasman, who examined the west coast; east coast explored by Cook, 1769; became a British colony, 1840.

New York (Empire State). First settlement by the Dutch at New York (New Amsterdam), 1614. Ranks first in value of manufactures, population, soap, printing and publishing, hops, hay, potatoes, buckwheat, milk cows, and wealth; second in salt, silk goods, malt and distilled liquors, and barley; third in agricultural implements, iron ore, iron and steel, oats and rye; fourth in wool and miles of railway; twenty-seventh in square miles. In population, wealth, and commerce, New York is the first in the Union. The commerce extends to all parts of the world. Manufacturing is large, and constantly increasing. Agriculture is one of the chief pursuits, wheat and corn being the staple productions. The development of the salt springs of the interior is also one of the industries of the state. Its magnificent system

of canals and railroads has done much to increase its domestic trade.

North Carolina (Old North State). First settlers, English, Cowan river, 1650. Ranks first in tar and turpentine; second in copper; third in peanuts and tobacco; fourth in rice; ninth in cotton; fifteenth in population; twentieth in miles of railway; twenty-third in wealth; twenty-sixth in square miles. Agriculture is the leading industry, the chief articles being corn, wheat, tobacco, sweet potatoes, oats, rice, and cotton. Vast forests furnish three times as much pitch, tar, and resin as all the other states together. There are valuable gold mines, and iron, copper, and coal abound.

Normandy, originally part of France, was ceded to the Northmen in 911; conquered by the French and ceded to them 1203-1204; taken by the English in 1418, and retained until 1449; finally joined to France under Charles VII.

Norway, the ancient Scandinavia, including Sweden, united with Denmark, 1028; in 1819 Norway and Sweden, for a short time, became united under Magnus V.; in 1897 Norway, Sweden, and Denmark were again united, which union remained in force until 1923, when Sweden emancipated herself; Norway was united to Sweden, November 4, 1814, by the convention of Moss.

Notaries Public, originally appointed by the Fathers of the Christian Church to collect the acts and memoirs of martyrs in the first century; since changed into commercial offices.

Nova Scotia, charter granted, 1621; afterwards in the possession of the French, but ceded to England, 1713; people deported by England, 1755.

Nova Zembla, discovered by Capt. Hugh Willoughby, 1553; has no permanent inhabitants.

Oath, swearing on the Gospels, first used, 528; first administered in judicial proceedings by the Saxons about 600.

Ohio was first settled by the English, at Marietta, in 1788. Ranks first in agricultural implements and wool; second in petroleum, iron, and steel; third in population, wheat, sheep, coal, malt, and distilled liquors; fourth in printing and publishing, salt, soap, and wealth; fifth in milch cows, hogs, horses, hay, tobacco, iron ore, and miles of railway. The agricultural interest is very large. Great crops of wheat, corn, oats, barley, hay, potatoes, garden and orchard products are raised; also flax, tobacco, and grapes. Coal and iron mining are extensively carried on in the eastern and southern parts, and large numbers of live stock are sent to the eastern markets. Its commerce by lake, river, canal, and railroad transportation, is very large.

Olympiads, games instituted at Olympia by Pelops, in honor of Jupiter, B. C. 1307; they were revived by the Greeks about 400 years after the destruction of Troy, and continued until the reign of Theodosius the Great, when a new code of reckoning began; the first Olympiads began July 28, 776, Cæresus being then the Olympic victor; the last ended about 440 B. C.

Ontario is the most important province of Canada. Principal products are grain, fruit, lumber, petroleum, copper, and iron. The population of Ontario is one third of the whole Dominion, Toronto, the capital, is the manufacturing and educational center. The population of the province is largely of British descent.

Oregon was first settled by the Americans in 1811. Agriculture, stock raising, and lumbering are the chief pursuits; wheat being the staple article of the former, while most of the cereals of the middle states flourish. Cutting timber from the immense pine forests of the state gives employment to great numbers of inhabitants.

Orange, Title of, first in the Nassau family by the marriage of Claude de Châlons, the sister of the Prince of Orange, with the Count of Nassau, 1580; the Prince of Orange was applied to by England for assistance, 1688; landed at Torbay, in England, with an army, November 5, 1688; took on him the government at the invitation of the Lords; declared King of England, February 18, 1689.

Organs. First introduced into churches by Pope Vitalian I., 658; into the western churches, 826.

Ostrogoths, their kingdom began in Italy, 476; ended 554.

Ottoman, or Turkish Empire, founded by Othman I., in 1299, in Asia Minor, and soon extended into Europe. With the capture of Constantinople, in 1453, it succeeded to the Byzantine Empire.

Paganism, finally overthrown in the Roman Empire in the reign of Theodosius between 383 and 395.

Palestines. Thirteen thousand of these poor Protes-

tants were driven by the French from their habitations on the banks of the Rhine in 1709-1710; and came to England; a brief was granted to collect alms for them. Five hundred families went under the protection of the government to Ireland and the rest were sent to New York and Hudson's Bay; they finally went to Pennsylvania, where they settled, 1709.

Pandects, a system of laws accidentally discovered at Amalfi, Italy, 1137.

Pantheon, The, at Rome, built by Agrippa B. C. 26.

Paris, made the capital of France, 510; consumed by fire, 568; barricaded to oppose the entry of the Duke of Guise, 1588; again, 1688, in opposition to the regency; first parliament held, 1802; general confederation in the Champ de Mars, July 14, 1790; an armed mob forced the Tuilleries and insulted the king of France, June 20, 1792; Tuilleries again attacked and Swiss Guard massacred by the Populists, August 10, 1792; royal family imprisoned in the temple, August 14; massacre of the state prisoners, September 2-5, 1792; Lord Malmesbury negotiated for peace, October 28, 1793; Napoleon arrived at midnight, December 18, 1812; allied sovereigns entered, March 31, 1814; Louis XVIII. entered May 3, 1814; Napoleon returned to, from Elba, March 21, 1815; left it to meet the allied forces, May 2, 1815; capitulated to the allies, July 8, 1815; treaties of general peace signed November 20, 1815.

Paul's, St., London, built by Ethelbert, King of Kent, on the foundation of an old temple of Diana, 597-610, burned, 1086; rebuilt and consecrated, 1240; it was 150 years building; again burned down, it was rebuilt, 1681; first stone of the present building laid, 1675; finished, 1710, at an expense of about \$7,500,000.

Persecution, by the Jews, the first in 33; first general of the Christians under Nero, 64; second under Domitian, 98; third under Trajan, 107; fourth under Marcus Aurelius, 166-177; fifth under Severus, 202; sixth under Maximinus, 235; seventh under Decius, 250; eighth under Valerian, 257; ninth under Aurelian, 275; tenth under Diocletian, 302; by the Arians under Constantius, 337; under Julian the Apostate, 361; Luther's followers persecuted in Franconia, 1526. The Protestants persecuted in England, 1556; in France, 1723.

Persian Empire, began under Cyrus after his conquest of Media, B. C. 536; ended in the conquest of Darius, about 330; a new empire called the Parthian was founded upon its ruins by the Persians under Artabaces, B. C. 260, but took its original name under Artaxerxes, 226; the Saracens, however, A. D. 641, put an end to that empire and Persia became a prey to the Tartars, and the province of Hindustan, until the emperor Kouli Kahn raised it to a powerful kingdom; emperor assassinated by his relatives, 1747.

Pennsylvania (Keystone State). First settlement, English, Philadelphia, 1682. Ranks first in rye, iron and steel, petroleum, and coal; second in wealth, population, manufactures, buckwheat, potatoes, printing, and publishing; third in miles of railway, milch cows, hay, soap; fourth in oats and tobacco; fifth in silk goods, wool, malt and distilled liquors; sixth in salt, copper, and agricultural implements; eighth in horses and sheep; thirtieth in square miles. Pennsylvania ranks next to New York in wealth, population, and manufactures. Industries: The people are largely engaged in agriculture, mining, and manufactures; wheat, corn, orchard fruits, potatoes, butter, and wool, are the chief products. The farms are generally large and well conducted. The manufactures are very extensive, and comprise a great variety of articles: iron, cotton, and woollen goods being the leading articles. In the production of coal and iron Pennsylvania surpasses all other states.

Pharsalia, Battle of, where Pompey was defeated by Cesar, B. C. 47.

Philippi, Battle of, which terminated the Roman Republic, B. C. 41.

Phoenicians, by order of Pharaoh Necho, sailed from the Red Sea, round Africa, and returned by the Mediterranean, B. C. 607.

Picts. First mentioned in history 296; kingdom of, began in Scotland, 823. They built a wall between England and Scotland known as the Picts' wall.

Plague. Almost the whole world visited by one, B. C. 767; in Rome, which carried off 10,000 persons in a day, 80 A. D.; in England, that carried off 84,000, in 772; in Scotland, wherein 40,000 died, 964; in England, 1247; again, 1347; in Germany, which cut off 90,000 people, 1345; in Paris and England, where 57,000 died in England, 1362; again in England, 80,000 killed in London, 1407; at Constantinople, when 200,000 persons died, 1611; at Lyons,

where 60,000 died, 1682; again at London, where 68,000 were destroyed, 1665; at Marseilles, fatal to 60,000 persons, 1773; at Bassora, in Persia, when 80,000 persons died, 1778.

Poet Laureate. The first mention of one is in the reign of Edward IV., though the present office under this title is derived from the "King's Versifier," of whom we hear in 1251.

Poictiers, Battle of, between the French and English, in which the former were defeated, September 19, 1356.

Poland, made a duchy, 550; kingdom of began, under Boleslaus, 992; Pomerania united with it, 1465; embraced Christianity, 965; seized and divided between Russia, Prussia, and Austria, 1772; its partition was rearranged, 1815; revolution commenced at Warsaw, November 29, 1830.

Pope, Title of, formerly given to all bishops; but Boniface III., 606, influenced the emperor Phocas to confine it to the Bishops of Rome; Hygenus was the first Bishop of Rome that took the title, 138; pope's supremacy over the Christian church, first established by Boniface III., 607; John XIX., a layman, made pope, 1024; first pope that kept an army was Leo VII., 1048; Pope Gregory obliged Henry IV., emperor of Germany, to stand three days, in the depth of winter, barefooted, at his castle gate, to implore his pardon, 1077; the pope's authority first introduced into England, 1079; abrogated by Parliament, 1534; the word pope struck out of all English books, 1541.

Portugal, formerly called Lusitania, with the rest of Spain, subject to the Moors, 713; held by the Moors until the end of the eleventh century; Portuguese monarchy established, 1139; first conquest abroad made in 1415, upon the discovery of the Island of Madeira; in 1500 Brazil was discovered by Cabral, which was followed by the establishment of a colony; taken by the Spaniards, 1580; revolted from Spain, and the Duke of Braganza sat on the throne under Philip IV. of Spain, and the III. of Portugal, 1640; in the latter year, the Duke of Braganza expelled the Spaniards, and ascended the throne under the title of John IV.; invaded by France in 1807, when the royal family went to Brazil; from 1827 to 1833 the throne was usurped by Don Miguel. The erection of Brazil into an independent empire, 1822-1825, robbed Portugal of her richest possession.

Post, method of carrying letters established by Louis XI. of France about 1470; general post office, established in England, as now known, 1660.

Potatoes. First introduced into England from America by Sir Francis Drake, 1586; introduced into Ireland, 1610.

Protestants. Name of, began from the Diet of Spire, when several of the German states protested against a decree of the Diet to support the doctrine of the Church of Rome, 1529.

Prussia, anciently possessed by the Venedi, B. C. 320; the Venedi were conquered by Borussii who inhabited the Rhiphean Mountains; whence the country was called Borussia or Prussia, which was subdued by the Teutonic knights, sent by the Emperor Frederick II., 1238; revolted to Jagello, King of Poland, 1219; the grand master of the Teutonic order conquered the Poles and kept possession till 1701, when he was made a king.

Public Houses, power of licensing them, first granted to Sir Giles Mompesson and Sir Francis Michel, 1621.

Punic Wars, First, began B. C. 264, lasted twenty-three years; second, began 218, and ended 200; third, began 149.

Quakers, founded by George Fox, 1646; fifty-five transported from England to America by order of Council, 1664; their affirmation adopted by Act of Parliament for an oath, 1696.

Quebec, a province of Canada, was originally settled by the French, and the present population is largely composed of descendants of the Voyagers. The capital, Quebec, is the oldest city in the Dominion. Its fortifications were at one time considered next to Gibraltar, the strongest in the world. Nevertheless, the fortress was captured by General Wolfe; taken by the English, September 13, 1759; unsuccessful attack on, by the Americans, under General Montgomery, December 31, 1775. The metropolis, Montreal, is noted for its churches. There are manufactures of iron castings, machinery, cutlery, nalla, leather, musical instruments, boots and shoes, paper, India rubber goods, tobacco, and steel. The staples of export are lumber, beef, and dairy products. Quebec was first visited by Jacques Cartier in 1535. It then consisted of an Indian village called Stadacona. In July, 1608, Champlain founded the city, giving it its present name.

Referendum. Since 1874 a feature of the government of Switzerland. The Constitution provides that upon demand of 8 cantons or 80,000 citizens any Federal law of general application must be submitted to the people.

Revolution, in Great Britain, took place through the Prince of Orange landing in England with 15,000 men to take possession of the throne, November 5, 1688; in France, began 1789; in the United States, July 4, 1776; in Sweden, in 1772; second French Revolution, July, 1830.

Rhodes. An island of the Turks, peopled from Crete, B. C., 916; the city built, 408; taken by the Saracens and the Colossus sold, 653; taken from the Turks, 1309; retaken by them from the Knights of Jerusalem, 1522; almost destroyed by an inundation B. C. 814; Hipparchus began his astronomical observations here, 167.

Rhode Island. First settlement made by the English at Providence, 1636. Ranks second in cotton, flax, and linen goods; twentieth in wealth. The state is largely engaged in manufacturing. It has considerable commerce. Farming is carried on to some extent; the chief productions are grain, fruit, butter, and cheese.

Romans. First engaged in naval affairs and defeated the Carthaginians, B. C. 260; first crossed the Po, pursuing the Gauls, who had entered Italy, 225; defeated by Hannibal at Cannæ, 216; commenced the auxiliary war against Philip II. in Epirus, which was continued at intervals, 213; subdued Macedonia and Sparta, 197; defeated Antiochus at Thermopylae, 191; made war against the Achæans, 147; destroyed Carthage, 146; 80,000 defeated on the banks of the Rhone by the Cimbrî and Teutones, 105; Cyrene left them by Ptolemy Apion, 97; first invaded England, B. C. 54; quitted Britain, A. D. 410.

Rome, republican government established B. C. 509; first alliance between Rome and Carthage, 508; burned by the Gauls, 390; first coining of silver, 269; surgery introduced, 219; Asiatic luxury first introduced by the army, from the spoils of Antiochus, 190; first library created with books obtained from Macedonia, 168; philosophers and rhetoricians banished, 161; sumptuary law, limiting the expenses of eating and drinking, B. C. 181; set on fire by Nero, A. D. 64; Capitol and Pantheon destroyed by fire, 80.

Russia, anciently Sarmatia, was inhabited by the Scythians; came into renown in 864, when the natives attempted to take Constantinople. The foundation of the Russian empire was laid by the Rus or Varangians, a body of Scandinavians led by Rurik, at Novgorod, about 862; in the twelfth, thirteenth, and fourteenth centuries, Russia was tributary to the Mongols; the country was consolidated and extended under Ivan the Great, and Ivan the Terrible, 1462-1584. Peter the Great was the most distinguished ruler of Russia, 1672-1725. Important events of more recent times were: The dismemberment of Poland, of which the greater part became Russian, 1772; the wars of Napoleon and the burning of Moscow, 1812; the Crimean War, 1853-55; the vast increase in area by war and treaty of the Asiatic provinces, 1858-73; the abolition of serfdom, 1863; the sale of Alaska to the United States, 1867; the Turko-Russian war, 1877-78; the war between Russia and Japan, 1904-06.

Rubicon, The, is a river of Italy flowing into the Adriatic, which formed the boundary between Cisalpine Gaul and Italy proper. The passage of this river by Julius Cæsar was necessarily the signal for civil war, the issue of which could not be foreseen, as Roman generals were forbidden to cross this river at the head of an army.

Rye House Plot, a plot to assassinate Charles II. at a place called Rye House on his way to Newmarket, was prevented by the king's house at Newmarket accidentally taking fire, which hastened his departure eight days before the plot was to take place; discovered June 12, 1683.

Sacred War, first, concerning the temple of Delphi, B. C. 595; second war, between Phocians and Delphians for the Delphic temple, 448; third war, on Delphi being attacked by the Phocians, 356; war finished by Philip taking all the cities of the Phocians, 348.

St. Helena, first taken possession of by the English, 1600; Charles II. gave it to the English East India Company in 1673; celebrated as the place of exile of Napoleon Bonaparte, 1815, where he died May 5, 1821.

Saints, tutelar, St. George of England, St. Andrew of Scotland, St. Patrick of Ireland, St. David of Wales, St. Dennis of France, St. James of Spain.

Saracens, conquered Spain, 711, empire of, ended by the taking of Bagdad by the Tartars, 1258.

Sardinia, given to Spain by the Pope, 1296, in whose possession it continued until 1708, when it was taken by an English fleet and given to the Elector of Bavaria. He transferred it to Austria, which country, in 1720, gave it to the Duke of Savoy in exchange for Sicily.

Savoy, Part of Gallia, Narbonensis, submitted to the Romans, B.C. 118; the Alemanni seized it in 395; the Franks, 490; it shared the revolutions of Switzerland till 1048, when Conrad, Emperor of Germany, gave it to Humbert with the title of count; erected into a duchy, 1416.

Sabines, The, were an important tribe of ancient Italy, allied to the Latins, Samnites, etc. Famous in Roman history as the people whose daughters were treacherously seized by the Romans at the Consualia or games in honor of the god Consus. A treaty of peace was concluded with the Sabines, 750 B.C. After frequent wars, the Sabines were finally defeated, 290 B.C., by M. Curius Dentatus, and were incorporated with Rome in the third century B.C.

Salle Law, The, was the code of the Sallian Franks, introduced into France (Gaul) by the Franks. It contained four hundred articles, chiefly concerning debt, theft, murder, and battery, the penalty in every case being a fine. The most famous article of the code is Title lxi.6, according to which only males could succeed to the Salle land or *lod*, i. e. to the lands given for military service. In 1316, at the death of Louis le Hutin, the law was extended to the crown and continued to be observed to the end of the monarchy.

San Marino, in Italy, on the coast of the Adriatic Sea, is the oldest republic in the world. It is, next to Monaco, the smallest state in Europe. The exact date of the establishment of this republic is not known, but according to tradition it was in the fifth century, by Marinus, a Dalmatian hermit, and has ever since remained independent. It is mountainous and contains four or five villages. The word "liberty" is inscribed on its Capitol.

St. James's Palace is a large, inelegant brick structure, fronting towards Pall Mall. Originally a hospital dedicated to St. James, it was reconstructed and made a manor by Henry VIII., who also annexed to it a park. Here Queen Mary died, 1558; Charles I. slept here the night before his execution; and here Charles II., the Old Pretender, and George IV. were born. When Whitehall was burned, in 1698, St. James became the regular London residence of the British sovereigns, and it continued to be so till Queen Victoria's time. The Court of St. James is a frequent designation of the British Court. St. James Park lies southward from the Palace, and extends over fifty-eight acres.

Saxons, The ancient, were pirates, and inhabited three small islands at the mouth of the Elbe, and some part of the shores of the Baltic; were invited to England, A.D. 449, by the Britons.

Scotland, anciently Caledonia. In A.D. 502 Fergus I. was sent over by the people of Ireland; united under one monarchy by Kenneth II. in 843; divided into baronies, 1004; it began to be known as Scotland in the 10th century; invaded by the King of Norway, near Loch Lomond, 1263; on the death of Alexander III. was disputed by twelve candidates, who submitted their claims to the arbitration of Edward I. of England, 1290, which gave him an opportunity to conquer it; recovered by the Scots, 1314; first General Assembly of the church held, December 20, 1560; united with England under the reign of James VI. of Scotland and James I. of England. The Scottish crown was united with that of England in 1603, while the legislative union of the two countries was formed in 1707.

Scilly, First colonized from Italy, B.C. 1294; usurped by Agathocles, 317; Servile war began and continued three years, 135.

Slave Trade, Abolition of, in England proposed in Parliament, 1787; abolished, 1807; abolished by France, 1815; Spain, 1817; and Holland, 1814; treaty concluded between Great Britain and Brazil for the abolition of, 1826. The importation of slaves into the United States prohibited after January 1, 1808; emancipation proclamation issued, 1863.

Smyrna, built by the people of Cumæ, B.C. 1060; destroyed by an earthquake, 1040, A.D., and again 1698; the chief commercial emporium of West Asia.

South Carolina (Palmetto State). First settlers, English, Ashley river, 1670. Ranks first in phosphates and rice; fifth in cotton; twentieth in population; twenty-eighth in miles of railway; thirtieth in wealth; thirty-seventh in square miles. Agriculture is the principal industry, the state producing a larger amount of

rice than any other state. "Sea Island Cotton" is of the finest quality, and superior to all other, and is raised on several islands along the coast of this state, and Georgia. Corn, oats, wheat, sweet potatoes, and tobacco, are extensively raised. The export of rice and cotton is large. But few manufactures are as yet established in the state, though considerable attention is being given to them.

Spain, First civilized by the Phenicians; conquered by the Romans, B.C. 207; the Goths and Vandals overturned the Roman power, 409, and continued in possession of the country till it was conquered by the Moors in 711; the Moors kept possession till the small kingdoms were swallowed up in Castile and Aragon; kingdom founded by the union of the two crowns of Castile and Aragon, 1479; the king and princes of the House of Bourbon ceded their claims to the throne of Spain in 1808; Joseph Bonaparte became king in the same year; Ferdinand's rule was shortly afterwards re-established, but was marked by serious insurrections; he was succeeded by his daughter Isabella II., who was forced to abdicate in 1868; in 1876 a constitution was proclaimed, providing that the government shall be a constitutional monarchy. War was declared against Spain by the United States in April, 1898.

Sparta, built by Lacedæmon, B.C. 1490; kingdom of, commenced under Euristhenes and Procles, B.C. 1102; ephori established at, 760.

Straits of Habelmandeb, The, the passage from the Persian Gulf into the Red Sea, are called the Gate of Tears by the Arabs. The channel is only about twenty miles wide, is rocky and very dangerous for passage in rough weather. It received its melancholy name from the number of shipwrecks that occurred there. In it is the small island of Perim, which belongs to Great Britain, and is used as a coaling station.

Surnames, first used among the nobility, 1200; many of the most common were taken by the Flemings who were naturalized in England about 1435.

Sweden, united to the crown of Denmark and Norway from 1397 to 1523, when Gustavus Vasa expelled the Danes; Christianity introduced there, 829; popery abolished there in 1527 and the crown declared hereditary, 1544; the house of Vasa ascended the throne in 1523, and gave to Sweden the great Gustavus Adolphus; it was succeeded by the House of Deux-Points, which furnished the famous Charles XII.; in 1810 Marshal Bernadotte of France was chosen Crown Prince and ascended the throne as Charles John XIV. in 1818; the union with Norway took place in 1814. It was separated from Norway in 1905.

Switzerland, inhabited formerly by the Helvetii, who were subdued by Cæsar, B.C. 57; became part of the kingdom of Burgundy, 883; the confederation was founded November 4, 1307; in 1802 Napoleon I. organized a new confederation composed of 19 cantons; this confederation was modified in 1815, the number of cantons being increased to 22; a new constitution was adopted in 1848.

Tarpeian Rock, The, was so called from Tarpela, daughter of Spurius Tarpelus, governor of the citadel, on the Saturnian Hill of Rome. The story is that the Sabines bargained with the Roman maid to open the gates to them for the "ornaments on their arms." As they passed through the gates, they threw on her their shields saying, "These are the ornaments we bear on our arms." She was crushed to death, and buried on the Tarpeian Hill. Ever after, traitors were put to death by being hurled headlong from the hilltop.

Tarquin, The last king of Rome, expelled B.C. 509.

Tartary, The first ruler was Genghis Khan, 1206, whose descendants held the empire until 1582, when the Mongols revolted to the Manchu Tartars in China; the Eluths became a separate state about 1400.

Taxes, Originated from those levied by Solon at Athens, B.C. 594; the first paid in money in England were in 1067.

Tea, First brought into Europe by the Dutch East India Company, early in the seventeenth century; a quantity of it was brought from Holland by Lord Arlington and Lord Ossory, 1666; from this time it became universal; taxed in North America, 1767; Americans refused to receive it with the duty on, and threw a cargo of it into the sea at Boston, 1773.

Texas (Lone Star State). First settlement by the Spaniards, at San Antonio, 1692. Admitted to the Union, 1845. Ranks first in cattle and cotton and square miles; second in sugar, sheep, mules, and horses; sixth in miles of railway; seventh in milch cows; eighth in rice and hogs; eleventh in population; nineteenth in

wealth. Stock raising is the leading industry, Texas ranking first in this production. Agriculture extensively engages the attention of its inhabitants; corn, wheat, and the other cereals are raised in the northern part; sweet potatoes, sugar cane, tobacco, and tropical fruits in the southern part. Its commerce consists of exports of cotton, hides, and live stock. The state has vast resources that have not, as yet, been fully developed; an abundance of most valuable timber, large deposits of coal, iron, and salt, and other useful minerals.

Teutones. The, were a German tribe, mentioned by Roman writers as inhabiting the northwest part of Germany north of the Elbe. In conjunction with the Cimbri, they invaded Gaul, 118 B. C., destroying two Roman armies, and then proceeded to invade Italy; but the Teutones were defeated and almost annihilated by Marius at Aquas Sextie, 102 B. C., and the Cimbri at Campus Raudius, near Verulles, 101 B. C.

Tennessee, settled at Fort Loudon, 1757, by the English. Agriculture is the most important industry, the staples being wheat, cotton, corn, hemp, and tobacco. In the production of tobacco, the state ranks third. The iron and coal interests are growing rapidly, and will prove one of the richest resources. The marbles of the state are esteemed for their color and variety. Immense numbers of swine and mules are raised in the state. The manufacturing industries are better developed than in any of the other southern central states. A large internal commerce is carried on by means of the rivers and railroads of the state.

Theater, that of Bacchus at Athens, first ever erected, was completed by the Greeks about 540 B. C.; the ruins still exist; plays were opposed by the Puritans, 1642, and suspended till 1860, when Charles II. licensed two companies; till this time boys performed women's parts; Henry Purcell introduced opera, 1680-1690.

Thebes, founded 1571 B. C.; citadel built by Cadmus, 1493; flourished as a republic; 820; destroyed by Alexander, with the slaughter of 120,000 persons, when he left only the house of Pindar, the poet, standing, 835; rebuilt by Cassander, B. C. 315.

Thermopylæ, defended by Leonidas B. C. 480, during the invasion of Xerxes; Romans defeated Antiochus at, 191.

Thrace, a considerable part of ancient Greece annexed to Macedon by Philip and Alexander about 355; conquered by the Romans, 188; Byzantium was its capital, on the ruins of which Constantinople was built; taken by the Turks, 1453.

Tilts and Tournaments, regulated by Henry I. of Germany, 919; forbidden by the Council of Rheims, 1181; in fashion in England in the eleventh and twelfth centuries; abolished in France 1560, Henry II. having been killed in one.

Tithes, first given by Moses to the tribe of Levi, B. C. 1490; established in France under Charlemagne; established by law by the Lateran Council, 1215.

Tobacco Plant, used by the Spaniards in the peninsula of Yucatan, 1520; introduced into France by Nicot, 1560; first brought into England by Francis Drake, 1586.

Toulouse, France, founded about B. C. 615; a dreadful tribunal established there to extirpate heretics, 1229; dissolved 1242; the troubadours or rhetoricians of, had their origin about 1150, and consisted of a fraternity of poets whose art was extended throughout Europe and gave rise to the Italian and Spanish poetry.

Trojan War, commenced B. C. 1198. The kingdom of Troy began by Scamander, from Crete, B. C. 1546; city built, B. C. 1256; burned, B. C. 1184, when an end was put to the kingdom.

Tunis and Tripoli, formerly the republic of Carthage. Carthage stood nearly where Tunis now stands. The former was besieged by Louis IX. of France, 1270; it remained under African kings till taken by Barbarossa under Solymán the Magnificent; Barbarossa was expelled by Charles V. but the country was recovered by the Turks, under Selim II., since which it has been tributary to the Grand Seigneur; it has long been a dependency of Turkey.

Turkish Empire. At the end of the thirteenth century, Othman established the present empire in Asia Minor; in the fourteenth century they invaded Europe and in 1453 took Constantinople; the capture of Constantinople was followed by other important conquests, among which were Greece and Arabia; the glory of the empire culminated in the reign of Solymán the Magnificent, 1520-1566; after his death began the decline of the Ottoman empire; Austria expelled them from Hungary, Russia deprived them of the provinces between the

mouths of the Danube and the Caucasus in Europe, and those forming western Trans-Caucasian Asia; the Greeks formed an independent state; Algiers was wrested from them by the French; the power of the Porte has nearly vanished from the provinces of Asia Minor, Arabia, and Egypt, and finally the Russo-Turkish war of 1877-1878 has deprived the Porte of much of the territory in Europe.

Tuileries. The, is the name of a garden and palace in Paris, built on the site of an ancient *fabrique de tuiles*. It was composed of three great pavilions, called the *pavillon de Marsan* (north), the *pavillon de Fière* (south), and the *pavillon de l'Horloge* (center). It was joined to the Louvre by Napoleon III. (1861-6). The land was bought by François I. in 1544, and the original palace was made for Catherine de' Medici after the design of Philibert Delorme.

Tuscany, the ancient seat of the Etruscans, belonged to Germany till 1240.

Tyre, a city of great antiquity, suffered destruction at an early period; rebuilt under Nimus; taken by Nebuchadnezzar after a siege of thirteen years; it became subject to the Romans, B. C. 64.

Utah was first settled by Americans at Salt Lake City, 1847. Organized as a territory, 1850; admitted as a state, 1896. Ranks third in silver; tenth in gold; fifteenth in coal.

Valencia, conquered by the Moors under Abdallah Ciz, and lost by them, 1094; relinquished to the Moors again by the king of Castile; soon after taken again by James I. of Aragon, 1288, and with Aragon united with Castile, 1479; capitulated to the French, January 9, 1812.

Vandals. The, inhabited Germany and embraced Christianity, 400; began their kingdom in Spain, 411; invaded and conquered the Roman territories in Africa under Genserich, 480; sacked and pillaged Rome, 455.

Varangians. The, were the Norse vikings, who, in the ninth century laid the foundations of the Russian empire. Many of them entered the service of the Byzantine emperors, and in the days of the Comneni the Varangians regularly formed the imperial bodyguard at Constantinople. The Varangians at Constantinople were largely recruited by Anglo-Saxons and Danes from England after the Norman Conquest.

"Vaticanus Mons" is a hill at Rome, chiefly noted for its magnificent palace of the popes, the Vatican, with its superb gardens, its museums, celebrated library, and basilica of St. Peter. The palace was constructed in 498, but has often been enlarged.

Vermont (Green Mountain State). First settled by the English, Fort Dummer, 1764. Ranks fourth in copper; seventh in hops and buckwheat; twenty-sixth in wealth; thirty-second in population; fortieth in square miles; forty-first in miles of railway. The state is noted for its rich quarries of marble, soapstone, and slate, which are worked at several points. It is also noted as a good grazing country. The dairy products are extensive and valuable. Stock raising is carried on to a considerable extent.

Vendôme Column. The, in Paris was erected by Napoleon I. 1806, in the Place Vendôme, to commemorate his successful campaign in Germany; pulled down by the Communists, 1871, but restored by the National Assembly, 1874. It is one hundred and thirty-two feet high, with a statue of Napoleon I. at the top.

Venice. Originally inhabited by the Veneti; conquered by the Gauls and made a kingdom about B. C. 356; conquered for the Romans by Marcellus, 221. The islands on which the city now stands began to be inhabited by Italians about 421; its university founded, 1592.

Vesuvius, eruptions of, A. D. 79, 208, 472; ejected flames that were seen at Constantinople; obscured the sun at noonday, and ravaged all Campania; was in an active state of eruption upward of 85 times, between the year 472 and the present.

Vienna, the capital of Austria-Hungary, was originally Vindobona of Upper Pannonia; afterwards capital of the east provinces of the empire of Charlemagne; besieged by the Turks in 1529, and again in 1683; the French took it in 1805 and in 1809; the Congress of Vienna, which fixed for a time the limits of the countries of continental Europe, was held here November, 1814, to June, 1815.

Vikings. The, were the practical Northmen who infested the coasts of the British Islands and of France in the eighth, ninth, and tenth centuries. This word is quite unconnected with "king," being derived from the Scandinavian *vik*, "a bay" (the same which appears

in the names Lerwick, Berwick, etc.), and this class of marauders were so called because their ships put off from the bays and fjords.

Visigoths. The, or Western Goths, were the descendants of that branch of the Gothic race established by Aurelian in Dacia, 270. The descendants of the other branch of the race, which remained in Southern Russia, were called Ostrogoths (Eastern Goths). On the death of Theodosius, the Visigoths, under Alaric, overran Greece, 396, and took Rome, 410. After Alaric's death, 410, they established a kingdom at Toulouse, 414, which eventually comprised the whole of Gaul south of the Loire and west of the Rhone, as well as Provence and the greater part of Spain. With the defeat (and death) of Alaric II. by Clovis, on the field of Vouillé (or Vouille or Voelad) near Poitiers, 507, the kingdom of Toulouse came to an end, and the Visigoths abandoned to the conqueror all their territories north of the Pyrenees, with the exception of a small tract of country in Gaul, including the cities of Carcassonne, Narbonne, and Nîmes.

Virginia. first settled at Jamestown by the English, 1607. Ranks first in peanuts; second in tobacco; eighth in salt and iron ore; sixteenth in wealth. Agriculture is the leading industry; tobacco, wheat, corn, and potatoes being the great staples. The mineral resources are vast; the mountains containing rich deposits of coal and iron, valuable marble, slate, and stone quarries with important salt springs.

Wales. The first king was Edwawl, 690; it was conquered and divided by William II., 1090; Griffith, the last king, died 1137; the sovereign from that time forward was the prince; completely conquered and annexed to the crown of England, 1281.

Walloons. The, are the inhabitants of the southeastern division of Belgium, their country comprising the provinces of Hainaut, Namur, Liège, and Luxembourg, with part of Brabant. The Walloons are Romanized Gauls, lineal representatives of the ancient Belgæ, distinguished from their Flemish (Teutonic) neighbors by their Romance language, their stronger physique, and their darker complexion. The Walloon language, however, a strongly marked dialect of Northern France (the *Langue d'Oïl*), is now merely a provincial *patois*, French being the written standard and official language of the whole kingdom.

Washington ranks eighth in gold, seventeenth in square miles, forty-first in population, forty-second in miles of railway. Population, according to territorial census in 1885, 127,292; United States Census, 1890, 349,390. First settlement, by Americans, at Astoria, 1811. Organized as a territory, 1853. Admitted to the Union, 1889.

Wat Tyler's insurrection. a peasants' revolt, immediately due to the imposition of a poll tax on all persons above fifteen. Almost the whole of the peasantry of the southern and eastern counties of England rose in arms, murdering and plundering, under the leadership of Wat Tyler, said to have been a soldier in the French wars. On June 12, 1881, they gathered on Blackheath. On June 14, Richard II., then a lad of fifteen, met the Essex contingent at Mile End, and promised them the abolition of villanage. On June 15, he met the Kentish men at Smithfield, and Wat Tyler was lured out of sight of his men and killed by William Walworth, mayor of London, and

others. The peasants were induced to go to St. John's field, where a body of troops coming to the king's aid, and Richard being profuse of promises, they dispersed.

Waterloo. Napoleon, about eleven o'clock, June 18, 1815, with 72,000 men attacked a combined army of 68,000 English, Dutch, Belgian, and Hanoverian troops. Bülow, with the Fourth Prussian Corps, arrived near Napoleon's right about three in the afternoon, and 10,000 French troops were detached to hold him in check. The battle raged until 7.30, when about 82,000 of Blücher's Prussians, under Ziethen, began to arrive on the field. They turned the French right wing, and by 9.30 p. m., the whole French army was fleeing in confusion. The French loss in killed, wounded, and missing was 81,000, that of the allies, 22,000.

West Virginia. The first settlers were English, Wheeling, 1774. Agriculture is the leading industry, and the principal staples are tobacco, wheat, and corn. The mountain pastures are well adapted to stock raising. Its mineral resources are rich deposits of coal, iron, and numerous oil wells and salt springs.

Westminster Abbey, built by Sebert, king of Essex, on the spot where the Temple of Apollo had once stood; its monastery consecrated by Edward the Confessor, 1065; rebuilt and consecrated, 1299; turned into a collegiate church, 1560.

Wills are of a very high antiquity; Solon introduced them at Athens; there are many regulations respecting wills in the Koran; the Roman had this power; so had the native Mexican, so that it prevailed at least in three parts of the globe; lands were devisable by will before the Conquest; privilege of making wills granted by Henry I. of England in 1100.

Wisconsin (Badger State). First settlement, by the French, Green Bay, 1680. Admitted to the Union, 1848. Ranks second in hops; third in barley and potatoes; fourth in rye and buckwheat; fifth in oats and agricultural implements; seventh in iron, steel, and wool; eighth in hay and milch cows; ninth in copper; tenth in wealth; eleventh in miles of railway; sixteenth in population, and twenty-third in square miles. The chief industry is agriculture, with large crops of corn, wheat, oats, barley, hay, potatoes, and hops as the staple productions. Live stock is largely raised. In the production of wool and cheese it is among the leading states. The manufacturing interests are large and increasing. The great pine forests in abundance, and the most valuable timber, lead, iron, zinc, and marble mines are extensively worked. Lakes Michigan and Superior, and the Mississippi, afford great natural highways for commerce.

Witchcraft. Six hundred condemned as wizards, and most of them burned in France, 1609; Grandier, parish priest of Loudun, burned on the supposition of having bewitched a whole convent of nuns, 1634; nine old women were burned at Kalish, in Poland, charged with having bewitched and rendered unfruitful the lands belonging to a gentleman in that palatinate; the last punished in England, for witchcraft, was October 29, 1808.

Wyoming. Ranks ninth in square miles; twelfth in cattle; fourteenth in gold; sixteenth in coal; forty-fourth in miles of railway; forty-sixth in population. First settlement by Americans, 1807. Organized as a territory, 1868. Admitted to the Union in 1890.

HISTORIC TREATIES.

843. Contract of Verdun. This treaty concluded the war between Lothar, Louis the German, and Charles the Bald, over their respective shares of the imperial dominions on the death of their father, Louis the Pious.

911. Treaty of St.-Clair-sur-Epte: concluded the war between the invading Norsemen under Rollo and the French king, Charles the Simple.

1122. Concordat of Worms: an agreement between the emperor and the pope, closing the long strife known as the war of investitures.

1183. Treaty of Constance: between the emperor, Frederick Barbarossa, and the Lombard cities.

1360. Peace of Bretigny: a treaty that interrupted the Hundred Years' war between France and England.

1397. Union of Calmar: the treaty by which Denmark, Sweden, and Norway were united under Queen Margaret of Denmark.

1420. Treaty of Troyes: interrupted the Hundred Years' war on terms most favorable to England.

1436. Treaty of Arras: a compact between Burgundy and France.

1466. Treaty of Thorn: settled the terms of the Polish conquest of West Prussia.

1482. Treaty of Arras: settled the dispute between Louis XI. of France, and Maximilian of Austria.

1493. Bull of Pope Alexander VI.: arranged the conflicting claims of Spain and Portugal to newly discovered lands.

1508. League of Cambray: a union formed by Louis XII. of France and the Emperor Maximilian, which the pope and others were invited to join.

1526. Treaty of Madrid: formed between Charles V. of Germany and Francis I. of France.

1529. Treaty of Cambray: between Francis I. and Charles V.

1544. Treaty of Crespy: concluded the fourth and last war between Francis I. and Charles V.

1579. Union of Utrecht: laid the foundations of the Dutch Republic.

1648. Peace of Westphalia: concluded the Thirty Years' War.

1659. Peace of the Pyrenees: closed the long war between France and Spain.

1660. Treaty of Copenhagen: between Denmark and Sweden.
1667. Treaty of Breda: between England and Holland.
1668. Triple Alliance: between England, Holland, and Sweden to defend Spain against Louis XIV.
1668. Treaty of Aix-la-Chapelle: between France and Spain.
1668. Treaty of Lisbon: between Spain and Portugal through the mediation of England.
1678. Peace of Nymwegen: ended the Dutch war.
1697. Peace of Ryswick: closed the war between France under Louis XIV. and the principal states of Europe — called the War of the Palatinate.
1699. Peace of Carlowitz: between Turkey on the one hand and the Emperor of Germany, the King of Poland, and the republic of Venice on the other.
- 1713-14. Treaties of Utrecht, Rastadt, and Baden: concluded between the states taking part in the war of the Spanish succession.
1717. Triple Alliance: between Great Britain, France, and Holland.
- 1718-19. Quadruple Alliance: between Great Britain, France, Holland, and the emperor against the aggressions of Spain.
1718. Peace of Passarowitz: between the sultan and emperor.
1721. Peace of Nystadt: between Sweden and Russia.
1738. Treaty of Vienna: between France and Germany.
1742. Peace of Breslau: between Frederick II. of Prussia and Maria Theresa of Austria.
1748. Peace of Aix-la-Chapelle: between Great Britain, France, and Holland; Austria, Spain, Sardinia, Genoa, and Modena being accessories.
1761. The Family Compact: between the Bourbon rulers of France and Spain.
1763. Peace of Paris: terminated the Seven Years' war, known in United States history as the French and Indian war.
1772. First Partition of Poland: executed by Russia, Austria, and Prussia.
1774. Peace of Kutchuk-Kainardji: between Russia and Turkey.
1783. Treaty of Paris: in which Great Britain acknowledged the independence of the North American colonies.
1783. Treaty of Versailles: between Great Britain, France, and Spain.
1792. First Coalition against France: involved all the powers except Sweden, Switzerland, Denmark, Tuscany, Venice, and Genoa.
1795. Peace of Basel: between France and Prussia.
1795. Jay Treaty: between the United States and Great Britain.
1797. Treaty of Tolentino: between the French republic and the pope.
1797. Treaty of Campo Formio: between Napoleon and the emperor of Germany.
1798. Second Coalition against France: initiated by Russia; afterward comprised England, Austria, Naples, Portugal, and Turkey.
1802. Peace of Amiens: between Great Britain on the one hand, and France, Spain, and the Batavian republic on the other.
1803. Treaty between France and the United States touching the purchase of Louisiana.
1805. Peace of Pressburg: between Austria and France.
1807. Treaties of Tilsit: concluded between France, Prussia, and Russia.
1809. Treaty of Schönbrunn: between France and Austria.
1814. First Peace of Paris: between France and the principal European powers; after the defeat of Napoleon at Leipzig.
1814. Treaty of Ghent: between the United States and Great Britain.
1815. Congress of Vienna: attended by the principal European powers.
1815. Second Peace of Paris: between France and the allies after the defeat of Napoleon at Waterloo.
1815. Holy Alliance: formed at Paris between the monarchs of Russia, Austria, and Prussia.
1818. Congress of Aix-la-Chapelle: participated in by Great Britain, Russia, Prussia, and France.
1827. Treaty of London: between Great Britain, Russia, and France, to put an end to the war between Turkey and Greece.
1829. Treaty of Adrianople: between Russia and Turkey.
1840. Quadruple Treaty of London: between Great Britain, Austria, Prussia, and Russia on the one hand and Turkey on the other, touching Mehemet Ali of Egypt.
1842. Treaty of Nanking: concluded the so-called opium war between Great Britain and China.
1842. Ashburton Treaty: signed at Washington to define the northeastern boundary between the United States and British North America.
1848. Treaty of Guadalupe Hidalgo: between the United States and Mexico.
1854. Treaty between the United States and Japan: negotiated by Commodore Perry.
1856. Treaty of Paris: after the Crimean war.
1858. Treaties of Tientsin: between China and each of the four nations, Great Britain, France, Russia, and United States.
1859. Peace of Zurich: settled the dispute between France and Sardinia on the one hand and Austria on the other.
1864. Peace of Vienna: concluded the war between Austria, Prussia, and Denmark, growing out of the Schleswig-Holstein question.
1865. Convention of Gastein: a compact between Prussia and Austria.
1866. Peace of Prague: concluded the war between Prussia and Austria.
1871. Treaty of Frankfurt: between France and Germany.
1871. Treaty of Washington: to adjust the Alabama claims.
1878. Treaty of San Stefano supplemented by the Congress of Berlin: closed the Russo-Turkish war.
1879. Triple Alliance: between Austria, Germany, and Italy.
1895. Treaty of Shimonoseki: concluded the war between China and Japan.
1898. Treaty of Paris: concluded the Spanish-American war.

Book IV.

Science, Invention, Discovery.

Science, *Invention*, *Discovery*.

Alcoholic Drinks.—The number of alcoholic drinks is surprisingly large and varied. The following are the principal: *Agua ardiente*, made in Mexico, from the fermented juice of agave; *arrack*, made in India from the juice of the palm and from rice; *araka*, made in Tartary, from fermented mare's milk; *araki*, made in Egypt from dates; *brandy*, made in nearly all wine countries from wine and from fruits; *Geneva* or *Holland gin*, made in Holland from malted barley or rye, rectified on juniper berries; *gin* made in England from malted barley, rye, or potatoes, and rectified with turpentine; *goldwasser*, made at Dantzic from various kinds of corn and rectified with spices; *kirchwasser*, made in Switzerland from the *Mahaleb* cherry; *lau*, made in Siam from rice; *maraschino*, made in Dalmatia from the *Macarska* cherry; *Mahwah arrack*, made in India from the flowers of the *madhuca* tree; *rum*, made in the West Indies and South America from cane sugar and molasses; *rakia*, made in Dalmatia from the husks of grapes, mixed with aromatics; *rossolio*, made at Dantzic from a compound of brandy with certain plants; *slatkai-trava*, made at *Kamtschatka* from a sweet grass; *show-choo*, made in China from the lees of rice wine; *trosta*, made in the Rhenish provinces from the husks of grapes fermented with barley and rye; *tuba*, made in the Philippine Islands from palm wine; *vino mescal*, made in Mexico by distilling the fermented juice of the agave; *whisky*, made in Scotland, Ireland and United States from raw and malted grain, and south of France from sloes.

Air.—The gaseous envelope of the earth is composed of oxygen and nitrogen in the ratio of 21 to 79 respectively; a small percentage of watery vapor and carbonic acid gas, and a trace of other gases. Our planet has two coverings. The first, a partial one, is the water, distributed as lakes and seas. The second covering is the air or atmosphere, rising upwards to an altitude somewhat above thirty-five miles; it is a true, aeriform ocean surrounding our earth and has upon its upper surface waves and tides, and, throughout its mass, currents flowing in constant and variable directions, precisely as those of the ocean comport themselves; it is held down to the surface of the earth by attraction, and rotates with the planet; its density varies with its actual height at the place of observation, of which the barometric pressure is the evidence. This pressure diminishes as the

elevation above the sea increases, owing to the upper portions of the atmosphere pressing upon and condensing the lower strata. One half the actual weight of the atmosphere is comprised within the space of the lower five miles of its total height, the remaining thirty miles in height containing the other half. The air is highly compressible and elastic, and its volume diminishes inversely as the pressure increases. This accounts for the facility of setting it in motion and its velocity. Like fluids, it presses equally in every direction, and when it comes in contact with a more expanded and therefore lighter portion of air, it pushes it up and occupies its place, producing currents of air and winds when 't flows in streams, and sounds when it is thrown into vibrations or undulations. The air absorbs heat from both the earth and the sun and moderates extremes of temperature day and night and summer and winter. It absorbs about 40% of the heat of a sunbeam when the sun is at zenith.

Acoustics.—The doctrine of the different sounds of vibrating strings, and the communication of sounds to the ear by the vibration of the atmosphere, was probably first explained by *Pythagoras*, about 500 B. C. Mentioned by *Aristotle*, 330 B. C. The speaking trumpet is said to have been used by *Alexander the Great*, 335 B. C. The discoveries of *Galileo* were made about 1600 A. D. The velocity of sound was investigated by *Newton* before 1700. *Galileo's* theorem of the harmonic curves was demonstrated by *Dr. Brook Taylor*, in 1714; and further perfected by *D'Alembert*, *Euler*, *Bernoulli*, and *LaGrange*, at various periods of the eighteenth century.

Algebra.—Where *Algebra* was first used, and by whom, is not precisely known. *Diophantus* first wrote upon it, probably about 350 A. D.; he is said to be the inventor. Brought into Spain by the *Saracens*, about 800; and into Italy by *Leonardo of Pisa*, in 1202. The first writer who used algebraical signs was *Stifelius* of *Nuremberg*, in 1544. The introduction of symbols for quantities was by *Francis Vieta*, in 1591, when algebra came into general use. The binomial theorem of *Newton*, the basis of the doctrine of fluxions, and the new analysis, 1665. *Descartes* applied algebra to geometry about 1637.

Almanacs.—The Egyptians computed time by instruments. Log calendars were anciently in use. The word *almanac* is of Saxon origin. *Michael Nostradamus*, the as-

trologer, wrote an almanac in the style of Merlin, 1556. The first published is said to have been by Martin Hykus, at Buda in 1470. The first almanac in England was printed at Oxford, in 1673.

Anatomy.—The human body was studied by Aristotle about 350 B. C., and its structure was made part of the philosophical investigations of Plato and Xenophon; it became a branch of medical education, under Hippocrates about 420 B. C. Erasistratus and Herophilus first dissected the human form, and may be regarded as the fathers of anatomy; it is said that they practiced upon the bodies of living criminals about 300 and 293 B. C. Galen, who died 193 A. D., was a great anatomist. In England the schools were long supplied with bodies unlawfully exhumed from graves; and until 1832 the bodies of executed murderers were ordered for dissection. Pope Boniface VIII. forbade the dissection of dead bodies, 1297. The first anatomical plates, designed by Titian, were employed by Vesalius, about 1538. The discoveries of Harvey were made in 1616. The anatomy of plants was discovered in 1680.

Angling.—The origin of this art is involved in obscurity; allusion was made to it by the Greeks and Romans, and in the most ancient books of the Bible, as *Amos*. It came into general repute in England about the period of the reformation. Winkin de Worde's *Treatyse of Fysshinge*, the first book printed on angling, appeared in 1496. Isaac Walton's book was printed in 1653.

Arithmetic.—Where first invented is not known, at least with certainty. It was brought from Egypt into Greece by Thales, about 600 B. C. The oldest treatise upon arithmetic is by Euclid, about 300 B. C. The sexagesimal arithmetic of Ptolemy was used A. D. 130. Diophantus of Alexandria was the author of thirteen books of arithmetical questions (of which six are extant) in 156. Notation by nine digits and zero, known at least as early as the sixth century in Hindostan—introduced from thence into Arabia, about 900, into Spain 1050, into England 1253. Arithmetic of decimals invented 1482. First work printed in England on arithmetic was by Tonstall, bishop of Durham, 1522. The theory of decimal fractions was perfected by Lord Napier in 1617.

Assaying.—The assaying of silver and gold is affected by a process called cupellation. Cupels are small flat crucibles made by pressing bone ash moistened with water, into circular steel molds, and they are dried by exposure to the air. The principle upon which the operation depends is, that all metals with

which gold and silver are usually alloyed, are convertible into oxides by exposure to atmospheric air at a high temperature, whereas the precious metals remain unacted upon.

To assay silver by cupellation the silver is flattened and wrapped up in an envelope of lead. A muffle or oven is heated in an assay furnace and the two metals put into it. The metals melt and the lead becomes converted into an oxide, which as well as any baser metals before combined with the silver is absorbed by the substance of the cupel until at length the silver is left absolutely pure.

The assaying of gold is performed, to a certain extent in a similar way, and if the gold were alloyed only with copper, the process would be as simple as that of silver assaying. Usually, however, gold contains silver, and this cannot be got rid of by cupellation, the parting process is, therefore, had recourse to; this consists in dissolving the silver by dilute nitric acid, which leaves the gold perfectly pure.

Iron ores are assayed by separating the oxygen from the iron, by the greater affinity of charcoal for that element at high temperatures. The ore, some charcoal, and an alkaline flux are heated in a crucible; and the result is that all the impurities in the ore are made to leave the iron so that the latter is presented in a purely metallic form.

Copper ores usually contain sulphur, and in order to assay them a flux is prepared of fluor spar, borax, slacked lime, argol, and niter.

Automobile.—This name covers all forms of self-propelling vehicles for use on country roads or city streets, whether driven by steam produced by the combustion of fuel, stored steam, compressed air, oil or gasoline engines, or by electric motors taking current from accumulators. Automobiles are not of recent origin, as many generally suppose, but date back to the early days of the steam engine, to the time of Sir Isaac Newton, who, in 1680, proposed a form of steam carriage which embodied the essential features of a steam automobile. In 1790 Nathan Read patented and constructed a model steam carriage. But the first actual experiments were made in 1769, by a French army officer, Nicholas Cugnot, who built a three wheel carriage. In America, Oliver Evans, as early as 1786, suggested a form of road wagon to be propelled by steam. In 1803 Richard Trevithick built a full sized carriage which was exhibited in London, having driven itself 90 miles *en route* from Camborne, where it was constructed. David Gurney built and operated a steam carriage in 1827, in which he made frequent and long journeys, covering as much as 85 miles in 10 hours. He was excelled by Walter Hancock who established

several stage lines. Since 1805 the construction of automobiles has been carried on with great energy, and many improvements have been made. So far the most satisfactory results have been obtained with the steam, oil, and electric carriages. In tire construction the pneumatic tire occupies the first place in public favor, although solid rubber tires are largely employed. The highest speed is obtained by use of light oils, preferably gasoline; steam motors are most successfully used with heavy trucks and vans; the electric motor has given the best satisfaction when employed on vehicles for city cab and carriage work and short radius runs.

Æolian Harp was the invention, it is believed, of Athanasius Kircher, who lived in the seventeenth century, and it is so called from Æolus, the god or ruler of the winds. It is a simple musical instrument, the sounds of which are produced by the vibrations of strings moved by wind. It may be composed of a rectangular box made of thin boards, five or six inches deep and about the same width, and of a length sufficient to extend across the window it is to be set at, so that the breeze coming in can sweep over it. At the top of each end of the box a strip of wood is glued, about a half-inch in height; the strings are then stretched lengthwise across the top of the box, and may be tuned in unison by means of pegs constructed to control their tension, as in the case of a violin. The sounds produced by the rising and falling wind, in passing over the strings, are of a drowsy and lulling character, and have been beautifully described by the poet Thomson as supplying the most suitable kind of music for the *Castle of Indolence*.

Aerial Navigation.—Pilatre des Rosiers made the first balloon ascension at Paris, November 21, 1783. His balloon was inflated with heated air. December 1, 1783, an ascension was made by M. Charles, a professor of Natural Philosophy, at Paris, and at about the same time successful ascensions were also made by Messrs. Rittenhouse and Hopkins, of Philadelphia, hydrogen gas being used in these instances for inflating purposes. The valve at the top of the balloon, and the hoop attached to the balloon with netting, by which is suspended the car, are the inventions of M. Charles. In 1785 a successful passage of the English Channel was made by M. Blanchard, the first professional aeronaut, and an American traveler named Dr. Jeffries. The use of ropes for the purpose of steadying balloons was first adopted by M. Gay-Lussac, in 1803. From 1852 to 1884 French, German, and American aeronauts labored with degrees of success to improve the method of construction

and to invent a means for the propulsion of balloons, and in the latter year Captains Renard and Krebs produced an air ship which was considered the crowning effort in this line of invention. This ship was a cigar-shaped balloon, carrying a platform, on which the steering and propelling apparatus was placed. The balloon was made of strong silk and covered with a light netting of cords. It was 197 feet long and 89 feet in diameter. To the netting was suspended the platform, 131 feet long and 10 feet broad, on the front of which was fixed the propeller, a screw of light, wooden framework and air-tight cloth. The rudder was at the rear of the platform. The propeller was driven by electricity, generated by a dynamo, which was in turn driven by stored electricity. The first ascension of this ship fully satisfied the most sanguine expectations of its builders. It was driven seven miles and back in the space of forty minutes, and obeyed fully every movement of the rudder. During the siege of Paris, in the Franco-German war of 1870-71, ballooning was extensively used by the besieged for communication with the outer world, and also by the besiegers for military purposes, and since that date military ballooning has become an important subject of study and experiment by soldiers.

American Clocks and Watches.—The first attempt to manufacture watches or clocks on a large scale in America was made by Eli Terry, a Connecticut Yankee, who invented wooden wheels for clocks in 1792. In 1837 Chauncey Jerome, of Massachusetts, first applied machinery to the making of metal-wheeled clocks, and as a result drove the wooden-wheeled clocks out of the market. The manufacture of watches by machinery, which has since become such an important business, was begun at Roxbury, Mass., in 1850, and was continued there until 1854, when the works were removed to Waltham.

Archimedes, Principle of.—Archimedes, the most celebrated of ancient mathematicians, was born at Syracuse about 287 B. C. He is said to have been a kinsman of King Hiero, though he does not seem to have held any public office, but devoted himself entirely to science. He is the only one of the ancients who contributed anything satisfactory on the theory of mechanics and on hydrostatics. He first established the truth that a body plunged in a fluid loses exactly as much of its weight as is equal to the weight of the fluid displaced by it. This is one of the most important principles in the science of hydrostatics, and is called by his name. It was by this law that he determined how much alloy the goldsmith, whom Hiero had commissioned

to make a crown of pure gold, had fraudulently mixed with the metal. The solution of the problem had suggested itself to him as he was entering the bath, and he is reported to have been so overjoyed as to hasten home without waiting to dress, exclaiming, "I have found it! I have found it!" Among the numerous inventions ascribed to Archimedes is that of the endless screw, and the cochlea, or water-screw, in which the water is made in a manner to ascend by its own gravity.

Atlantic Cables.—In July, 1866, the first permanent Atlantic cable was laid from Valentia Bay, Ireland, to Trinity Bay, N. F., and in September of the same year a cable which had been lost in 1865 was recovered and its laying completed, thus giving two lines between the two points. These lines were known as the Anglo-American Cable, and were managed by a company of the same name. The French Atlantic Telegraph Company was formed in 1868, and it laid a line from Brest, France, to Roxbury, Mass., the following year. In the summer of 1873 the fourth Atlantic telegraph cable was laid from Valentia, Ireland, to Heart's Content, Trinity Bay, N. F., and the Brazilian telegraph cable was laid from Rio de Janeiro, Brazil, to a bay on the coast of Portugal a few months later. The Direct United States Cable Company was formed, and laid a line from Ballenskillings Bay, Ireland, to Rye, N. H., via Nova Scotia, in 1874. The same year a sixth line across the Atlantic was laid from Ireland to Newfoundland, and in 1880 another French line was laid from Brest to St. Pierre, an island in the Gulf of St. Lawrence. In 1884-'85, the companies owning all these lines having previously formed a combination to keep up rates, a competing company was formed by James Gordon Bennett and Mr. Mackay, who laid two lines from Ireland to Nova Scotia, and also a connecting line from Ireland to France. The difficulty with these submarine cables at first was to send through them a current of sufficient power to record the message. The method adopted is as follows: Two keys, which when depressed transmit respectively positive and negative currents, are employed at the sending station, in connection with the battery. The current of the battery does not pass directly into the cable, but into a condenser, which passes it into the submarine line. This greatly increases the force of the current used, and serves to cut off interfering earth-currents. The receiving-instrument first employed was a reflecting galvanometer. Upon the magnet of this instrument is carried a small curved mirror. About two feet in front of it is placed a lamp behind a frame in

which is a vertical slit, while above it is a screen. The light from this lamp, passing through the slit, falls on the surface of the mirror, which throws it back upon the screen. The flash of light, moving from right to left with the motion of the needle, indicates the message sent. This method, however, has been of late years almost entirely superseded by an invention called the syphon galvanometer. In this the movements of the needle are recorded by means of ink spurted from a fine glass syphon-tube. This tube is attached to a coil suspended between two fixed magnets, which swing to right or left as the pulsations of the needle pass through it. The possibility of laying an electric cable in the Atlantic from Europe was suggested by Professor Morse as far back as 1843, but it was not until 1854 that Mr. Cyrus W. Field discussed the means of practically realizing the idea, and it is to his energy that the successful completion of this great work is due.

Aurora Borealis.—Since the discovery of electricity, and especially electro-magnetism, all speculation on the nature of the aurora has taken in that force as a principal element, and modern experiments have been especially turned to securing proof of the electric nature of the auroral display. The theory advanced by M. De La Rive, a Genoese scientist, and which is generally accepted, is, that the aurora is caused by the recomposition of the positive and negative electricity, always to be found in the upper and lower strata of air respectively. Miniature auroras have been produced by electricity by M. De La Rive, and also by a M. Lenstrom. In M. Lenstrom's experiments, which were made in Finland in 1882, the peak of a mountain was surrounded with a coil of copper wire, pointed at intervals with tin nibs. This wire was charged with electricity, and a yellow light was produced on the tin points, in which the spectroscopic analysis revealed the greenish yellow ray that characterizes the aurora borealis. The aurora was supposed to be of supernatural origin by the ancients.

Armor.—The warlike Europeans at first despised any other defense than the shield. Skins and padded hides were first used; and brass and iron armor, in plates or scales, followed. The first body armor of the Britons were skins of wild beasts, exchanged, after the Roman conquest, for the well tanned leathern cuirass. This latter continued until the Anglo-Saxon era. Hengist is said to have had scale armor, A. D. 449. The heavy cavalry were covered with a coat of mail, 1216. Armor became exceedingly splendid about 1350. The armor of plate commenced, 1407. The armor of Henry VII. consisted of a cuirass of steel,

in the form of a pair of stays, about 1500. Armor ceased to reach below the knees in the time of Charles I., 1625.

Artillery.—The first piece was a small one, contrived by Schwartz, a German cordelier, soon after the invention of gunpowder in 1330. Artillery was used, it is said, by the Moors at Algieras in Spain, in the siege of 1341; it was used, according to historians, at the battle of Cressy, in 1346, when Edward III. had four pieces of cannon, which gained him the battle. Artillery was used at the siege of Calais, 1347. The Venetians first employed artillery against the Genoese at sea, 1377. Cast in England, together with mortars for bombshells, by Flemish artists in Sussex, 1543. Made of brass, 1635. From this time forward the improvement in field artillery has been rapid and important.

Astronomy.—The earliest accounts we have of this science are those of Babylon, about 2234 B. C. The study of astronomy was much advanced in Chaldea under Nabonassar; it was known to the Chinese about 1100 B. C.; some say many centuries before. Lunar eclipses were observed at Babylon with exceeding accuracy, 720 B. C. Spherical form of the earth, and the true cause of lunar eclipses, taught by Thales, 640 B. C. Further discoveries by Pythagoras, who taught the doctrine of celestial motions, and believed in the plurality of habitable worlds, 500 B. C. Hipparchus began his observations at Rhodes, 167 B. C., began his new cycle of the moon in 143, and made great advances in the science, 140 B. C. The procession of the equinoxes confirmed, and the places and distances of the planets discovered, by Ptolemy, A. D. 130. After the elapse of nearly seven centuries, during which time astronomy was neglected, it was resumed by the Arabs about 800; and was afterwards brought into Europe by the Moors of Barbary and Spain, but not sooner than 1201, when they also introduced geography. True laws of the planetary motions discovered by Kepler 1619; the discoveries of Galileo were made about 1631. Newton's *Principia* published and the system as now taught incontrovertibly established, A. D. 1687; *Mécanique Céleste*, published by La Place, 1796.

Ax-Wedge.—These instruments, with the lever, and various others of a coarse construction and still in common use, are said to have been invented by Dædalus, an artificer of Athens, to whom also is ascribed the invention of masts and sails for ships, 1240 B. C. Many tools are represented on the Egyptian monuments.

Beer, Origin of.—The Germans, Gauls, and Bretons manufactured beer from barley

and wheat as far back as there are any written records regarding them. Tacitus tells us that beer was a common beverage of the Germans when he wrote, in the first century. We learn from Pliny that "The people of Spain, in particular, brew this liquor so well that it will keep a long time." He describes it as made from corn and water. The earliest of Greek writers speak of wine made from barley, and of the art of making it as derived from the Egyptians. It is believed that Archilochus, the Parian poet, who lived about 700 B. C., referred to beer drinking when he depicted the follies and vicious indulgences of his time. In the ancient writings of China reference is made to a fermented drink called "sam-shoo," made from rice. When it was first invented is unknown, but it was probably long before the Christian Era.

Blood, Circulation of.—The true theory regarding the circulation of blood was discovered by the celebrated English physiologist, William Harvey, about 1616. He received his diploma as Doctor of Medicine from the University of Padua in 1602, and in 1615 was made Lecturer at the College of Physicians in London, an appointment which he held for forty years. It is generally supposed that he expounded his views regarding blood circulation in his first course of lectures. He died at London June 8, 1657.

Bonnet.—The English bonnet, which was superseded in the early part of the sixteenth century by the hat, was made of cloth, silk, or velvet, less or more ornamented, according to the taste or means of the wearer. In Scotland, however, bonnets were universally worn for a century or two later, and they still are, to a certain extent, a national characteristic. The bonnet worn by the Lowland Scottish peasantry was of a broad, round, and flat shape, overshadowing the face and neck, and of a dark-blue color, excepting a red tuft like a cherry on the top. It was made of thick milled woolen, and with reasonable care would last a man his whole life. From having been worn, till comparatively late times, by small rural proprietors—such as owners of a cottage and an acre or two of land—it gave to these local notabilities the distinctive appellation of Bonnet Lairds. The bonnets worn by the Highlanders were made of the same fabric, but rise to a point in front and are without any rim. From time immemorial these various kinds of Scots bonnets have been manufactured at Stewarton, a small town in Ayrshire. Formerly the Stewarton bonnet makers formed a corporation, which, like other old guilds, was governed by regulations conceived in a narrow and often amusingly absurd spirit; one of the rules of

of the fraternity, however, can be spoken of only with commendation, for it enforced a certain weight of material in each bonnet, as well as durability in the color.

Botanic Gardens.—In 1809 A. D., the first approach to a botanic garden was made in the garden of Matthæus Salvaticus, at Salerno, botanic science, however, being merely subservient to medicine; and it was not until 1533 that the first true botanic garden was formed. This was made for Gaspar de Gabrieli, a wealthy Tuscan noble at Padua, and was followed by similar gardens at Pisa, Florence, Bologna, and Rome, the first public garden being that at Pisa. In 1545 a public garden was established at Padua by decree of the Republic of Venice. In 1580 the Elector of Saxony established a public botanic garden at Leipzig, which was soon followed by others. There was no botanic garden in France till Louis XIII. established the *Jardin des Plantes* at Paris, which was completed in 1634. The first public botanic garden was established in England at Oxford by the Earl of Danby, although numerous private gardens had existed in England for the greater part of a century. The botanic garden at Edinburgh, the first in Scotland, was founded about 1680. The botanic garden at Kew occupies a high place among British national institutions, and possesses one of the richest collections of plants in the world. The gardens connected with the imperial palace at Schönbrunn, in Austria, and that of Berlin, are the greatest in Germany. The *Jardin des Plantes* in Paris undoubtedly may be regarded as holding the first place on the continent of Europe, both with reference to the strictly scientific study of botany and to the care bestowed upon the introduction and diffusion of useful or beautiful plants from all parts of the world. In the United States the botanic gardens of New York and Philadelphia are the most worthy of notice.

Brain.—The latest classification of races, according to Bastian and other experts, shows weight of brain, in ounces, as follows: Scotch, 50.0; Germans, 49.6; English, 49.5; French, 47.9; Zulus, 47.5; Chinese, 47.2; Pawnees, 47.1; Italians, 46.9; Hindoo, 45.1; Gypsy, 44.8; Bushmen, 44.6; Esquimaux, 43.9. Compared with size of body, the brain of the Esquimaux is as heavy as the Scotchman's.

The measurement of that part of the skull which holds the brain is stated in cubic inches thus: Anglo-Saxon, 105; German, 105; Negro, 96; Ancient Egyptian, 93; Hottentot, 58; Australian native, 58.

In all races the male brain is about 10 per cent. heavier than the female. The highest class of apes has only 16 oz. of brain.

A man's brain, it is estimated, consists of 800,000,000 nerve cells, of which over 8,000 are disintegrated and destroyed every minute. Every one, therefore, has a new brain once in sixty days. But excessive labor, or the lack of sleep, prevents the repair of the tissues, and the brain gradually wastes away. Diversity of occupation, by calling upon different portions of the mind or body, successively affords, in some measure, the requisite repose to each. But in this age of overwork there is no safety except in that perfect rest which is the only natural restorative of exhausted power. It has been noticed by observant physicians in their European travels that the German people, who, as a rule, have no ambition and no hope to rise above their inherited station, are peculiarly free from nervous diseases; but in America, where the struggle for advancement is sharp and incessant, and there is nothing that will stop an American but death, the period of life is usually shortened five, ten, or twenty years by the effects of nervous exhaustion.

After the age of 50 the brain loses an ounce every ten years. Cuvier's weighed 65, Byron's 79, and Cromwell's 90 ounces, but the last was diseased. Post-mortem examinations in France give an average of 55 to 60 ounces for the brains of the worst class of criminals.

Beds.—The ancients slept on skins. Beds were afterwards of loose rushes, heather, or straw. The Romans are said to have been the first to use feathers. An air-cushion is said to have been used by Heliogabalus, 218-222; air beds were in use in the sixteenth century. Feather beds were used in England in the reign of Henry VIII. The bedsteads of the Egyptians and later Greeks, like modern couches, became common among the Roman upper classes.

Bells were used among the Jews, Greeks, and Romans. The responses of the Dodonean oracle were in part conveyed by bells. The monument of Porsenna was decorated with pinnacles, each surmounted by bells. Said to have been introduced by Paulinus, bishop of Nole, in Campagna, about 400; and first known in France in 550. The army of Clothaire II., king of France, was frightened from the siege of Sens by the ringing of the bells of St. Stephen's church.

Bells were used in churches by order of Pope John IX., about 900, as a defense, by ringing them, against thunder and lightning. Bells are mythically said to have been cast by Turketul, Abbot of England, about 941. His successor improved the invention, and caused the first tunable set to be put up at Croyland Abbey, 960. In most Catholic states, bells are baptized as we do ships, but with religious solemnity.

Billiards.—Invented by the French, by whom, and by the Germans, Dutch, and Italians, they were brought into general vogue throughout Europe. The French ascribe their invention to Henrique Devigne, an artist, in the reign of Charles IX., about 1571. Slate billiard tables were introduced in England in 1827.

Boots, said to have been the invention of the Carians, were mentioned by Homer, 907 B. C., and frequently by the Roman historians. A variety of forms may be seen in Fairholt's "Costume in England." An instrument of torture "termed the boot" was used in Scotland upon the Covenanters about 1686.

Botany.—Aristotle is considered the founder of the philosophy of botany. The *Historia Plantarum* of Theophrastus was written about 320 B. C. Authors on botany are numerous from the earlier ages of the world to the close of the fifteenth century, when the science became better understood. The study was advanced by Fuchsius, Bock, Bauhin, Cæsalpinus, and others, between 1535 and 1600. The system and arrangement of Linnaeus, the first botanist of modern times, made known about 1750; Jussieu's system, in 1758. At the time of the death of Linnaeus, A. D. 1778, the species of plants actually described amounted in number to 11,800. The number of species of all denominations now recorded cannot fall short of 100,000.

Bottles in ancient times were made of leather. The art of making glass bottles and drinking-glasses was known to the Romans at least before 79 A. D.; for these articles and other vessels have been found in the ruins of Pompeii. Bottles were made in England about 1558.

Bread.—Ching-Noung, the successor of Fohi, is reputed to have been the first who taught men (the Chinese) the art of husbandry, and the method of making bread from wheat, and wine from rice, 1998 B. C. Baking of bread was known in the patriarchal ages; it became a profession at Rome, 170 B. C. During the siege of Paris by Henry IV., owing to the famine which then raged, bread, which had been sold whilst any remained for a crown a pound, was at last made from the bones of the charnel-house of the Holy Innocents, A. D. 1594. In the time of James I. the usual bread of the poor was made of barley; in Iceland codfish beaten to powder is made into bread; potato bread is used in Ireland. Bread was made with yeast by the English bakers in 1684. In 1856 and 1857, Daughlish patented a mode of making "aerated bread" in which carbonic acid gas is combined with water and mixed with the flour,

and which is said to possess the advantages of cleanliness, rapidity, and uniformity.

Bricks were used in Babylon, Egypt, Greece, and Rome; in England by the Romans about 44. Made under the direction of Alfred the Great, about 886. The size regulated by order of Charles I., 1625. Brick machines were invented by Messrs. Cook and Cunningham in 1839; by Messrs. Dixon and Corbett in 1861.

Butter.—It was late before the Greeks had any notion of butter, and by the early Romans it was used as a medicine only, never as food. The Christians of Egypt burned butter in their lamps instead of oil, in the third century. In Africa vegetable butter is made from the fruit of the shea tree, and is of richer taste, at Kebba, than any butter made from cow's milk.

Calico Printing.—The art of calico printing was introduced into Europe about the seventeenth century, although it is believed to have been known in India and Egypt as early as the first or second centuries. In this early period the printing was done by means of blocks on which the designs to be transferred to the cloth had been engraved in relief. These were dipped into dye-stuff, and then pressed upon the material by hand. Later, presses for this block-printing were invented, and the use of several was introduced so engraved as to fill up each other's vacancies, and thus several colors were put into the pattern. About 1770 copper-plate printing was invented in England. By this method the design was cut into plates, the color filled into the sunken parts of the engraving, and the cloths were printed by being pressed upon it. This invention finally led to the introduction of cylinder-printing, the method now in use. The cylinders are of copper, and the design is engraved upon their surface. A separate cylinder is required for each color or shade of color to be used in printing the cloth, and in fine and intricate designs as many as twenty cylinders are sometimes used. These are set in a strong frame against the face of a large central drum made of iron and covered with woollen cloth in several folds, between which and the cylinders the calico is printed as it passes. The color is spread upon the cylinders, as they revolve, by contact with another roller, which dips into a trough containing the coloring-matter properly thickened. This roller is made of an absorbent, elastic material, similar to the roller used in inking a printing press. Each cylinder thus receives its proper color, and imparts it, in revolving, to the calico pressed between its face and that of the fixed drum. A sharp blade of metal pressing against the copper cylinder removes all

superfluous color from its surface, so that only the design cut in the metal is imprinted in clear outline upon the cloth. The employment of a number of rollers to make one design is attended with much difficulty, as in passing under them the cloth is in much danger of being displaced and the regularity of the print destroyed. As the cloth leaves the printing-machine it is drawn over rollers through a hot-air chamber, by which it is thoroughly dried, and the colors become fully set.

Candles.—It was not until the fourteenth century that candles having any resemblance to those now in use were manufactured. Previous to that time our English ancestors soaked splints of wood in fat or oil to obtain their light. The candles used by the Greeks and Romans were rude torches made by dipping strips of papyrus or rushes into pitch and then coating them with wax. These candles were also in use in Europe during the middle ages, and were very large and heavy. A dipped candle made from tallow was introduced in England in the fourteenth century, and wax-candles were also made at the same time. These latter were very costly, and were considered great luxuries. In 1484 a company for the manufacture of wax candles was incorporated in London. Mold candles are said to be the invention of the *Sieur La Brez*, of Paris.

Casting Plate-Glass.—The whole operation of casting a plate of glass occupies but a very short time. The casting-tables, the most important pieces of apparatus in plate-glass works, are 19 feet long, 14 feet wide, and 7 inches thick. Each is provided with an iron roller 30 inches in diameter and 15 feet long. Strips of iron on each side of the table afford a bearing for the rollers and determine the thickness of the plate of glass to be cast. The rough plate is commonly $\frac{9}{16}$ ths of an inch in thickness. After polishing, it is reduced to $\frac{6}{16}$ ths or $\frac{7}{16}$ ths. The casting-tables are mounted on wheels, and run on a track that reaches every furnace and annealing-oven in the building. The table having been wheeled as near as possible to the melting-furnace, the pot of molten glass is lifted by means of a crane and its contents quickly poured on the table. The heavy iron roller is then passed from end to end, spreading the glass into a layer of uniform thickness. The cold metal of the table cools the glass rapidly. As soon as possible the door of the annealing-oven is opened and the plate of glass introduced. The floor of the oven is on the same level as the casting-table so the transfer can be conveniently and quickly made. When, after several days, the glass is taken out of the oven, its surface is found to be decidedly rough and

uneven. A small quantity is used in this condition for skylights and other purposes where strength is required without transparency. It is known as rough-plate. The greater part of the glass, however, is ground, smoothed, and polished before it leaves the establishment. Few industries offer such fine scenic displays as the pouring of the molten glass.

Celluloid is made from the cellulose contained in cotton cloth or raw cotton. The cotton is treated to a weak solution of nitric acid. This has the effect of making a pulp of cotton very much like paper pulp. After the acid has acted the pulp is treated to a copious water-bath that in a large measure washes out the acid. Then it goes through a partial drying process, and a large quantity of camphor-gum is mixed with it, and it is rolled into sheets ready for the drying-room, where it is dried on hot cylinders, the same as paper is dried. It can be softened by steam, but hardens again when it is dry. Celluloid, when ready for market, burns as readily as ordinary sealing-wax.

Chess, Origin of.—Although the origin of chess is enshrouded in considerable mystery, there is but little doubt that its birthplace was in India, and that it is an offspring of a game called *Chaturanga*, which is mentioned in Oriental literature as in use fully 2,000 years before the Christian era. From India chess spread into Persia, and thence into Arabia, and ultimately the Arabs took it to Spain and the rest of Western Europe. The game was in all probability invented for the purpose of illustrating the art of war. The Arablegend upon this point is that it was devised for the instruction of a young despot by his father, a learned Brahman, to teach him that a king, notwithstanding his power, was dependent for safety upon his subjects. The Greek historians credit the invention of the game to *Palamedes*, who, they claim, devised it to beguile the tedium of the siege of Troy during the Trojan war.

Common Names of Chemical Substances.

| | |
|-----------------------------|-----------------------------------|
| Aqua Fortis, | Nitric Acid. |
| Aqua Regia, | Nitro-Muriatic Acid. |
| Blue Vitriol, | Sulphate of Copper. |
| Cream of Tartar, | Bitartrate Potassium. |
| Calomel, | Chloride of Mercury. |
| Chalk, | Carbonate Calcium. |
| Salt of Tartar, | Carbonate of Potassium. |
| Caustic Potassa, | Hydrate Potassium. |
| Chloroform, | Chloride of Gormyle. |
| Common Salt, | Chloride of Sodium. |
| Copperas, or Green Vitriol, | Sulphate of Iron. |
| Corrosive Sublimata, | Bi-Chloride of Mercury. |
| Diamond, | Pure Carbon. |
| Dry Alum. | Sulphate Aluminium and Potassium. |
| Epsom Salts, | Sulphate of Magnesia. |
| Ethiops Mineral, | Black Sulphide of Mercury. |
| Galena, | Sulphide of Lead. |

Glauber's Salt,
Glucose,
Iron Pyrites,
Jeweler's Putty,
King's Yellow,
Laughing Gas,
Lime,
Lunar Caustic,
Muriate of Lime,
Niter or Saltpeter,
Oil of Vitriol,
Potash,
Realgar,
Red Lead,
Rust of Iron,
Sal-ammoniac,
Slacked Lime,
Soda,
Spirits of Hartshorn,
Spirit of Salt,

Stucco, or Plaster of Paris,
Sugar of Lead,
Verdigris,
Vermilion,
Vinegar,
Volatile Alkali,
Water,
White Precipitate,
White Vitriol,

Sulphate of Sodium.
Grape Sugar.
Bi-Sulphide Iron.
Oxide of Tin.
Sulphide of Arsenic.
Protoxide of Nitrogen.
Oxide of Calcium.
Nitrate of Silver.
Chloride of Calcium.
Nitrate of Potash.
Sulphuric Acid.
Oxide of Potassium.
Sulphide of Arsenic.
Oxide of Lead.
Oxide of Iron.
Muriate of Ammonia.
Hydrate Calcium.
Oxide of Sodium.
Ammonia.
Hydro-Chloric, or Muriatic Acid.
Sulphate of Lime.
Acetate of Lead.
Basic Acetate of Copper.
Sulphide of Mercury.
Acetic Acid (diluted).
Ammonia.
Oxide of Hydrogen.
Ammoniated Mercury.
Sulphate of Zinc.

Chemistry was introduced into Spain by the Moors about 1150. The Egyptians and Chinese claim an earlier acquaintance with chemistry. The first chemists were alchemists; but chemistry was not a science until the seventeenth century, during which it was promoted by Bacon, Hooke, Mayow, and Boyle. In the early part of the eighteenth century, Dr. Stephen Hales laid the foundation of pneumatic chemistry, and his contemporary, Boerhaave, combined the study of chemistry with medicine. These were succeeded by Bergman, Stahl, Black, and others. In 1772, Priestley published his researches on air, having discovered the gases, oxygen, ammonia, etc., and thus commenced a new chemical era. The nineteenth century opened with the brilliant discoveries of Davy, Dalton, Faraday, Thompson, and Silliman. Organic chemistry has been very greatly advanced by Berzelius, Liebig, Dumas, Laurent, Hoffmann, Cabours, Frankland, and others, since 1830.

Climate.—*Climate* is the state of the atmosphere in regard to temperature, winds, moisture, and salubrity.

The climate of a place as regards temperature depends upon :—

Latitude.—The general law is that the amount of heat is greatest at the equator, and diminishes toward the poles. There are three reasons for this: 1. The sun's rays fall perpendicularly upon the earth at the equator, and more and more obliquely as we go toward the poles. 2. The area covered by a given amount of heating power from the sun is smaller at the equator. 3. Where the sun's rays fall perpendicularly they pass through a less amount of atmosphere, and the absorption of heat is less.

Altitude.—The decrease in temperature is about 3 deg. F. for every 1,000 feet of elevation. As the air receives most of its heat by radiation and reflection from the earth, and as the higher we go the less dense the air, the less heat is absorbed either from the earth or from the direct rays of the sun.

Prevailing Winds.—Winds blowing from the tropical regions carry the heat with them, and, conversely, winds from the polar regions lower the temperature. Whichever wind prevails throughout the year in a given place will consequently modify the temperature of that place.

Length of Day.—During the day the earth receives from the sun more heat than it radiates into space; while during the night it radiates more than it receives. Hence a succession of long days and short nights results in an accumulation of heat, raising the average temperature and producing summer; while long nights and short days result in a temperature below the average, producing winter. The heating power of the sun is greater in summer, because at that season it is shining more directly upon that part of the earth, and conversely in winter. In the tropical regions the inequality of day and night is very little, but increases toward the poles. The temperature in the tropics is therefore more uniform. The length of day makes up for the lessened intensity of the sun's rays; hence a place in high latitude may have at times higher temperature than a place within the tropics.

Ocean Currents.—The warm waters of the tropical regions being brought toward the polar regions bring the heat with them, radiating it into space, and it is absorbed by the atmosphere.

Mountain Ranges.—A mountain range will make a country near it warmer or colder, according as it shields it from a cold or warm wind.

The Distribution of Land and Water.—Land heats or cools rapidly, absorbing or emitting but little heat. Water heats or cools slowly, absorbing or emitting large quantities of heat. Hence the land is subject to great and sudden changes of temperature; the water to small and gradual changes. Places situated near the sea have, therefore, a more equable climate.

Character of Soil.—Dry, sandy soil heats and cools more rapidly than wet and marshy lands; hence the latter will have a more uniform temperature.

Slope of Land.—Land which slopes so that the sun's rays will strike it nearer vertically will receive more heat. The south side of a hill is warmer in winter than the north side.

In regard to *winds* the climate of a place depends upon :—

Temperature.—As winds are but masses of air set in motion by the unequal heating, the winds of any given place depend primarily upon the temperature, though not necessarily upon the temperature of that place. As the air is heated in the tropical parts of the earth by the sun, it rises, and colder air flows in from the polar regions to take its place; hence the primary currents, which are modified in various ways by other causes.

Rotation of the Earth.—The winds are turned out of their course by the rotation of the earth in the same manner as the ocean currents.

Land and Water.—The land becomes warmer during the day than the sea, and, the air rising, a cooler air flows in from the sea. At night the land parts with its heat more rapidly than the water and becomes cooler; then the wind sets the other way. Hence we have the land and sea breezes.

Elevation of the Land.—Mountains, as has already been stated, shelter places from winds. Some of the great plains are subject to almost constant winds.

In regard to *moisture*, the climate of a place depends upon:—

Prevailing Wind.—If a wind blows from large bodies of water in a warm region it will be laden with moisture which will be likely to be precipitated on reaching a colder country.

Mountains.—The contact of a moisture-laden wind with the cold sides of mountains will cause a precipitation of its moisture, and the regions beyond the mountains will not receive it.

Forests, by shading the earth, keep its surface cool, and this tends to condense the moisture.

Cultivation of the Soil, causing it to absorb moisture from the atmosphere, and by capillary attraction in dry weather bring up moisture from below to the surface.

Temperature.—Increased heat causes greater evaporation, and hence more moisture in the atmosphere. More rain falls within the tropics than in the temperate or polar regions.

Land and Water.—More rain falls on the coasts of a country than in the interior, because the winds are more moist. More rain falls in the northern hemisphere than in the southern, because there is a greater diversity of land and water, the evaporation coming mainly from the ocean, and the condensation from the diversified land surface.

Isothermal lines are lines connecting places that have the same mean temperature.

There is a line or limit of elevation, above which the surface is covered with perpetual snow; this is called the *snow-line*.

Coaches.—Covered carriages appear to have been used by the old Romans. In the

year 1588, Duke Julius of Brunswick published an act against riding in coaches. Philip II. of Pomerania-Stettin published a similar document in 1608. Coaches appear to have been used in France very early. An ordinance of Philip the Fair, issued in 1294, for suppressing luxury, forbids citizens' wives to ride in coaches. Coaches were first used in England in 1565, the first being that made for the Earl of Rutland. In 1601 an act was passed to prevent men riding in coaches, on the score of its effeminacy. Coaches began to be common in 1605, and were petitioned against by the saddlers and other. Hackney coaches introduced in 1634. In 1661, a stage coach was two days going from London to Oxford, and the "flying coach" was thirteen hours, even in summer weather, when the roads were at their best.

Coffins.—Athenian heroes were buried in coffins of the cedar tree, owing to its aromatic and incorruptible qualities. Coffins of marble and stone were used by the Romans. Alexander is said to have been buried in one of gold; and glass coffins have been found in England. The earliest record of wooden coffins among the English speaking people is that of the burial of King Arthur in an entire trunk of oak, hollowed, A. D. 542. The patent coffins were invented in 1796.

Coin.—Silver was first coined by Phidon, King of Argos, 869 B. C. In Rome, silver money was first coined 269 B. C. Gold and silver coins first used in the East. Coin first used in Britain 25 B. C., and in Scotland not until 248 years later. In 1101, round coins were first used in England. Silver halfpence and farthings were coined in the reign of John, and pence were the largest current coins. Gold was first coined in England in 1087; in Bohemia, in 1301. In 1531, groats and half-groats were the largest silver coin in England. Gold was first coined in Venice in 1346. Shillings were first coined in England in 1068. Crowns and half-crowns were first coined in 1551. Henry III. introduced copper money into France in 1580. Copper money introduced into England by James I. in 1620. The process of milling coin introduced in 1662. The mint of the United States of America was established in 1793.

Comets.—It has been lately suggested that there is a great degree of affinity between comets and meteors—in fact, that a comet is merely an aggregation of meteors. Comets have been supposed to be bodies of burning gas. Their mass is very great, and their brilliant tails are many millions of miles in extent. In their orbits, they differ greatly from the planets. While the latter are direct

in their wanderings, comets are most irregular and eccentric. When first seen, the comet resembles a faint spot of light upon the background of the sky. As it comes nearer, the brightness increases and the tail begins to show.

The term comet signifies a hairy body. A comet consists usually of three parts: the nucleus, a bright point in the center of the head; the coma (hair), the cloud-like mass surrounding the nucleus; and the tail, a luminous train extending generally in a direction from the sun.

It is not understood whether comets shine by their own or by reflected light. If their nuclei consist of white-hot matter, a passage through such a furnace would be anything but desirable.

The discovery of the elliptical orbit of comets is due to Halley. He discovered a comet in 1682 which he demonstrated to be a return of the comet described by Kepler in 1607; that it had appeared in 1531, and that it was the comet that had appeared still earlier by the same period of seventy-five years, in 1457, and that had caused such consternation among the Christians, who regarded it as a sign,—Constantinople having just fallen and all Europe being threatened by the Turks. Halley also predicted the return of the comet in 1757. It reached its perihelion in 1759. Its last appearance was in 1835. It will be looked for in 1911.

Encke's, Biela's, and the comets of 1843 and 1848 are comparatively recent. Others came in 1861, 1874, 1883. In 1881, two comets appeared. Some comets of antiquity were very remarkable, and are reputed to have equaled the sun in magnitude. One tail is usually supposed to be the distinguishing mark of a comet, but in 1774 one appeared with six tails, arranged something like a fan. Sometimes the tail is separated from the head. Some comets appear at regular intervals, and their approach can be determined with accuracy. Of course we only see those which are attracted by the sun, or those which revolve in the solar system. There must be thousands of other comets which we never see at all.

Compass, The.—The directive power of the magnet seems to have been unknown in Europe until late in the twelfth century. It appears, however, on very good authority, that it was known in China and throughout the east generally at a very remote date. The Chinese annals assign its discovery to the year 2634 B. C., when, they say, an instrument for indicating the south was constructed by the Emperor Hon-ang-ti. At first, they would appear to have used it exclusively for guidance in traveling by land. The earliest date at which we hear of their using it at sea is somewhere about A. D. 300. According to one account, a knowledge of the compass was brought to

Europe by Marco Polo on his return from Cathay. It was long contended that the compass as a nautical instrument was first invented by Flavio Gioja, a native of Amalfi, about the year 1382, and that the section of the Kingdom of Naples where he was born has a compass for its arms. For this there is no authority whatever, as the compass was well known as a nautical instrument before his time. The phenomena of the magnetic needle which perplex scientists most are that in every place it is subject to variations. By observation at Paris it was found that in 1681 the needle varied 2 degrees 30 minutes to the west; in 1865, 18 degrees 44 minutes to the west. At London, between 1580 and 1692, the needle varied from 10 degrees 15 minutes east to 6 degrees west. In Dakota the average variation is 12 degrees 30 minutes east, in Minnesota 11 degrees east, while in Montana it is 20 degrees east. In a work on Government Surveys it is stated that "the needle does not point due north except in a few localities, and at no place does it continue to point with a given angular distance from the north for any stated length of time. It changes secularly, annually, diurnally and hourly, and is, further, subject to fluctuations reducible to no method of tabulation." In the vicinity of iron or magnetic sands, the needle is deflected toward the material attracting it.

Compressed-Air Engines.—The arrangements of atmospheric engines is largely identical with that of non-condensing steam-engines, and they are used very generally both in the United States and Europe in the construction of tunnels, their great advantage being that in place of escaping heat and steam, which would seriously vitiate the close air in the shaft, the working of the engine gives out pure cold air, serving also the purpose of ventilation. An engine worked by compressed air, however, can never be a prime motor in itself, since the air which propels it must be compressed by another power—either steam, electricity, falling water, or animal force. There are several ways of applying this compressed air. One is to fill with it a large, strong cylinder or reservoir, and use it to work a piston in the same way that steam is used. Another is to conduct the air from the prime motor in tubes to several smaller engines. In the construction of the Mont Cenis Tunnel the hydraulic power of a cataract near the entrance of a tunnel was used as a prime motor to compress air in reservoirs, whence it was conducted by flexible tubes to work the rock-boring machines. When this boring is done by percussion of steel drills, the atmospheric pressure moves a piston connected with them. When the boring is performed by rotation, as

is the case with the diamond drill, the atmospheric engine is either a rotary or reciprocating one. Compressed air is also used with steam as a motor. Air when compressed greatly becomes very hot, and if it is then forced through hot water it becomes saturated with steam, and this steam and air are found to have enormous expansive power. This motive-power has been very successfully applied to the propulsion of street cars. In the working of electric-light machinery compressed air is used to a considerable extent.

Copernican System. The, is that which represents the sun to be at rest in the center of the universe, and the earth and planets to move round it as a center. It got its name from Copernicus, who (although some vague general notion of the system seems to be due to Pythagoras) first distinctly drew the attention of philosophers to it, and devoted his life to its demonstration. For the rest, the glory of developing on the lines he broadly laid down, belongs to Kepler, Galileo, and others, and to Newton, who finally marked out the form of modern theoretical astronomy. Many who reverence the name of Copernicus in connection with this system, would be surprised to find, on perusing his work, how much of error, unsound reasoning, and happy conjecture combined to secure for him in all time the association of the system with his name; yet, with all its faults, that work marks one of the greatest steps ever taken in science.

Corsets.—An article of dress somewhat resembling the corsets now worn by women was used in Germany and France as early as the thirteenth century, and it found its way into England in the latter half of the fourteenth century. It contained rods and plates of whalebone and steel, and was designed, we are told, to conceal the defects and exaggerate the beauties of the figure. This stiff arrangement was discarded at the time of the French Revolution owing to the Greek costume having been brought into vogue, and its place was taken by a smoothly fitting under waist.

Cotton, a vegetable wool, is the product of a shrub indigenous to the tropical regions of India and America. Indian cotton cloth is mentioned by Herodotus, was known in Arabia in the time of Mahomet 627, and was brought into Europe by his followers. It does not appear to have been in use among the Chinese till the thirteenth century; to them we are indebted for the cotton fabric termed *nankeen*. Cotton was the material of the principal articles of clothing among the American Indians, when visited by Columbus. It was grown and manufactured in Spain in the tenth century; and in the fourteenth century was in-

troduced into Italy. Indian muslins, chintzes, and cottons were so largely imported into England in the seventeenth century, that an act of parliament followed prohibiting their introduction. Cotton became the staple commodity of England in the present century. First cotton factory in America established at East Bridgewater, Mass., 1787. First power looms in the United States, 1813. The method of spinning cotton was formerly by hand; but about 1767 Mr. Hargraves, of Lancashire invented the spinning jenny with eight spindles; he also erected the first carding machine with cylinders. Sir Richard Arkwright obtained a patent for a new invention of machinery in 1769; and another patent for an engine in 1775. Crompton invented the mule, a further and wonderful improvement in the manufacture of cotton in 1779, and various other improvements have been since made. In 1793, Eli Whitney, an American, invented the cotton gin, a machine by which cotton wool is separated from the pod and cleaned with great ease and expedition.

Cremation.—The reduction of the human body to ashes by fire was a very early and widespread usage of antiquity. The early Aryans, as opposed to the non-Aryan aborigines of India, Greeks, Romans, Slavs, Celts, and Germans, burned their dead; therefore cremation may be regarded as the universal custom of the Indo-European races. The graves of North Europe throughout the "bronze age" contain only jars of ashes. The advocates of disposing of the dead by cremation are at the present time numerous, their principal arguments in favor of it being of a sanitary nature. According to the method which is most favored by modern cremationists, the body is placed in an oblong brick or iron-cased chamber, underneath which is a furnace. The air of the chamber is raised to a very high temperature before the body is put in, and a stream of heated hydro-carbon from a gasometer is then admitted, which on contact with intensely-heated air within immediately bursts into flame. The chamber is, of course, so constructed as neither to admit draughts of air from without nor to permit the escape of gas from within. The noxious gases which are evolved in the beginning of the combustion process are passed through a flue into a second furnace, where they are entirely consumed. By this process a body weighing 144 pounds can be reduced in about fifty minutes to not more than four pounds of lime-dust. In the cremation of each body about 200 pounds of fuel is used.

Crockery.—The materials used in the manufacture of crockery are kaolin, pipe-clay,

quartz or flint, and feldspar—the kaolin and quartz to give hardness, and the pipe-clay and feldspar to yield a flux sufficient to bind the masses firmly together. The materials are ground into a fine powder and then mixed with water in a machine called a “blunger,” which is a box containing paddles worked very rapidly. When the matter has been thoroughly mixed it is drawn off and forced by a hydraulic pump through a series of sieves and then worked up in what is called a pug-mill, after which it is cut by a fine wire into rectangular blocks. These blocks are then molded into the shape of the article desired, some by the use of a lathe, and some by simply shaping them with the hands. The pieces are thus partially dried, turned on a lathe with a sharp tool to give them a uniform surface, dried slowly in a drying room, then baked in an oven. In baking the ware is kept at a white heat for thirty-six hours. The pieces are then glazed by being dipped in a mixture of ground feldspar, ground flint, sal soda, plastic clay, and boracic acid, the whole pulverized and mixed with a small proportion of white lead and a little cobalt blue. This glaze is mixed with water, the articles are dipped in it one by one, receiving a deposit like a thin paste on the surface, which, when placed in the oven again, fuses and flows over it, making a coating of glassy smoothness. Fine, white china or porcelain is of course made of finer material than crockery, but the process of manufacture is similar.

Cryolite is a snow-white mineral, partially transparent, of a vitreous luster and of brittle texture. It is so named from its fusibility in the flame of a candle. It is a compound of sodium, fluorine, and aluminum, and is used for the preparation of the metal aluminum. It occurs in veins in gneiss with pyrites and galena, and has been found in western Greenland and at Miyask in the Ural Mountains. It is extensively employed in the United States in the manufacture of white porcelain glass, and also in the preparation of caustic soda.

Daguerreotype.—The name given to a process invented by M. Daguerre of Paris in 1839, by which perfect facsimiles of objects are transferred upon thin copper plates, plated with silver. The images are produced by the action of light upon the iodine through the focus of the camera obscura. An apparatus somewhat kindred in design was in contemplation about the same time by M. Niepce, and about five years previously by Henry Fox Talbot of London; the original idea, however, is traceable as far back as the days of Roger Bacon. So important a discovery in the fine arts was the daguerreotype deemed by the

French government, that it awarded to its inventor a life pension of 6,000 francs.

Damascus Steel.—The skill of the Damascenes in the manufacture of steel became famous in Europe at the time of the Crusades, but the secrets of their process have never been revealed. A Russian mining engineer, General Anosoff, by analysis and examination, however, succeeded in making steel that could scarcely be distinguished from it in appearance. The essential point of his process was melting the iron in crucibles with graphite and a small quantity of dolomite; but the details of working these materials with success were of course known only by himself, and the quality of the steel produced by the works since his death has very much deteriorated. An imitation of Damascus steel is also made in America and is often known by that name, though its proper appellation is damask steel, so called from the peculiar damask figures on its surface.

Damask Linens and Silks.—They were first manufactured at Damascus, and hence the name; have been imitated by the Dutch and Flemish. The manufacture was introduced into England by artisans who fled from the persecutions of Alva, 1571-3.

Day and Night.—The earth has two constant motions: (1) its daily motion, or rotation on its axis (its shorter diameter), from west to east; (2) its yearly motion, or movement in a nearly circular path (called its orbit) around the sun. The length of time the earth is turning on its axis is called a day. Every part of the earth's surface being successively carried into light and shade, the daily rotation causes the phenomena of day and night. The length of time the earth is in passing around the sun is called a year. It turns on its own axis in the same time about 365½ times, hence there are 365½ days in a year. As the earth revolves from west to east, the sun will appear to travel from east to west. At the equator the days and nights are always twelve hours long; the farther a point lies from the equator, the longer are its longest day and its longest night. At the poles the year is made up of but one day and one night, each lasting six months. All places in about 66½ degrees of latitude, north or south, have one day in the year twenty-four hours long, and one night of an equal length.

Dew.—For any assigned temperature of the atmosphere there is a certain quantity of aqueous vapor which it is capable of holding in suspension at a given pressure. Conversely, for any assigned quantity of aqueous vapor held in suspension in the atmosphere there is a minimum temperature at which it can re-

main is suspended. This minimum temperature is called the dew point. During the daytime, especially if there has been sunshine, a good deal of aqueous vapor is taken into suspension in the atmosphere. If the temperature in the evening now falls below the dew point, which after a hot and calm day generally takes place about sunset, the vapor which can be no longer held in suspension is deposited on the surface of the earth, sometimes to be seen visibly falling in a fine mist. Another form of the phenomenon of dew is as follows: The surface of the earth, and all things on it, and especially the smooth surfaces of vegetable productions, are constantly parting with their heat by radiation. If the sky is covered with clouds, the radiation sent back from the clouds nearly supplies an equivalent for the heat thus parted with; but if the sky be clear, no equivalent is supplied, and the surface of the earth and things growing on it become colder than the atmosphere. If the night also be calm, the small portion of air contiguous to any of the surfaces will become cooled below the dew point, and its moisture deposited on the surface in the form of dew. If the chilled temperature be below 32 degrees Fahrenheit, the dew becomes frozen, and is called *hoar-frost*. The above two phenomena, though both expressed in our language by the word "dew"—which perhaps helps to lead to a confusion of ideas on the subject—are not necessarily expressed by the same word. For instance, in French, the first phenomenon—the falling evening dew—is expressed by the word *serain*; while the latter—the dew seen in the morning gathered in drops on the leaves of plants or other cool surfaces—is expressed by the word *rosée*. Similar to *rosée* is the moisture which condenses on the outside surface of pitchers or glasses of ice-water. The air in immediate contact is cooled below the dew point and deposits the suspended moisture.

Dictionary.—A standard dictionary of the Chinese language, containing about 40,000 characters, most of them hieroglyphics, or rude representations somewhat like our signs of the zodiac, was perfected by Pa-out-she, who lived about 1100 B. C. Cyclopedias were compiled in the fifteenth and sixteenth centuries. The first dictionary of celebrity, perhaps the first, is by Ambrose Calepini, a Venetian friar; it is in Latin; he wrote another in eight languages, about A. D. 1500. Chambers's Cyclopaedia, the first dictionary of the circle of the arts and sciences, was published in 1728. The English dictionary by Samuel Johnson appeared in 1755. Noah Webster's great American dictionary of the English language

in two volumes was published at New Haven in 1828. Worcester's dictionary appeared in 1860. Harper's Latin Dictionary (founded upon Andrews's translation of Freund's Latin-German lexicon), adopted as the standard authority in English and American universities, was published in 1879.

Discovery of Gold in California.—On January 19, 1848, John W. Marshall was building a mill for himself and Sutter on the south fork of the American River, fifty-four miles east of Sutter's Fort. This mill, it was expected, would supply the ranches and settlements with pine lumber. On this particular morning Marshall picked up from the bed-rock of the race of the mill a small piece of yellow metal which weighed about seventeen grains. It was malleable, heavier than silver, and in all respects resembled gold. Marshall showed the piece in the afternoon to those who were working at the mill. The result of the discussion which ensued was the rejection of the gold theory. Marshall, however, was not satisfied, and afterward tested it with nitric acid, and found it was actually gold. He discovered pieces like it in all the surrounding gulches wherever he dug for it. The news of the discovery soon spread, and in April reports of the find were published.

Diving Bells.—The principle of the diving bell is extremely simple, and can be seen by pressing any hollow vessel mouth downward into water. Although some species of diving bell was probably used in the time of Aristotle—for it is recorded that divers took with them a vessel which enabled them to remain under water—and in mediæval times, it was not until about 1715 that any practical method of supplying the bell with air while under water was discovered. About that year this want was met by a Doctor Halley. He used two water-tight barrels, each supplied with a hose, also attached to the diving bell, and these, attached to heavy weights, were dropped on each side of the bell, and the diver could, therefore, remain under water as long as the air supplied by the barrels was fit to breathe. The diver's cap, which was made of metal and fitted with a tube for conveying air to it from the bell, so that the wearer could leave the bell and walk around the bottom of the sea, was soon after devised by the same inventor. In 1779, the air pump, which forced down air from above, was applied to diving bells by an engineer named Smeaton. The most practical bell in use at present is a sort of submarine boat, called the Nautilus, with double sides, between which water is forced to cause the boat to descend and air to cause it to rise.

Dyeing is attributed to the Tyrians, about 1500 B. C. The English are said to have sent fine goods to be dyed in Holland till the art was brought to them, probably in 1608. A statute against abuses in dyeing passed in 1783. The art has been greatly improved by chemical research. Among the most prominent names connected with the art of dyeing is that of Dr. Stenhouse, who in 1848 invented a number of beautiful dyes,—mauve, magenta, red, green, black.

Dynamite.—As generally manufactured, dynamite consists of infusorial earth, porcelain earth, coal-dust, siliceous ashes or the like, saturated with about three times its weight of nitro-glycerine, a compound which is produced by the action of a mixture of strong nitric and sulphuric acids on glycerine at low temperatures, though the proportions vary with different makers. According to its elements, it is to the eye a grayish-brown, reddish, or blackish powder, damp and greasy to the touch, and without smell. Its explosive power is about eight times greater than that of gunpowder. The manufacture of dynamite is attended with great danger, owing to the proneness of nitro-glycerine to explosion even at the slightest shock. The explosive force of the latter substance, which has the appearance of common oil, is about ten times greater than that of gunpowder.

Dynamite Gun.—The nitro-gelatine or dynamite gun, known as the "Zalinski gun," was the invention of Lieutenant Zalinski and Captain Bartlett of the United States army. It is a long tube made of wrought iron, lined with seamless brass tubing one eighth of an inch thick. The projectile used is shaped like a huge rocket, five or six feet in length. The stick of the rocket has a wooden or metal base large enough to fill the bore of the gun, and against this base the pressure of the air (the propelling force being compressed air)—1,000 pounds to the square inch—is exerted. The head of the rocket contains from fifty to sixty pounds—or more—of nitro-gelatine, a new explosive made of nitro-glycerine and gun-cotton. The projectile, being shot from the gun, is exploded, after reaching its mark, by electricity. A small battery is fixed in the head of each shot, and the discharge is effected by concussion if the shot strikes, or by action of water on a sensitized surface if the shot lights in the sea. It is thought that a submarine explosion within 100 feet of a ship will be disastrous in eight cases out of ten. The gun is from 40 to 75 feet in length, and of caliber from 6 to 10 inches. The mechanical arrangement for compressing the air in the gun and discharging the piece is said to be taken

from an invention of B. T. Babbitt, patented in 1878.

Earth's Surface, The.—The earth's surface covers an area of about 197,000,000 square miles, of which only about one fourth is land.

Lowlands are tracts, either level or diversified by hill and vale, not elevated more than 1,000 feet above sea-level. **Deserts** are extensive tracts destitute of water, and, consequently, of vegetation and animal life.

Silvas are forest plains. Plains that produce grass, but not trees, are known in North America as *prairies*; in South America as *llanos* and *pampas*; in Asia and Southeastern Europe as *steppes*.

The desert of Sahara, as far as known, consists partly of table lands and partly of low plains. It is interspersed with *oases*, or fertile spots, which are generally lower than the surrounding country; some of these are of considerable extent and well populated.

A *mountain* is an elevation of land exceeding 2,000 feet in height. A *hill* is less than 2,000 feet in height.

A *mountain chain* is a long, elevated ridge, or several mountains extending in a line.

Mountains are of great use to man. They attract the clouds, condense their moisture, and store up in reservoirs the water received from them, sending it forth again in streams, from thousands of springs, to fertilize the soil. They increase the surface of the earth, giving variety to its vegetable productions. They protect the adjacent countries from cold and piercing winds, and thus exert a favorable influence on their climate.

An *avalanche* is a large mass of snow, ice, and earth, sliding or rolling down a mountain. A water shed is the mountain chain or ridge of land which separates one basin from another, and from which the rivers flow.

A *mountain pass* is an elevated road crossing a mountain chain through a natural opening or depression.

Glaciers are immense masses of ice formed by the accumulated snows upon the mountain tops. They fill in vast valleys, and have an onward motion throughout like a liquid or semi-liquid body. Their course down the slopes is very slow, but, like rivers, they flow faster in the middle than at the bottom and sides. The lower extremities are constantly melting, forming torrents and mountain streams, while the upper parts are fed by the snows. Rocks of immense size are torn off and carried down by glaciers. They occur in the greatest numbers in the Alps. When a glacier reaches the ocean large fragments are broken off and float away as *icebergs*.

Earthquakes.—The phenomena connected with earthquakes have been variously described. Many writers refer to appearances in the heavens, or changes in the atmosphere, which to them seem to have some connection with the catastrophes they narrate. They tell of irregularities in the seasons preceding or following the shock; of sudden gusts of wind, interrupted by sudden calms; of violent rains at unusual seasons or in countries where such phenomena are almost unknown; of a reddening of the sun's disk; of a haziness in the air, often continued for months; and similar phenomena. But these are so irregular in their appearance, and have been so seldom observed associated with more than a single earthquake, that in the absence of any decided reason to the contrary there seems good ground for believing they have no real connection with the earthquake. The general opinion of investigators is that these agitations proceed from within outward, and are not of atmospheric or other external origin. True, Professor Alexis Perry, of Dijon, France, thought he discovered relations between the ages of the moon and these occurrences which seemed to sustain the theory of Zantedeschi that the liquid nucleus of the earth responds to the moon's attraction in tides, somewhat as the coast does; but the theory that the earth has a liquid nucleus covered with only a thin, solid crust is losing adherents continually. All theorists are agreed, as to the connection between volcanoes and earthquakes, that they are produced by the same subterranean agency. Mr. Mallet, in an elaborate report on the subject presented to the British Association, proposed an ingenious theory. He assumes that volcanoes and the centers of earthquake disturbances are near the sea or other large supplies of water; and he says that when an eruption of igneous matter takes place beneath the sea-bottom the first action must be to open up large fissures in its rocky material, or to lift and remove its incoherent portions, such as sand, mud, gravel, etc. The water, on meeting the heated surface, assumes the spheroidal state. While in this condition the intestine motion may be great, but little steam is generated; but no sooner have the surfaces cooled than the water comes into close contact with them, and a vast volume of steam is evolved explosively and blown off into the deep and cold water of the sea, where it is condensed, and thus a blow of the most tremendous sort is given at the volcanic focus, and, being transferred outwardly in all directions, is transmitted as the earthquake shock. Whatever their origin, whether of one cause or various causes, the prevailing opinion still is that the vibrations of

every earthquake can be traced to a focus within the earth, and that this lies directly beneath the point of greatest disturbance on the earth's surface. There are creditable records of between 6,000 and 7,000 earthquakes, between 1606 B. C. and A. D. 1842. In the great Lisbon earthquake no less than 85,000 perished, while in that of Calabria, near the end of the eighteenth century, 40,000 were destroyed. It is estimated that at least 13,000,000 of the human race have perished in this way.

Electric Light. The, was first invented by Sir Humphry Davy, in the early part of the 19th century, who produced the arc light with a battery of 2,000 cells. It was not in practical use, however, until 1844, when improvements in its manner of construction were made by a Frenchman named Foucault, and it was used to illuminate the Place de la Concord, in Paris. In 1855, Jules Duboscq's electric lamp—thus far the most perfect of the kind—was shown at the Paris Exposition; but, though improvements were made in the invention during the twenty years following, little was accomplished toward practical electric lighting until the invention of Jablochkoff's candle. Paul Jablochkoff was a Russian, who resigned his position under the government in 1875 to devote his time wholly to scientific study. It was his intention to visit the Centennial Exposition in America, but he was induced to remain in Paris, where, in 1878, he produced the electric candle, whose invention made a great sensation. The light given by this candle was soft and steady, and a great many of them speedily came into use in Europe. In the last fifteen years great progress has been made, and there are now many different styles and forms, but in their essential features they nearly all come under two general classes—the arc light and the incandescent light. The arc light is, in principle, the same as that invented by Davy, the improvements consisting in different devices for regulating and maintaining at a constant distance the tips, and in different preparations for the substance of these tips, which are generally of carbon. The light is produced as follows: Two tips connected with the opposite poles of a strong battery are brought near to each other. The electricity, overcoming the resistance of the air, jumps from one tip to the other, and in so doing generates such an intense heat that the particles on the end of the one tip are volatilized and carried to the other in a condition of white heat, forming an arc of light of intense brilliancy. Thus one tip is slowly consumed and the other somewhat increased, and hence the necessity of regulators for the tips, whence these lights

are sometimes called regulated lamps. The Brush patent is the arc light best known and most used in America. In lights of the incandescent class a lighter current is used, and the luminous substance is not consumed, being inclosed in a sealed glass bulb from which the air has been exhausted. It consists of a loop of a thin fiber of some infusible substance (carbon has been found the best), inclosed in a vacuum, as just stated. The ends of this fiber are carried through the neck of the bulb and connected with the opposite poles of the battery; then the current, in passing through such a small conductor, has to overcome a high resistance, and in so doing generates a heat sufficient to maintain the entire loop at a steady temperature of white heat. The principal forms of the incandescent light are those of Edison, Swan, Maxim, and Siemens. It is perhaps worthy of note that the great impetus given to electric lighting by the work of Thomas Edison has been not so much in improving the lamp as in cheapening the process of generating the electricity and inventing a ready mode of dividing the light. Hitherto the two principal barriers in the way of applying the electric light to public use had been the expense attendant upon the production of the electric force and the difficulty of using it simultaneously at a large number of illuminating points.

Electricity.—As far back as 321 B. C., the ancient philosopher Theophrastus mentions the power of amber to attract straws and dry leaves. Pliny, in 70 A. D., writes concerning the same phenomenon, and it is from the Greek name of "amber," Englished as "electron," that we call this phenomenon "electricity." Dr. Gilbert, of Colchester, may be considered the founder of the science of electricity, for it was he that carefully repeated the observations of the ancients, and experimented in various ways and published these experiments in a book during the period between 1540 and 1603. Sir William Watson (1715 to 1787) distinctly announced the theory of *positive* and *negative* electricity, which was afterwards elaborated by Dr. Benjamin Franklin. Dr. Franklin also established the fact that the lightning was an electrical spark, similar to that made by an electric machine or Leyden jar. In 1780, Galvani discovered that the contact of metals produced muscular contraction in the legs of a dead frog, and in 1800, Volta revealed the art of generating electricity by contact of metals with damp cloths. From these we obtained the galvanic battery and the voltaic pile.

It remained with Prof. H. C. Oersted, of Copenhagen, however, to bring forward the

most important fact, viz.: the magnetic action of the electrical current. This was in 1819. As soon as the discovery reached France, the eminent French philosopher Ampère set to work to develop the important consequences it involved. Faraday, in 1829-31, discovered induced currents. From this time up, experimentists and theorists were busy searching for ways and means by which the electrical energy could be utilized as a mechanical power, and to-day the galvanic battery and electric dynamo are rapidly ousting steam, and in a thousand ways doing its work with less noise and expense, and with better results.

As to the question of the real nature of electricity, recent experiments and further knowledge of its properties rather open fresh avenues to new hypotheses than point to the truth of any one special theory. Some identify electricity with energy, some with matter, and some with the subtle all-pervading "ether." At all events it has been computed that in every single cubic foot of ether there are locked up 10,000 foot-tons of energy. The latest researches give well-founded hopes that this inconceivably vast storehouse of power will one day be accessible to man. And herein lies the splendid possibility of a new and mighty successor to the decreasing energy of our coal-fields, with the speedy extinction of which alarmists threaten us. By creating in a room a powerful electrostatic field alternating very rapidly, Professor Nicola Tesla brought it to such a state that illuminating appliances could be placed anywhere, and kept lighted without being electrically connected with anything. He suspended two sheets of metal, each connected with a terminal of the electric coil, between which an exhausted tube, carried anyhow, remained always luminous. A true flame can now therefore be produced without chemical aid—a flame yielding light and heat without the consumption of material or any chemical process. Further, these and similar experiments on electric radiation, worked out so brilliantly by Tesla, Crookes, and Marconi, have realized the once bewildering possibility of telegraphy without wires and without cables. There is considerable evidence to show that, could the electric ether-waves be obtained sufficiently short, the rays would fall within the limits of visibility, and thus place the final crown of proof on the magnificent experiments of Hertz and others, who sought to prove light an electric phenomenon.

As regards the effect on the human body of alternating currents of very high frequency (which at best have a very doubtful reputation) it has been found that, as the rapidity of

the alternation increases, they become, not more but less dangerous. In fact, Tatum has shown that their fatal effects are nearly inversely proportionate to their frequency. Thus, with currents alternating about 5,000 per second, the current needed to become fatal is about ten times greater than at the ordinary low frequency of about 120 per second. With still higher frequencies used by Tesla (up to 20,000 per second) the currents are incomparably less dangerous than at low frequencies; but still altogether harmless.

Electricity, Storage of.—The storage of electricity is the conversion of electricity into chemical energy under such circumstances that it may be readily converted back into electricity. The secondary batteries, which are used for storing purposes, are termed "accumulators." The first battery of this kind was made by Ritter about 1803, and it consisted of a series of disks of a single metal, alternated with cloth or card moistened in a liquid by which the metal would not be affected chemically. In 1860 Mr. Gaston Plante made a secondary battery, for which he used plates of lead instead of plates of platinum. Passing a current through these, lead oxide was deposited, and after the charging-current was removed the lead and lead-oxide were found to yield a very slight current. To increase this, Plante devised the plan of first charging the plates, then discharging, then charging again with the battery-current reversed, and so on, until, by repeated oxidations and subsequent reductions of the oxidized material, very porous plates were made. These, by their porosity, exposed a large surface to the oxidizing action of the current, so that a small porous plate took up as much electricity as one of large superficial area. Plante found that by connecting a number of cells together, and, after charging them, arranging them in series—that is, the positive plate of one connecting with the negative plate of another, and so on—he could store for use quite powerful currents of electricity. In 1880 another electrician, M. Camille Faure, devised the plan of coating Plante's lead-plates with red-lead, and placing felt between them. The advantage of the red-lead is that it is very quickly made porous, and therefore the process of repeated charging of the plates, known as the "forming" process, was reduced from weeks to days, and even to hours. This discovery, by reducing the time and expense of making the secondary battery, gave it a commercial value that it never had before, and it was hailed as a great advantage. Since that time a number of patents have been obtained for storage-batteries, and they now exist in differ-

ent forms, but generally modeled on the inventions of Plante and Faure. The efforts of inventors have been mainly directed toward reducing the weight of the cells and to devising new ways of holding red-lead on the plates. This last-named substance, becoming porous, drops off readily, and for this reason the division by felt was first used. In some of the storage-batteries a plate or frame of cast lead is used, with receptacles and cells, which are filled with the red-lead.

Electroplating.—The first to gild the baser metals by means of the galvanic current was Brugnatelli, in 1803; but the first to make the process a success was the chemist De la Rive, and it has since been greatly improved by later inventions. The process depends upon the peculiar power which the electric current possesses of separating certain compound bodies into their constituent parts. For instance, if a current from a galvanic battery is passed by means of platinum electrodes through water to which sulphuric acid has been added, this chemical separation, which is called electrolysis, will take place, the water being resolved into its constituent gases, oxygen and hydrogen. Now, if some sulphate of copper be thrown into the liquid, electrolysis will still go on, with a double result: the water will be separated into its elements, and the hydrogen, by its stronger affinity, will form a new compound with the sulphur in the sulphate, setting the copper free; and the liberated copper, being electro-positive in character, will be deposited on the platinum electrode, which is negative. On this general principle the process of electroplating or electrotyping depends, and its art consists in applying the metals thus released from their solutions to artistic and useful purposes. To carry on electroplating on a large scale oblong vats are used, which hold 200 gallons of solution. Silver plates connected with a powerful galvanic battery are placed at intervals in the vats; they form the positive electrodes and correspond in extent of surface with the articles to be coated, and face them on both sides. These articles act as the negative electrodes, and are suspended by copper wire from brass rods laid lengthwise over the vats and connected with the battery. The articles are prepared for plating by being first boiled in a solution of potash to free them from all grease; they are then quickly dipped in red nitrous-acid to remove any oxide that may have formed on the surface, and after this are well washed in water to remove every trace of the acid; they are then dipped into a solution of mercury and then washed in water again. The effect of this latter operation is to make the film of silver adhere more readily.

The articles are then weighed and suspended in the solution, and are left there until a sufficient amount of silver has been deposited upon them. This amount is tested by weight. If the additional weight is not gained within the expected time the article is put in the solution again. When finally taken out, the articles are rubbed with brushes of fine wire and cleaned with fine sand; they are then polished on revolving brushes with rotten-stone, then with chamois-leather and rouge. The process of electro-gilding is essentially the same, with the exception that gold is substituted for silver.

Embalming.—The ancient Egyptians believed that their souls, after many thousand years, would come to re-inhabit their bodies, in case these latter were preserved entire. Hence arose their practice of embalming the dead. The Egyptian manner of preserving the dead has been the admiration and wonder of modern times. They render the body not only incorruptible, but it retains its full proportion of size, symmetry of feature, and personal likeness. They called the embalmed bodies mummies, some of which, buried 3,000 years ago, are perfect to this day. The art of such embalming is now lost. When Nicodemus came with Joseph of Arimathea to pay the last duties to our Saviour after his crucifixion, he brought a mixture of myrrh and aloes to embalm his body. Carboic acid was successfully employed by Professor Seely in America, in 1868. The modern method of embalming generally consists of an injection of camphorated spirits of wine into the arteries and veins, though many other chemical substances are successfully used.

Embroidery.—Its invention is generally ascribed to the Phrygians; but the Sidonians excelled in it, and it is mentioned by Homer and other ancient authors, in the year 1491 B. C. The latter were particularly skilled in decorative species of needlework. The first embroidery machine is said to have been invented by John Duncas, of Glasgow, in 1804. Heilmann's embroidery machine was patented by Kochlin. An ancient existing specimen of beautiful embroidery is the Bayeux tapestry, worked by Matilda, the queen of William the First of England. It is nineteen inches wide, 214 feet long, and is divided into compartments showing the events from the visit of Harold to the Norman court to his death at Hastings. It was reproduced by autotype process, with notes, in 1875.

Emery is found, upon analysis, to be composed of alumina, oxide of iron, and silica, with a little lime. It is a dull, opaque substance, sometimes of a grayish black, some-

times of a bluish color, and it is prepared for use by crushing the lumps in a stamp mill, and then passing the powder through sieves of different degrees of fineness. For the most delicate uses of opticians the powder is graded by the process known to chemists as elutriation. Emery was for a long time brought from the island of Naxos in the Grecian Archipelago. The Greek government granted a monopoly of its trade to an English merchant. In 1847, Dr. J. Lawrence Smith, an American explorer in the employ of the Turkish government, found deposits of the mineral at various points in Asia Minor, and the monopoly was destroyed and the price lowered. Deposits of emery have since been found in Bohemia, in the Ural Mountains, in Australia, and in North Carolina, Georgia, and Montana. The supply from these deposits is too small, however, to compete with that which is brought from Turkey and Naxos.

Engraving.—The engraving of gems is a branch of art of the highest antiquity. The earliest writers make mention of engraved seals and seal rings, and there still exist many antique engravings equal to later productions of similar artists. Engraving from plates and wood is chiefly of modern invention, having its origin about the middle of the fifteenth century. Engraving on glass was perfected to an art by Boudier of Paris, 1799. The art of engraving, especially in photographic processes, has made great progress in the United States during the past quarter century. Prints from engraved copper plates made their appearance about 1450, and were first produced in Germany. Masso is considered to have been the first Italian engraver, about 1440. Etchings on copper by means of aqua fortis is reputed to have been discovered by Francis Mazzuoli, about 1532. Etching was later practiced by Albert Durer, and most especially by Rembrandt. Its revival began about 1860. Mezzotints are said to have been discovered by Colonel Von Siegen, who engraved the portrait of Princess Amelia of Hesse in mezzotint, in 1643; it was improved by Prince Rupert in 1648; and by Sir Christopher Wren, about 1662. The mode of engraving on soft steel, which after it has been hardened will multiply copper plates and fine impressions, indefinitely, was introduced into England by Messrs. Perkins & Heath of Philadelphia, in 1819.

Entomology, the science of insects, is based upon the arrangements of Linnæus, A. D. 1739. The Entomological Society of London was instituted in 1833. A national entomological exhibition at the Westminster aquarium was opened March, 1878. Numerous chairs of entomology have been established in

colleges and universities in the United States and Europe within a recent period.

Etching, Art of.—About the middle of the fifteenth century Tomaso Finiguerra, a Florentine, introduced the art of etching. In Germany, Italy, and France its value met with prompt recognition, but it was not carried to a state of perfection till later times. It was at first regarded as an industrial art, but it soon grew to have a higher value, reproducing in graceful freedom and precision of touch the very feeling of the artist. The first step in etching is to cover the plate with a composition of wax, asphaltum, gum-mastic, resin, etc., dissolved by heat. An outline of the design, made on paper in pencil or red chalk, is then "transferred" to the surface of this composition by being passed through a press. The subject is then drawn on the ground with the etching point, which cuts through it and exposes the copper. Etching-points or needles resemble large sewing needles shortened and fixed into handles four or five inches long. Some are made oval, to produce broader lines. A rim of wax being put around the plate, acid is poured on, and corrodes the copper not protected by the ground. If the acid is found not to have acted sufficiently, it may be applied again to the whole design, or only to portions of it, by stopping up with a mixture of lamp-black and Venice turpentine, applied with a camel's-hair pencil, what has been sufficiently *bitten-in*. When a series of parallel lines are wanted, as in backgrounds, etc., an ingenious machine called a ruler is employed, the accuracy of whose operation is exceedingly perfect. This is made to act on the etching-ground by a point or diamond connected with the apparatus, and the tracings are bit in with *aqua fortis* in the ordinary way. The art of etching was popularized by Sandro Botticelli, who embellished an edition of "Dante" with etching illustrations about the end of the fifteenth century. The great German etchers of that time were Shoengauer, Bechellin, and Wohlgemuth, and the Italian representatives were Bacio Baldini, Pollajuoli, and Montegna. In the succeeding century Goltzius and others reproduced the works of the old masters, through etching, with wonderful mobility. Toward the latter end of the seventeenth century the art was carried to a high degree of perfection by Le Bas and by the Spanish school. Then, for a time, the art declined, its place being taken by steel engraving, which in turn gave way to the chromo, and that to the lithograph. The revival of the art in England is largely due to Philip Gilbert Hamerton. At that time Seymour Haden was the leading etcher in England, as was Count de Gravesande in France.

Whistler, the eccentric American, is now one of the leading lights in the art in England, and Hamilton Hamilton is probably the most popular etcher in America. Among the greatest of modern etchers are Salonne, Couteau, Waltner, Rajon, De Baines, and Koeping.

Ether was known to the earliest chemists. Nitric ether was first discovered by Kunkel, in 1681; and muriatic ether, from the chloride of tin, by Courtanvaux in 1759. Acetic ether was discovered by Count Lauraguais, same year; and hydriodic ether was first prepared by Gay-Lussac. The phosphoric was obtained by M. Boullay. Ether is said to have been first applied to the purpose of causing insensibility to pain by Dr. Horace Wells of Connecticut, in 1846. The discovery that by inhaling ether the patient is rendered unconscious of pain, is due to Dr. Charles T. Jackson, of Boston; but to Dr. Morton of the same place, probably belongs the credit of first demonstrating, by actual experiment, the use of ether in dentistry and surgery. The practice was first copied in Europe by Dr. Robertson, of Edinburgh, and Dr. Booth, of London, in 1846.

Ethnology is the science which treats of the division of man into races, with their origin, relations, and characteristics. Naturalists divide mankind, according to certain physical characteristics, into varieties, or races. Authorities differ greatly in this classification. Cuvier made three races; Pritchard, seven; Agassiz, eight, and Pickering, eleven; but the classification most commonly accepted is that into five races, as made by Blumenbach, as follows: The Caucasian, European, or white race; the Mongolian, Asiatic, or yellow race; the Ethiopian, African, or black race; the American Indian, or red race; the Malay, or brown race. The first three are much more clearly marked, and are considered by Guyot as primary races; the others, being modifications of these three, he designates as secondary races. Because of the blending of types, it is difficult to make a classification, hence the difference among authorities. The points on which the classification is based are mainly the size and proportions of the body, the shape of head and the features, the hair and beard, and the color of the skin.

The Caucasian race is characterized by tall stature, oval head and face, high forehead, regular features, abundance and softness of hair and beard, and usually fair skin, but in some it is tawny or swarthy, as in the Hindoos, Arabs, and others. This race stands at the head in intelligence and civilization. It is represented by the principal inhabitants of Europe and their descendants in America, and by the

inhabitants of India, Arabia, and of Western Asia and Northern Africa.

The Germanic nations are descendants of the numerous tribes of the ancient German stock that destroyed the Roman empire and erected different states upon its ruins.

The Romanic nations occupy Southern Europe, and are so called because their languages are mostly derived from the Latin spoken by the ancient Romans. They are mixed nations, descended partly from the ancient Pelasgians and partly from other branches of Aryan stock.

The Italians derive their origin from the Romans, German Longobards, and Normans, with a slight intermixture of the Arabic stock.

The Spanish and Portuguese have sprung from a mixture of Celts, Romans, Germans, and Arabs.

The Mongolian race are distinguished by short stature, round head, wide face, high cheek bones, obliquely set eyes, coarse, straight hair, scarcely any beard, and yellowish color of the skin. They are distributed over the whole of Eastern Asia, except in India, and include the Esquimaux of the northern part of North America.

The Ethiopian race are characterized by medium stature, generally ungainly form, low and retreating forehead, head full back of the ears, flat, broad nose, projecting jaws, thick lips, short, curly hair, and skin generally black or dark. They occupy all of Africa, except the northern part, and many of their descendants are found in America.

The American race resemble the Mongolian, but the head is not so round, the face less wide and flat, the eyes horizontal, the hair black and straight, and beard scanty and the skin a reddish or copper color. They occupy North and South America, except on the Arctic shores.

The Malay race resemble also the Mongolian, but have thicker lips, horizontal eyes, hairless straight, generally full beards, and color usually brown. They occupy the Malay peninsula and the islands of the Pacific and Indian Oceans.

Evolution Theory, The.—Ancient writers occasionally seemed to have a glimmering knowledge of the fact of progress in nature, but as a theory "evolution" belongs to the enlightenment of the nineteenth century. In the latter part of the seventeenth century Leibnitz expressed the opinion that the earth was once in a fluid condition, and about the middle of the eighteenth century Kant definitely propounded the nebular hypothesis, which was enlarged as a theory by the Herschels. About 1750 the transmutation of species among animals was suggested by Buffon, and other writers fol-

lowed out the idea. The eccentric Lord Monboddo was the first to suggest the possible descent of man from the ape, about 1774. The evolution theory declares the universe as it now exists to be the result of a long series of changes, which were so far related to each other as to form a series of growths analogous to the evolving parts of a growing organism. Herbert Spencer defines evolution as a progress from the homogeneous to the heterogeneous; from general to special; from the simple to the complex elements of life; and it is believed that this process can be traced in the formation of worlds in space, in the multiplication of types and species among animals and plants, in the origin and changes of language and literature and the arts, and also in all the changes of human institutions and society. Asserting the general fact of progress in nature, the evolution theory shows that the method of this progress has been (1) by the multiplications of organs and functions; (2) according to a definite unity of plan, although with (3) the intervention of transitional forms, and (4) with modifications dependent upon surrounding conditions. The two great apostles of the evolution theory were Charles Darwin and Herbert Spencer. The latter began his first great work, the "First Principles of Philosophy," showing the application of evolution in the facts of life, in 1852. In 1859 appeared Darwin's "Origin of Species." The hypothesis of the latter was that different species originated in spontaneous variation, and the survival of the fittest through natural selection and the struggle for existence. This theory was further elaborated and applied by Spencer, Darwin, Huxley, and other writers in Europe and America; and though, to-day, by no means all the ideas upheld by these early advocates of the theory are still accepted, still evolution as a principle is now acknowledged by nearly all scientists. It is taken to be an established fact in nature—a valid induction from man's knowledge of natural order.

Facts as to Sound.—In air, sound travels from 1,130 to 1,140 feet per second. In water, it passes at the rate of 4,700 feet per second. A bell sounded under water may be heard under water at 1,200 feet distance. Sounds are distinct at twice the distance on water that they are on land. On Table Mountain, a mile above Cape Town, every noise in it, and even words, may be heard distinctly. Dr. Jamieson says that in calm weather he heard every word of a sermon at the distance of two miles. The sound of a tuning fork may be distinctly heard at a distance of 200 yards, by connecting the stem by pack threads with the ear.

Fire is said to have been first produced by striking flints together. The poets supposed that fire was stolen from heaven by Prometheus. Heraclitus, about 500 B. C., maintained that the world was created from fire, and deemed it to be an omnipotent God; Zoroaster, king of Bactria, was the founder of the sect of the Magi, or worshipers of fire, still numerous in the countries of the East, 2115 B. C. In the Scriptures, God is said often to have appeared in fire, or was encompassed by it,—as in the burning bush at Mt. Horeb. The wrath of God is described as a consuming fire, and the angels, as his ministers, are compared to it.

Fire Engines, to force water, existed in very ancient times. The first of the kind now in use, but of a vastly inferior character, was invented by two Dutchmen, each named Jan Van der Heide, at Amsterdam, in 1518. In 1657, an improved engine was introduced at Nuremberg by John Hantsch. Fire engines were first known at Paris in 1699. The first volunteer fire company in America was the Union of Philadelphia, about 1736.

First Railroads.—The first railroad ever built for general traffic was the Stockton and Darlington in England, which was thirty-seven miles long, constructed in 1825 by Edward Pease and George Stephenson. In 1825 a railroad was projected in America by Gridley Bryant, but it was not constructed until two

years later, when Bryant secured the assistance of Col. T. H. Perkins in the enterprise. This road was three miles long, and was used for carrying granite for Bunker Hill monument from the quarries in Quincy, Mass., to tide water. In 1827 the Mauch Chunk Railway, a coal road, nine miles long, was built, and February 27 of the same year the Maryland Legislature granted a charter to the Baltimore and Ohio road. The first locomotive which proved of practical value was invented by George Stephenson, the celebrated English engineer, and was used on the Stockton and Darlington Railway. In 1829 a railway line was completed between Liverpool and Manchester, of which Stephenson was the principal engineer, and for this road he constructed the engine known as the Rocket, which accomplished the speed of fourteen miles an hour. The first locomotive built in America was used on the South Carolina Railroad—the first road in America built for use of steam locomotives.

Flies Walking on the Ceiling.—For a long time it was supposed that the ability of the fly to walk on the ceiling was owing to each of his feet being a miniature air-pump. This, however, was proved to be fallacious, and then a theory was propounded that it was by means of a viscous substance exuded from the hairs on its feet. Some twenty years or so ago this theory was thoroughly investigated by Dr. Rombouts, who demonstrated that it was only partly sound; for, though the hairs with which the foot-cushion is covered do certainly exude an oily liquid, the liquid is not sticky, and does not harden when dry. Dr. Rombouts proved by his experiments that the true theory of the walking of flies on smooth substances is that they hang on by the help of capillary adhesion—the molecular attraction between solid and liquid bodies. By a series of nice calculations, such as weighing hairs and measuring their diameters, and sticking the cut end of hair in oil or water to make it adhere when touched to glass, this scientist proved that capillary attraction would uphold a fly were it four ninths as heavy again as it is at present. It is true that the foot-hairs are very minute, but as each fly is said to be furnished with 10,000 to 12,000 of these, we need not be surprised at what they can do. Reasoning from this theory, we would conclude that flies find it difficult to mount a glass slightly dampened, because of the repulsion between the watery surface and the oily liquid exuding from the feet; and they are likewise impeded by a slight coating of dust, because the interspaces between the hairs are filled with dust, and observation seems to show this to be the case. When we see a fly making his toilet, he

is not, as we might suppose, cleaning his body, but his feet, so that they may the more readily adhere.

Forks were in use in Europe in the thirteenth and fourteenth centuries, though this is disputed as being too early. In Moryson's "itinerary" it is said that at Venice each person was served (besides his knife and spoon) with a fork to hold the meat while he cuts it, for there they deem it ill manners that one should touch it with his hand. Thomas Coryate, an Englishman, describes with much solemnity, the manner of using forks in Italy, and adds, "I myself have thought it good to imitate the Italian fashion since I came home to England," 1608. Two pronged forks were made at Sheffield soon after. Three pronged forks are more recent. Silver forks, previously only used by the highest classes, came into general use in England about 1814.

Galvanized Iron is merely ordinary iron which has been dipped in molten zinc and retains a surface coating of the zinc when removed. It has come to be of great importance and usefulness, as by this simple process any article may be made to combine the strength and cheapness of iron, and yet be entirely free from rust, as the zinc is unaffected by air or water, oxidizing only at a high temperature.

Gasoline is the lightest volatile liquid product, commonly obtained from the distillation of petroleum. It is used as fuel in vapor-stoves, and for carbonizing the air or water-gases in gas machines or carburetors. Air gas is simply air impregnated with the vapor of gasoline. Previous to 1836 it was made by passing air over benzol made from coal tar. The cost of benzol was at first a great obstacle, but the discovery of petroleum rendered it possible to make air gas cheaply. The machines used for making this gas include a "generator," a large vessel more or less complicated in construction, in which a quantity of liquid petroleum or naphtha is exposed for evaporation. A current of air is introduced, which mingles with the distilled vapor and forms air gas. This is a dangerous substance, as it bursts into flame with a sharp explosion upon contact with fire. If the generator, however, is placed at some distance from the point where the gasoline is to be used, conveying it thither in air-tight pipes, the danger is removed. Gasoline is extensively used for the lighting of hotels, factories, and private residences in small towns or rural districts.

Geography.—The first correct record we have of geographical knowledge is from Homer. He describes the shield of Achilles as representing the earth surrounded by the

sea, and also the countries of Greece, islands of the archipelago, and the site of Troy. The priests taught that the temple of Apollo at Delphos was the center of the world. Anaximander of Miletus was the inventor of geographical maps, about 568 B. C. Hipparchus attempted to reduce geography to a mathematical basis, about 135 B. C. Strabo, the Greek geographer, lived 71-14 B. C. Ptolemy flourished about 139 A. D. The science was brought to Europe by the Moors of Barbary and Spain about 1240. Maps and charts were introduced into England by Bartholomew Columbus to illustrate his brother's theory respecting a western continent, 1489. Geography is now divided into mathematical, physical, and political, and its study has been greatly promoted during the present century by expeditions at the expense of various governments and societies. There are in the world about sixty-five geographical societies.

Geologic Ages, The.—There are seven great geologic ages, or divisions of time, known as the Azoic, the Silurian, the Devonian, the Carboniferous, the Reptilian, the Mammalian, and the Age of Man. Our knowledge of the plants and animals of the ages preceding the creation of man is derived from their remains dug out of the earth, and called fossils.

The Azoic Age is the era, as its name implies, when there was no life, either vegetable or animal, on the globe. The crystalline minerals and all the igneous rocks date back to this age, and hence they are destitute of fossils.

During the Silurian Age, the second in antiquity, there was no terrestrial life; but mollusks—animals with soft, fleshy bodies, without any internal skeleton, like the oyster and the snail—abounded in the waters. The oldest sandstone and limestone belong to this period. Its plant fossils are sea weeds.

The Devonian Age was the age of fishes, remarkable for their thick, bony scales. The sea also teemed with shells, corals, and sea weed; while the land, though yet limited in extent, began to be covered with vegetation. Insects, the earliest of terrestrial animals, now first appeared.

The Carboniferous Age, or age of coal, is fourth. From colossal tree ferns, leaves, and branches, deposited in successive centuries, were formed, by gradual decomposition under water, those vast coal beds on which the industrial pursuits of the present day so largely depend. The animals of this age consisted mainly of insects of various kinds; and inferior tribes of reptiles.

The Reptilian Age was marked by the great number, variety, and size of its reptiles, the

appearance and habits of which are known from the remains, found buried in the rocks of this period. The rocks of this age are the freestones, extensively used for building, sandstone formations, intersected with ridges of trap of igneous origin, limestone and gypsum, laminated and plastic clays, and chalk beds, containing layers of flint.

The Mammalian Age was the sixth. The reptiles now dwindled in size and diminished in number, being succeeded by quadrupeds, some of which were much larger than any modern species. The deinotherium, mastodon, megatherium and fossil elephant were among the gigantic animals of this era, while the plants resembled those of the present time, palms, oaks, maples, magnolias, etc., being found in the forests.

The Age of Man is the last of the seven geologic ages. The huge monsters that gave the preceding period its peculiar character became extinct, and were replaced by smaller animals—those we see around. Man was created, and invested with dominion over the earth. This is the "era of the finished world—the era, also, of man's progress and preparation for another and a higher life."

Geometry.—Its origin is ascribed to the Egyptians; the annual inundations of the Nile having given rise to it by carrying away the landmarks, and the boundaries of farms. Thales introduced geometry into Greece, about 600 B. C. The doctrine of curves originally attracted the attention of geometers from the conic sections, which were introduced by Plato about 390 B. C. Euclid's elements were compiled about 280 B. C. Geometry was taught in Europe in the thirteenth century. Books on the subject of geometry and astronomy were destroyed in England in 1552, being regarded as infected with magic. The science was greatly improved and augmented by Sir Isaac Newton and LaPlace.

Geysers are intermittent, spouting, hot springs, and have a temperature at the boiling point. They are found in Iceland, New Zealand, and in the "National Park" at the head waters of the Yellowstone River in the Rocky Mountains.

The most celebrated is the Great Geyser of Iceland. It consists of an immense well, or funnel, 10 feet wide at its mouth, and about 70 feet deep, surmounted at the surface with a basin 65 feet in diameter and 7 feet deep, formed by the deposit of mineral matter from the water. At intervals it sends up a column of water and steam to the height of 100 feet. More remarkable even than the geysers of Iceland are some that are found in the "National Park." One, the Giantess, throws water to

the height of 200 feet. Grasshoppers and other insects, and pieces of wood which fall into the waters, soon become incrustated with quartz, which is held in solution by the water, thus permanently petrifying them.

Glacial Period is a term used in geology to designate the period when the greater part of the northern hemisphere was enveloped in one great ice-sheet. This period belongs to the post-tertiary or later formations, in the geological succession, and is important in its relations to the general question of the earth's history, and especially to the appearance of man upon the earth. Geologists are generally agreed that long before the advent of man, parts of the northern hemisphere were elevated several thousand feet higher than they are at present, causing the cold of the Arctic zone to extend far southward into present temperate regions, and that a vast glacier rising in the vicinity of Hudson Bay covered the American continent north of the fortieth parallel. The loose soil which covers so large a part of the surface of the northern continent to a depth varying from thirty to one hundred feet, over which lie the vegetable deposits of later ages, is considered by geologists the effects of glaciers that in the quaternary or latest geological age slowly moved southward across the country. Upon examination it is found that the erratic boulders scattered over the western prairies and other northern regions are unlike the native rocks of the same regions, being entirely foreign to the localities where they now appear. Sometimes the nativity of the rock is traced hundreds of miles north of where it now rests, showing that some powerful agency has carried it southward. Again, if the native rock be uncovered and closely examined, it will be observed to be polished and grooved with parallel marks, running north and south, as if chiseled out by some coarse and heavy instrument. These marks are attributed to sharp, hard rocks projecting through the lower surfaces of the glaciers. That glaciers do produce such markings is proved by examination of the rocks which the moving ice-fields of Switzerland and other glacial regions have worn and are marking to-day; also, the general appearance of the loose, unstratified, heterogeneous deposit is similar to that of the moraines that the modern glaciers leave as they slowly melt away. In New York and other Eastern states, the rocks are scratched from a northwesterly direction, in Ohio from a northerly direction, showing in each state the direction of the origin of the glacier. Scotland, Ireland, and the major portion of England, were enveloped in this great ice-sheet, and Scandinavia was invested with

a sheet of ice which filled up the Baltic and extended into Northern Germany. The Glacial Period, or Ice Age, as it is also called, is estimated to have begun upward of 200,000 years ago, and lasted for 160,000 years.

Glass.—The Egyptians are said to have been taught the art of making glass by Hermes. Pliny says the discovery of glass took place in Syria. Glass houses were erected in Tyre, where glass was a staple manufacture for many ages. This article is mentioned among the Romans in the time of Tiberius; and it is known from the ruins of Pompeii, that windows were formed of glass before A. D. 79. Italy had the first glass windows, next France, whence they came to England. Used for windows in private houses in the reign of Henry II. of England, 1177, but imported. The manufacture was established in England at Crutched-Friars in 1557. It was improved, 1635, and was brought to great perfection in the reign of William the Third. Plate glass for coach windows, mirrors, etc., was made at Lambeth by Venetian artists, 1673. The manufacture was improved by the French, who made very large plates; and further improvements have been made in Lancashire, England, and the United States.

Glass, Discovery of.—There is comparatively little known in regard to the invention of glass. Some of the oldest specimens are Egyptian, and are traced to about 1500 years before Christ (by some, 2300 B. C.). Transparent glass is believed to have been first used about 750 years before the Christian era. The credit of the invention was given to the Phœnicians by the ancient writers. The story of the Phœnician merchants who rested their cooking-pots on blocks of natron (subcarbonate of soda), and found glass produced by the union, under heat, of the alkali and the sand on the shore, is a familiar one. The world no doubt owes the art of glass-making to the Egyptians. It was introduced into Rome in the time of Cicero, and among the Romans attained a high degree of perfection. Some of the most beautiful specimens of glass ever manufactured were made in Rome before the Christian era; as, for instance, the exquisite Portland vase in the British Museum. During the middle ages the Venetians were the most famous makers of fine glassware, and after them the Bohemians. Though the art of making glass and blowing it into all kinds of shapes was known so early, this material does not seem to have been used for windows until about A. D. 300.

Glucose, termed also grape sugar, starch sugar, and diabetic sugar, is a natural organic compound, consisting of carbon, hydrogen,

and oxygen. It is found to some extent in the animal kingdom and very largely in the vegetable kingdom, being a constituent of the juice of almost all sweet fruits and vegetables. The name "diabetic" is due to its large occurrence in the urinary secretion and other fluids of the body in the disease called diabetes. It is manufactured in large quantities from starch and is used in the manufacture of beer and a coarse kind of alcohol. It is in taste much the same as ordinary sugar, but less sweet. It has a peculiar effect upon a ray of polarized light, passing through it; and there are two varieties comprising fruit sugar, one of which turns the plane of polarization to the right, and is called dextro-glucose, and the other turning the plane of polarization to the left, and called lævo-glucose, or dextrose and lævulose respectively.

Grain.—The origin of its cultivation is attributed to Ceres, who, having taught the art to the Egyptians, was deified by them, 2409 B. C. Corn, or grain, provided a common article of food from the earliest ages of the world. The first importation of corn into England of which we have any knowledge was in 1347, though it was introduced into Britain in the sixth century.

Graphite.—The name is derived from the Greek *graphein*, to write. It is also commonly but incorrectly called black lead and plumbago. It contains no lead, but is an allotropic form of carbon, and therefore identical in composition with charcoal and diamonds. It occurs as a mineral, both massive and disseminated through the rock, generally in granite, gneiss, mica schist, and crystallized limestone. It is also a product in the destructive distillation of coal, and can be artificially obtained by other methods in the laboratory. It is lighter than water, and this property is made use of in separating it from the rock in which it is found. The ore is pulverized and then thrown into large, shallow tanks; the particles of rock sink, while the particles of graphite float and are taken from the surface free from the rock, and are formed into solid blocks by great pressure. The mine at Burrowdale, in Cumberland, England, has been known since the time of Queen Elizabeth and probably furnished the first lead pencils ever made, but became exhausted many years ago. Large deposits of graphite have been found in the northeastern part of Siberia, and in Germany, France, Austria, and in several portions of the United States. Its most important use is in the manufacture of lead pencils. But, as it is infusible and a good conductor of electricity, it has found other important applications, as for crucibles and

the linings of small furnaces, and in the process of electrotyping. It is unctuous to the touch and has a high metallic luster, and is used also in polishing and lubricating compounds, but for this latter purpose has been found too hard to be satisfactory.

Graphophone.—This instrument is, in its essential features, identical with Edison's phonograph. [See *Phonograph*.] The graphophone now in experimental use is the invention of Mr. Sumner Tainter, aided by Professor Bell. In a correct nomenclature the phonograph would represent a machine for making a record of speech, the record made would be termed a phonogram, and the graphophone would be a machine for reproducing speech from the phonogram. The words are all derived from the same two Greek roots, which mean "write" and "speak."

Gravitation, as a supposed innate power, was noticed by the Greeks, and also by Seneca, who speaks of the moon attracting the waters, about 38 A. D. Kepler investigated the subject about 1615; and Hooke devised a system of gravitation about 1674. The principles of gravity were demonstrated by Galileo, at Florence, about 1633; but the great law on this subject, laid down by Newton in his *Principia*, in 1687, is said to have been proved by him, in 1670. His attention was directed to the subject by the fall of an apple from a tree, in 1666. In 1867, M. Chasles laid before the Paris Academy of Sciences some letters alleged to have been written by Newton to Pascal and others tending to show that to Pascal was due the theory of gravitation. The authenticity of these letters was denied and their forgery afterward shown.

Guillotine, the instrument of decapitation was introduced during the French Revolution by the Convention, and named after its supposed inventor, Joseph Ignace Guillotin, a physician, who, however, was only the person who first proposed its adoption. It was erected and first employed to execute a highwayman on the Place de Grève, Paris, 25th April, 1792. It is composed of two upright posts, grooved on the inside, and connected at the top by a cross-beam. In these grooves a sharp iron blade, having its edge cut obliquely, descends by its own weight on the neck of the victim, who is bound to a board laid below.

Gun-Barrels.—The finest musket-barrels are made of iron which contains a portion of steel, or undergoes some steeling process. Laminated, twisted, or Damascus steel is used in the manufacture of the best barrels. Scraps of saws, steel pens, files, springs, and steel tools are collected from various workshops, for the material of laminated steel. These are

cut in small and nearly equal pieces, cleansed and polished by revolving in a cylinder, fused into a semi-fluid state, and gathered into a "bloom" or mass. This bloom is forged with a three-ton hammer, and hardened and solidified with a tilt-hammer. It is then rolled into rods, each rod is cut into pieces six inches long, and these pieces are welded together. The rolling, cutting, and welding process is then repeated several times, and thus finally the metal is brought into a very hard, tough, fibrous, and uniform state. Twisted steel for barrels is made by taking thin plates of iron and steel, laying them alternately one on another in a pile, welding them by heat and hammering, and twisting them by very powerful mechanical agency until there are twelve or fourteen complete turns to an inch. The length becomes reduced one half and the thickness doubled by this twisting. Barrels made of Damascus steel are manufactured of steel which has undergone a still further series of welding and twisting operations. Some barrels are made of a mixture of old files with old horseshoe nails; these are called stub Damascus barrels. The files are heated, cooled in water, broken with hammers, and pounded in a mortar into small fragments. Three parts of these fragments are mixed with five of stub and the mixture is fused, forged, rolled, and twisted. An inferior kind of Damascus twist is made by interlaying scraps of sheet iron with charcoal and producing an appearance of twist, but without the proper qualities. Inferior kinds of barrel-iron are known as "three-penny-skelp" and "twopenny skelp"; but the worst of all is "sham-dam skelp." The finest barrels are all twisted in form. The skelps, or lengths of prepared steel, are twisted into a close spiral a few inches long; several of these spirals are welded end to end, and the fissures are closed up by heating and hammering. The rough barrel, with a core or mandrel temporarily thrust in it, is placed in a groove and hammered cold until the metal becomes very dense, close, strong, and elastic. The interior is then bored truly cylindrical by a nicely adjusted rotating cutting tool. If, on close inspection, the interior is found to be straight and regular, the exterior is then ground on a rapidly revolving stone and finally turned in a lathe. The skelps for the commoner barrels are heated, laid in a semi-cylindrical groove, hammered until they assume the form of that groove, placed two and two together, and heated and hammered until one barrel is made from two halves. These are browned externally with some kind of chemical stain. The finest barrels are rubbed externally with fine files and polished with steel burnishers.

Gunpowder, Discovery of.—It is generally conceded that gunpowder was used by the Chinese as an explosive in prehistoric times. When they first discovered or applied its power as a propellant is less easily determined. There is an account of a bamboo tube being used, from which the "impetuous dart" was hurled a distance of 100 feet; this was at a very early period, but it is difficult to say precisely when. It is alleged, however, that in the century before the Christian era a cannon was employed bearing the inscription, "I hurl death to the traitor and extermination to the rebel." It has also been asserted that India has equal claims with China to the first acquaintance with gunpowder. The ancient Sanskrit writings appear to point very plainly to the operation of some primitive sort of cannon, when, in recording the wars of the Egyptian Hercules in India, it is stated that the sages remained unconcerned spectators of the attack on their stronghold till an assault was attempted, when they repulsed it with whirlwinds and thunders, hurling destruction on the invaders; and a Greek historian of Alexander's campaign testified that the Hindoos had the means of discharging flames and missiles on their enemies from a distance. According to Meyer, the preparation of gunpowder was described by Julius Africanus, A. D. 215. In 1073 King Solomon of Hungary bombarded Belgrade with cannon, and in 1085 the ships of Tunis, in the naval battle near Toledo, were said to shoot "fiery thunder." All of which would go to prove that the custom of ascribing the discovery of gunpowder to Bertholdus Schwartz in 1330, or even to Roger Bacon in 1267, is open to considerable objection, although these men probably introduced it in European warfare.

Gutta-Percha.—The name "*gutta-percha*" is Malayan, *gutta* signifying the concrete juice of a plant, and *percha* the name of the particular tree from which it is obtained. It is the dried milky juice of the tree which is found in the peninsula of Malacca and the Malayan Archipelago. Its use was first discovered by Europeans about 1843. It is imported in blocks and lumps of five to ten pounds weight in various forms, chiefly like large cakes, or rounded into gourd-like lumps. It has a cork-like appearance when cut, and a peculiar cheese-like odor. Before it can be used it has to undergo some preparation. This consists in slicing the lumps into thin shavings, which are placed in a *deviling* or tearing machine revolving in a trough of hot water. This reduces the shavings to exceedingly small pieces, which, by the agitation of the tearing teeth, are washed free from many impurities,

especially fragments of the bark of the tree, which, if not separated, would interfere with the compactness of its texture. The small fragments, when sufficiently cleansed, are kneaded into masses, which are rolled several times between heated cylinders, which press out any air or water and render the mass uniform in texture. It is then rolled between heated steel rollers into sheets of various thicknesses for use, or is formed into rods, pipes for water or speaking tubes, and an endless number of other articles. The great value of gutta-percha arises from the ease with which it can be worked, and its being so complete a non-conductor of electricity. It softens in warm water, and can be molded into any form in that state, as, when soft, it is not sticky, and turns well out of molds.

Hats and Caps.—A covering for the head was early adopted by the inhabitants of northern climes, and was usually a hood made of fur; but it was not until the Phrygians had conquered Asia Minor that the people of warmer latitudes wore any head-covering. The Phrygians were the first to adopt the fashion, and they did it in order to distinguish themselves from the conquered race with whom they lived. Their head-dress was a small, close-fitting cap, which was also soon adopted by the Roman free citizens. In 1404 a Swiss manufacturer of Paris invented the first hat.

Hearse.—The word "*hearse*," or *herse*, is of French origin, and means a harrow or frame for setting candles in, and was originally applied to a bar or framework with upright spikes for the reception of candles; and it was used at the ceremonies of the Church and at funeral services. In the fifteenth and sixteenth centuries hearses of great splendor came into use, and were erected in the churches over the bodies of distinguished personages. The framework was of iron or brass, sometimes of beautiful workmanship, square, octagonal, etc., in plan, with pillars at the angles, and arched framework above forming a canopy. The whole was hung over with rich cloths and embroidery, and lighted up with hundreds of wax candles and decorated with wax images. From this the transition to the modern hearse can easily be traced. In Roman Catholic churches of the present day the hearse still exists as a triangle with spikes on which candles are placed.

Heliography.—The idea of first conveying signals by means of mirrors, which is the meaning of heliography, is said to have been employed by Alexander the Great, 333 B. C. The heliostat, an instrument invented by a Hollander early in the eighteenth century, and the heliograph, invented by Mr. Mance in 1875.

have both been used by the British army in their Eastern campaigns. The instruments differ somewhat in construction, but the result arrived at is the same in both. Signals are produced by causing a reflected ray of the sun to appear and disappear alternately at a distant point, the intervals of appearance and obscuration being carried in length so as to produce the combination of long and short signals, known as the Morse alphabet. The reflecting body is a glass mirror which varies in size according to the distance to which it is desired to signal. A five inch mirror has given, when atmospheric conditions were favorable, distinct signals at a distance of sixty miles. The heliograph has also been found of great service in defining distant points for large surveys, and was used for verifying the arc of the meridian by the astronomers at the Cape of Good Hope.

Horse Power of Steam Engines.—The unit of nominal power for steam engines, or the usual estimate of dynamical effect per minute of a horse, called by engineers a "horse power," is thirty-three thousand pounds at a velocity of one foot per minute, or, the effect of a load of two hundred pounds raised by a horse for eight hours a day, at the rate of two and a half miles per hour, or 150 pounds at the rate of 220 feet per minute.

RULE.—Multiply the area of the piston in square inches by the average force of the steam in pounds and by the velocity of the piston in feet per minute; divide the product by thirty-three thousand, and seven tenths of the quotient equals the effective power.

Human Family, The.—The three primary divisions of man, as indicated by Latham, are the Indo-European, the Mongolian, and the African.

I. THE INDO-EUROPEAN OR CAUCASIC race originally extended from India across Europe, and, increasing ever in civilization and intellectual power from age to age, has become the dominant one in the world, extending its influence to every part of the earth, supplanting many inferior races, and repeopling wide areas, as in America and Australia.

The Caucasian race comprises two principal branches—the Aryan and the Semitic. A third branch, according to M. de Quatrefages, includes the Caucasians proper, Euscarians (Basques), and others.

Most of the inhabitants of Europe belong to the Aryan Family; they are arranged in the following groups:—

1. The Keltic, in the N. W., comprising the Welsh, Gaels, Erse, Manx, and Armoricans.

2. The Italic, chiefly in the S. W. and S., comprising the Italian and other Romance

nations—French, Spanish, Portuguese, Roumanesch, and Roumanians.

3. The Thraco-Hellenic, in the S. E., Greeks, and Albanians.

4. The Teutonic, in the N. N. W. and center, comprising the Germans, Scandinavians, Danes, Icelanders, Dutch, Flemings, English.

5. The Lithuanian, S. E. of the Baltic.

6. The Slavonic, in the E., comprising the Russians, Poles, Tsekhs, Serbs, Croats, Bulgarians, etc.

The Indo-European or Caucasian race in Asia comprises the Hindoos, Baluchis, Afghans, Iranians (Persia), Galchas (Zarafshan), and the Semitic tribes of Armenia, Syria, Arabia, etc.

II. THE MONGOLIAN is divisible into three branches, according to geographical position, which again form numerous smaller families.

1. The Asiatic, comprising the Mongolians of the Chinese Empire, India, and Indo-China; the Kalmucks, adjoining the Turks, who extend from Southern Europe far into Central Asia; the Magyars of Hungary; the Yakuts and Samoeds (or Samoyedes) of Siberia; with the Lapps, Finns, and various tribes of East Europe.

2. The Oceanic Mongolians are composed of two classes. 1. The black-skinned found in New Guinea, Australia, Tasmania, and the islands between New Zealand, and New Caledonia. II. The yellow, olive, or brown race, occupying New Zealand, the Malay Peninsula, Sumatra, Borneo, Java, Moluccas, Philippines, Madagascar, etc.

3. The American Mongolians comprise a large number of tribes, the chief of which in North America are—the Athabaskans, Algonkins, Sioux, Paducas, and Mexicans. In South America, the Quichuas, Chilians, and Patagonians extend along the west coast. The Caribs, Maypures, Brazilians, Moxos, and Chiquitos occupy the north, east, and center of the continent. The Eskimos form a connecting link between the Asiatic and American branches of this family.

III. THE AFRICAN, forming the third great division of the human race, is exhibited in its purest form by the natives of Western Africa. The Negroes occupy the whole central portion of the country from Cape Verde on the west to Khartoom on the east, and south to the Congo. South of the Negroes are the Bantus (including the Kafirs), inhabiting the greater part of Africa between the 4th parallel of N. lat. and the Cape. In the S. W. are the Hotentots. Certain dwarfish tribes are found in different parts of the continent, as the Bushmen of the Kalahari Desert, the Obongo of Ogowe basin and others. The Fulas and Nu-

bas occupy parts of the Soudan; the former, in the N. W., extend from the Senegal and Niger towards Lake Tchad; the latter are found in Nubia, Kordofan, Darfur, etc. The Gallas, Copts, Somali, of the Sahara, Egypt, and East Africa; the Abyssinians; and the Berbers, Kabyles, Tuareks and other tribes of North Africa, belong to the Hamitic race, which is closely allied to the Semitic race. The latter is represented by the Arabs of the N. coast, and of the Arabian Peninsula, and by the Tigres and other tribes of Abyssinia.

Hypnotism is a method for the alleged cure of disease, by the concentrated action of the mind upon the body while in a state of trance, induced by causing the patient to fix his eyes and concentrate his mind upon a disc of bright metal held at a distance of about twelve inches above the level of the eyes. The first effort to investigate hypnotism in a scientific manner was made by James Braid, of Manchester (1846), from which circumstance hypnotism is sometimes called Braidism. The power to hypnotize is possessed only by persons of peculiar mental organization. While in the hypnotized condition, which renders them insensible to pain, patients may be operated upon for surgical or medical purposes, the patient being entirely subject to the will of the hypnotizer. Hypnotism can, however, only be considered as of quasi medical utility, though investigation is being made with the view to placing it on a sound scientific basis.

Igneous Rocks are those which have been produced from materials fused by heat. They differ from the sedimentary rocks in their origin, structure, and position. They invariably come from below upward, breaking through the older rocks, and are generally ejected in a melted state from volcanic vents, or from fissures opened to some seat of fires within or below the earth's crust. The materials of sedimentary strata are fragments of pre-existing rocks worn by the action of water either into a fine mud or into rounded particles of greater or less size; whereas igneous rocks exhibit either a vitreous structure, as when they have been quickly cooled, or a granular structure composed of more or less minute crystals, according to the rate of cooling, or a vesicular structure when they have been expanded by the contained gases, or by being brought into contact with water. In position, also, they may be distinguished from the sedimentary rocks, very seldom occurring regularly stratified with parallel upper and under surfaces, but generally local, thinning out into wedge-shaped beds, or having that irregular stratification which may be seen in modern lava. They are also found as upright walls

and columns, of which the famous Giant's Causeway and Fingal's Cave are notable examples. Igneous rocks when filling a narrow fissure in an older stratum, and also when spreading beyond the fissure and forming an extensive superstratum, are called a dike. The rocks above mentioned are dikes, as are also the Palisades on the Hudson, Salisbury Crags near Edinburgh, many rocks around Lake Superior, over the western slope of the Rocky Mountains, and numerous other localities. The outflow in some cases has been very large, the lava floods of Oregon, Nevada, and northern California being estimated to comprise a total area of not less than 200,000 square miles, with a maximum thickness of 3,500 feet, the average being probably 2,000 feet. The most common rocks of dikes are dolerite (often called trap) and peridotite; both sometimes called basalt when not granular in texture.

Ignis-Fatuus.—A number of theories have been advanced in explanation of the luminous appearance which is frequently seen in marshy places, church yards, and stagnant pools, and which is known as ignis-fatuus. Of these it is only necessary to mention two. The first is that the ignis-fatuus is due to phosphureted hydrogen gas, which possesses the power of spontaneous ignition on coming in contact with dry atmospheric air; the gas would be generated by the decomposition of animal matter present in a marshy soil. The motion of the ignis-fatuus (it floats in the air at about two feet from the ground, is sometimes fixed, and sometimes travels with great rapidity) is accounted for by the flame being communicated along the line of a stream of gas. The second is that it is due to the combustion of light carbureted hydrogen gas arising from the decomposition of vegetable matter; but, though this supposition satisfactorily accounts for many appearances connected with the ignis-fatuus, the gas itself is not spontaneously combustible, and an additional supposition requires to be made to account for its ignition. The ignis-fatuus generally appears a little after sunset as a pale, bluish-colored flame, varying in size and shape; sometimes it shines steadily till morning, at other times disappears and reappears within about half-hourly intervals. In general it recedes on being approached, and *vice versa*, though several successful attempts have been made to light a piece of paper by it. In former times, under the names of *Will-o'-the-Wisp*, *Jack-o'-Lantern*, *Spunkie*, etc., it was an object of superstition among the inhabitants of the districts where it appears, and was believed to be due to the agency of evil spirits attempting to lure the

traveler to his destruction; and unfortunately there are many instances on record of travelers mistaking the *ignis-fatuus* for a lamp, and being thus decoyed into marshy places, where they perished. The *ignis-fatuus* is not a common phenomenon, but it is not unfrequently seen in the north of Germany, the swampy and moorland districts in the south and north-west of England, and in the lowlands of Scotland.

Important Origins.—*Air Balloons*, invented by Gusmac, a Jesuit, in 1729. Revived in France by M. Montgolfier, in 1783.

Air Guns, invented by Guhr, of Nuremberg, in 1656.

Arquebus, introduced about 1520, and remained in use until after 1567, when the matchlock supplanted it. In 1680 the flint lock was invented, and the musket was introduced.

Banking.—The first bank in Europe was the Bank of Venice, 1171. The Bank of England was established in 1694, the Bank of North America, 1781.

Barometers, invented in 1626; wheel barometers in 1668, phosphoric in 1675, pendent in 1695, and marine in 1700.

Battering Ram, invented 441 B. C.

Bayonets, invented at Bayonne, in 1670. First used in England in 1693. At first these had wooden handles fitting into the guns, but in 1699 the socket bayonet was introduced.

Bellows.—Strabo informs us that the invention of bellows is due to the Scythian philosopher, Anacharsis, who lived in the time of Solon.

Bombs, invented at Venlo, in 1588, and used first in the service of France, in 1634.

Bridges. The first bridge of stone in England was that built at Bow, near Stratford, in 1087.

Bullets of stone used in 1514. Iron bullets first mentioned in 1550.

Camera Obscura, invented by Baptista Porta, in 1515.

Chain Shot, invented by DeWitt, Dutch Admiral, in 1666.

Chimneys, first introduced in England, in 1200, but at first only in the kitchen or large hall.

China, made at Dresden, in Saxony, in 1706; at Chelsea (England) in 1752; by Mr. Wedgwood in 1762.

Chronograph, A, is an instrument noting time within the fraction of a second. By the electrical chronograph used by astronomers, the transit of a star can be recorded to within one hundredth of a second.

Chronometer, The, is an instrument for measuring time, now generally applied only to

those watches specially made for determining longitude at sea. A chronometer which gained a prize of \$100,000, offered by the British Board of Longitude for a timepiece to ascertain longitude within thirty miles, was made in 1761, by John Harrison of Foulby, near Pontefract.

Clepsydra, The, is an instrument to measure time by the trickling or escape of water. In Babylonia, India, and Egypt, the clepsydra was used from before the dawn of history, especially in astronomical observations.

Clocks are of ancient date, one having been made by Pacificus, archdeacon of Verona, in the ninth century. Clocks with wheels were used in monasteries about the twelfth century, and were made to strike the hour. Pendulum said to have been first applied by Harris, 1641; dead-beat pendulum invented 1700, and the compensating pendulum, 1715.

Coal Mines, discovered in the neighborhood of Newcastle about 1234. Coals were first used in London in the reign of Edward I., when the smoke was supposed to corrupt the air to such an extent that he forbade the use of them by a proclamation, 1273; first brought from Newcastle to London, 1381.

Coffee introduced into Arabia Felix, 1454; became known at Constantinople and coffee houses opened, 1554; brought to Marseilles, 1644; the art of roasting and making it introduced at London by a Greek servant, and house opened in Georgeyard, Lombard street, 1652.

Cosmos is a term used to denote the order and harmony of the universe. Originally used by Homer to denote "order," it was applied by Heraclitus and Anaxagoras to the divine order and arrangement of nature; by Plato to celestial and terrestrial order. It was further applied to the habitable world and the world generally as an orderly system.

Delf (or Delft) earthenware invented at Firenze in 1450.

Envelopes for letters are mentioned by Swift, 1726. Stamped adhesive envelopes came into general use shortly after the establishment of the penny postal system in 1840. Machinery for their manufacture was patented in 1844; many improvements have since been made.

Express.—The first American express was opened between New York and Boston, in 1821, by W. F. Harnden.

Figures, in arithmetic, introduced into Europe by the Saracens from Arabia, 991; till then, letters were used.

Flag.—The American flag was first used by Washington at Cambridge, January 1, 1776.

Guns, invented by Swartz, a German, about 1378; brought into use by the Venetians, 1382; great ones first used at the battle of Crecy.

1346; first used in England at the Siege of Berwick, 1405; first cast in England, 1554.

Handkerchiefs were first manufactured at Paisley, in Scotland, in 1743.

Homoeopathy was introduced into the United States in 1825.

Horseshoes.—Although the ancients protected the hoofs of their horses with some covering, horseshoes, of the kind now known, were not in general use until the ninth century.

Hydrometer.—The oldest mention of this instrument belongs to the fifth century, but its invention has been attributed to Archimedes.

Lace.—The knitting of lace is a German invention, first known about the middle of the sixteenth century.

Life-Boats, invented by Greathead, who received a premium from Parliament in May, 1802.

Lightning-Rods were first used by Benjamin Franklin about 1752.

Linen, first made in England by Flemish weavers, 1253; staining of linen first known in England, 1579; linen trade in Ireland, began by Lord Wentworth, 1634; British Linen Company erected, 1746.

Lithography, discovered, 1808; introduced into England, 1817; into the United States, 1828.

Magnifying-Glasses, first made in England by Roger Bacon, 1260.

Marble Paper.—A German invention belonging to the seventeenth century.

Microscopes, first used in Germany in 1621. Improved by Torricelli in 1624.

Organs, first introduced into churches by Pope Vitalian I., 683; into the western churches, 826.

Parchment, invented by King Attalus, of Pergamus, 887 B. C.

Paving with Stones, first introduced at Paris in 1186.

Post Office, first established between Vienna and Brussels in 1516. Posts established regularly between London and all the principal towns throughout England in 1635. Postage stamps were introduced in England in 1840; in the United States in 1847.

Ribbon Looms.—It has been asserted that these looms were first known to the Swiss, but others claim their invention for a German in the town of Dantzic in the sixteenth century.

Ruling Machines, invented by a Dutchman in London in 1792.

Sewing Machine, first patented in England, in 1755. The first complete machine was constructed by an American, Elias Howe, in 1846.

Sextant, invented by Tycho Brahe, at Augsburg, in 1550.

Silk, Raw, first made by people of China, called Sers, B. C. 150; first introduced from India, 374; a pound at this time was worth a pound of gold; manufacture of, introduced into Europe from India by some monks, 551; first worn in dress, 1455; first silk manufactured in France, 1521.

Sleeping Cars were first used in 1858. Pullman's patent dates from 1864.

Speaking Trumpets, invented by Kircher, a Jesuit, in 1652.

Stirrups, according to a statement made by the Emperor Mauritius, were first used in the sixth century. Hippocrates and Galen speak of a disease which, in their time, was occasioned by long and frequent riding, because the legs hung down without any support.

Sun-dials, invented 558 B. C. The first in Rome, 308 B. C., was that erected by Papirius Cursor, when time was divided into hours.

Tanning Leather, a new and more expeditious method than that previously in use was invented in 1795.

Tapestry, invented by Sir Francis Train, 1255; the first manufactured in England, 1620.

Tin Mines, first discovered in Germany, 1240; till then those in England were the only ones in Europe.

Ventilators, first introduced by the Rev. Dr. Hales in 1740.

Violins of the modern kind invented about 1477. Introduced into England by Charles II.

Wall Papers, first used in Spain and Holland in 1555. Flock or velvet wall papers were first used in 1620.

Watches, supposed to have been invented by Peter Hale at Nuremberg, 1490; though Robert, king of Scotland, had one about 1310; first used in the astronomical observations by Purbach, 1500; spring watches invented by Hooke, 1658. Repeaters invented, 1676.

Water Mills for grinding corn are said to have been invented by Belisarius when Rome was besieged by the Goths in 555. Pliny, however, mentions wheels turned by water.

Weathercocks.—The earliest mention of a weathercock is that made by Vitruvius, concerning that on the tower built at Athens by Andronicus Cyrrhestes.

Weights and Measures, invented by Phidon, Tyrant of Argos, B. C. 864; fixed in England, A. D. 1257; equalized, 1825; weights originally taken from grain of wheat, the lowest of which is called a grain.

Windows of some kind were glazed as early as the third century; the fashion was introduced into England about 680, but did not become general until 1180.

Wine, the art of making, brought from India by Bacchus; none produced in France in

the time of the Romans; sold by apothecaries as a cordial, 1800; licenses for vending it, established 1661.

Woolen Cloth.—Although the making of woolen cloth is one of the most ancient of arts, its manufacture was not known in France until 1646, when it was made at Sedan. It was first made in England in 1331, but was not dyed or dressed until 1667.

Indian Summer.—Scientists differ regarding the cause of this phenomenon, which is peculiar to North America and certain parts of Central Europe. A change in the condition of the upper strata of the atmosphere, confining the radiating heat-rays in the lower strata, is generally held to be the true explanation. A theory to account for the smoky appearance, which appears plausible, is that it is due to the decay or slow chemical combustion of leaves, grass, and other vegetable matter under the action of frost and sun. It was to forest and prairie fires kindled by the Indians that the early settlers attributed the smoky appearance of the season. Hence the name "Indian Summer."

Infusoria are minute animalcules, some large enough to be barely visible to the naked eye (1-100 inch), but most of them altogether microscopic and almost exceeding the power of the glass to detect. They belong to the lowest order of animal life, have neither vessels nor nerves, and are made up of a uniform tissue called by Huxley *protoplasm*. The body has some well-defined form, of which the varieties are very great in different species. Many in the higher orders are furnished with hairs, the motion of which carries them with great rapidity through the fluid in which they live, and by means of which, also, currents are created in the fluid to bring food to the mouth. Some infusoria have a few slender filaments instead of hairs, which they agitate with an undulatory movement. Others move by contractions and extensions of their bodies. Some have stiff, bristle-like organs, which they use as feet for crawling on the surfaces of other bodies, and some have hooks, by which they attach themselves to foreign bodies. The food of the infusoria consists of organic particles of various kinds, and the different species have been remarked to show a preference, like those of higher animals, for particular kinds of food. The numbers of the infusoria are prodigious. They are found in all parts of the world, both in fresh and salt water, and in stagnant pools; but they are most usually developed in infusions of decayed animal and vegetable substances.

Iron, Discovery of.—The actual discovery of iron was probably made so early in the history of the human race that it cannot now

be accurately placed. The Bible ascribes the discovery of working iron to Tubal-Cain. The Egyptians ascribe it to one of their early mythological kings, Hephæstus, who has been identified by students with the Hephæstus of Greek and the Vulcan of Roman mythology. The Egyptians and the Assyrians made iron at a very early period of their history. In ancient tombs and ruins but recently unearthed, many implements of iron are found, cooking utensils, and weapons of various kinds. The Chalybes, a Scythian tribe living south and east of the Black Sea, who attained great skill in iron working, are accredited by ancient writers with being the first to use coal in their furnaces, the inventors of steel or hardened iron, and the discoverers of magnetic iron. The books of Moses mention the use of iron some eleven centuries before the Christian era, and the Arundelian marbles fix a date for it before 1870 B. C.

Jacquard Loom.—The Jacquard apparatus, for the purpose of pattern weaving, was invented by M. Joseph Marie Jacquard, a native of Lyons, France, in 1801. Being necessitated to carry on the weaving business of his father, for which he had a distaste, he endeavored to improve the existing machinery, and the Jacquard loom was the result. He enabled, by his invention, an ordinary workman to produce, with comparative ease, the most beautiful patterns in a style which had only previously been accomplished by skilled labor. The reception of his great invention by the public, however, was most discouraging, for although rewarded with a small pension by Napoleon, the silk weavers offered such violent opposition to its introduction that on one occasion he narrowly escaped with his life. The machine was destroyed by the weavers on the public square of Lyons. The merit of the invention, however, was too great to admit of its being long suppressed, and when its value was once fairly recognized it effected a complete revolution in the art of weaving, especially in the finer kinds of figured silk fabrics.

Jelly Fishes consist of a jelly-like mass, containing a cavity which generally has a mouth from which extend tentacles, varying in length from thirty to one hundred feet. From the center, tubes pass to connect with other tubes around the circumference. Their food is smaller marine animals, which they catch with thread-like lassos attached to their tentacles. Agassiz divided jelly fishes, or *medusæ*, into three orders: *Beroid medusæ*, *medusæ* proper, and *hydroidæ*. Of the beroids the most curious are the *pleurobrachia*, found off the northeast coast of America. The *medusæ*

proper, known as the "sun fish, when large is one of the most beautiful of the jelly fishes. The Gulf of Mexico furnishes the finest hydroids.

Lace-Making.—The application of machinery to lace making has cheapened lace that would otherwise always have remained expensive, and has consequently deprived a large number of the inhabitants of towns in France and elsewhere of a lucrative source of income. The great centers of the manufacture of real lace, as hand-made lace is called to distinguish it from machine-made or imitation lace, are Belgium, France, and England. In the former country there are at least 900 lace schools, and over 150,000 women find employment in this trade. Brussels lace, which is of very fine thread and intricate design, has a world-wide reputation. Mechlin lace, a fine and transparent web, is made at Mechlin, Antwerp, Lierre, and Turnbrouet. Valenciennes is largely made in Flanders, but is extinct in its native city, from which it derived its name. The towns of Ypres, Bruges, Courtrai, Menin, Ghent, and Alost produced this lace in large quantities and fine quality. Before the introduction of machinery the number of lace-makers in France was estimated to be at least 250,000, but this number has been greatly reduced within the last few years. The celebrated Point d'Alençon lace, which is made entirely by hand with a small needle, in small pieces, which are afterward united by invisible seams, is made chiefly at Bayeux. Another favorite lace, the Chantilly, which was formerly made almost altogether at Chantilly, is now made at Bayeux and Caen. Lille lace, which though simple in design is fine and beautiful, is the production of the town of Lille. The lace of Bailleul is strong and cheap, and extensively used for trimming. In the district of Auvergne, of which the town of Le Puy is the center, over 100,000 women are employed in lace-making, and nearly every kind of lace is made. The industry is considered more extensive and more ancient in this district than in any other portion of France. In England the counties of Buckingham, Devon, and Bedford are the centers of lace-making. The most widely known of the English lace is Honiton, so called from the town of this name in Devonshire. The manufacture of hand-made laces was an important industry in Nottingham some years ago, but it has been almost entirely destroyed by the introduction of machinery. Lace is made to a limited extent in Limerick, Ireland; also in Scotland, and in fact in nearly every country in Europe. The imitation or machine-made lace is manufactured in Caen, France; in Nottingham, England; and also in the United States.

Lamps are mentioned in all the early ages; they were in use in Egypt, Greece, and Rome. The earthen lamp which Epictetus, the philosopher, had in his study, sold, after his death, for 8,000 drachmas. Lamps with horn sides are said to be the invention of Alfred. London streets were first lighted with oil lamps in 1681, and with gas lamps in 1814. A lamp constructed to produce neither smoke nor smell was patented, in 1784, by a Frenchman, and was brought into general use in England early in the present century. On the principle of Argand are founded the lamps invented by Carcel, about 1808, and since 1825 the moderator lamps of Levassieur, Hadrot, and Neuburger. The domestic lamp is now of elegant manufacture and many artistic designs.

Latitude.—First determined by Hipparchus, of Nice, about 170 B. C. It is the extent of the earth, or of the heavens, reckoned from the equator to either pole. Maupertuis, in 1737, measured a degree of latitude, and made it 69.493; Swanberg, in 1803, made it 69.292. At the equator, in 1744, four astronomers made it 68.732; and Lambton made it 68.743; Mudge, in England, made it 69.148; Cassini, in France, made it 69.12, and Biot, 68.769; while a recent measure, in Spain, makes it 68.63—less than at the equator, and contradicts all others, proving the earth to be a prolate spheroid, which was the opinion of Cassini, Bernoulli, Euler, and others, while it has more generally been regarded as an oblate spheroid.

Life Insurance, Origin of.—The rise of life insurance may be traced to several sources. The doctrine of probabilities developed by Pascal and Huyghens as to games of chance was applied to life contingencies by the great Dutch statesman Jan De Witt in 1671, but it was not till some time after that it was applied to life insurance. In 1696 there was a hint at modern life insurance in a London organization, and this was followed by another association two years after. The operators of these two seem to have passed away without giving to their successors any clear account of their plan of operations. In 1706 the Amicable Society for a Perpetual Assurance Office was founded in London, and this is considered the first actual life insurance company established. Its plan was mutual—that is, each member, without reference to age, paid a fixed admission fee and a fixed annual payment per share on from one to three shares; at the end of the year a portion of the fund was divided among the heirs of deceased members in proportion to the shares held by each. In after years the limitations as to age, occupation, and health were added.

Liquid Air.—The liquefaction of gases is by no means new. It was accomplished in 1823 by Faraday, who succeeded in obtaining liquid chlorine by applying pressure to the gas and lowering its temperature. Two factors are necessary to liquefy a gas, pressure and cold. Every gas, so far as now known, will liquefy under a given pressure, provided it is cooled to a certain temperature known as its "critical temperature." In 1877, two French experimenters, Pictet and Cailletet, working separately, and along different lines, succeeded in liquefying oxygen. This was followed in 1883 by successful experiments by two Russian physicists, Wroblewski and Olszewski. Among other surprising results they succeeded in freezing alcohol. It was not until 1895 that liquid air and oxygen were produced in any quantity. This was first done by Prof. Dewar, of the Royal Institution, London. The process claimed by Mr. Tripler of New York is also claimed by Mr. Thompson in England, and Dr. Carl Linde of Munich, Germany.

The effects of the intense cold of liquid air are remarkable. Many soft and elastic materials when immersed in it become brittle. An instance of this is rubber. One of the most promising practical applications of liquid air has been the manufacture of oxygen. The liquid boils at about 310° F. and, as the nitrogen boils away most rapidly, a large proportion of oxygen remains. This liquid oxygen, if mixed with a good combustible, such as cotton, makes a high-power explosive, though it has not as yet been widely successful. For refrigerating purposes and as a motor power, largely because of its expensiveness and the impossibility of controlling it, liquid air has not fulfilled expectations. In medicine, and for ventilating and cooling rooms, it is valuable.

By distillation of liquid air, Ramsey and Dewar showed the presence in the atmosphere of the gaseous elements, helium, neon, argon, krypton and xenon.

Magnet.—The iron ore which possesses the property of attraction was given the name of magnet by the Greeks, because it was first found in Magnesia, in Asia Minor, or according to another account because it was first discovered by a shepherd named Magnes, who had iron tips on his shoes, and while walking over some rocks found that his feet stuck to them in a mysterious way. The ore is now called magnetite, and is an oxide of iron containing about seventy-three per cent. of iron when pure. It is a very valuable ore, and supplies a large amount of the finest iron and steel of commerce. Large deposits occur in Norway and Sweden, Finland and the Ural; in the Adirondack region in northern New

York; in northern New Jersey; in eastern Pennsylvania, the most noted locality being Cornwall, Lebanon County, where the mines have been worked for over a hundred years; in North Carolina, California, and Oregon, and several places in Canada. It is also found in the form of sand in some places in North America, India, and New Zealand. One of the largest occurrences of magnetic sand is on the south shore of Long Island, near Quogue, where a furnace was built and an attempt made to work it; but the enterprise proved unsuccessful and was abandoned.

Mariner's Compass.—The Chinese ascribed the invention of the compass to their Emperor Hong-Ti, who they say was a grandson of Noah; some of their historians refer the invention of it to a later date, 1115 B. C. The honor of its discovery, however, though much disputed, is generally given to Flavio Gioja, a native of Amalfi, an ancient commercial city of Naples, A. D. 1302. The compass is also said to have been known to the Swedes in the time of King Jarl Birger, 1250. The variation of the needle was first discovered by Columbus in his voyage of discovery, 1492. The compass box and hanging compass, used by navigators, were invented by William Barlowe, an English divine and natural philosopher, in 1608. The measuring compass was invented by Jost Bing, of Hesse, in 1602. The dipping needle was invented by Robert Norman, a compass maker of Ratcliffe, England, in 1580.

Matches, Invention of.—Previous to 1805, the matches in use consisted of a slender stick with a pointed end, which had been dipped in sulphur; they were lighted by touching them to a spark struck into tinder by flint and steel. In that year the "Instantaneous Light-Box" was invented. It consisted of a small tin box containing a bottle, in which was placed some sulphuric acid, with sufficient fibrous asbestos to soak it up and prevent its spilling out of the bottle, and a supply of properly prepared matches. These consisted of small splints of wood about two inches long, one end of which was coated with a chemical mixture prepared by mixing chlorate of potash, powdered loaf-sugar and powdered gum arabic, the whole colored with a little vermilion, and made into a thin paste with water. The splints were readily inflamed by dipping the prepared ends into the sulphuric acid. These were succeeded by the lucifer, or loco-foco match, which was ignited by friction; that, in turn, by the Congreve, which was similar to the sulphur matches now in use; and this, shortly afterward, by the present parlor match.

Maxim Self-Acting Gun was invented

by Hiram S. Maxim of England. The peculiar features of this gun are: Every round after the first is fired by the recoil of the previous explosion; the cartridges are picked out of the cartridge belt, one end of which is placed in the gun mechanism on one side by the automatic action of the gun, and the belt and cartridge shells are ejected after firing; every recoil of the gun brings the next cartridge into position, forces it into the barrel, cocks the hammer, pulls the trigger, extracts the empty shell, and ejects it from the gun—all these processes going on with such marvelous rapidity that six hundred rounds are fired in a minute. The gun can be turned in any direction by means of a crank, and the rate of discharge is regulated by a controlling chamber, ingeniously contrived so that the gun may be fired rapidly or slowly, as desired. At the moment of firing, the recoil drives the barrel back about three quarters of an inch, and it is this recoil which directs the mechanism of the gun and makes its discharges continuous.

Medicine appears to have been first practiced by the Egyptian priests. Pythagoras endeavored to explain the philosophy of disease and the action of medicine about 529 B. C. Hippocrates, the Father of Medicine, flourished about 422 B. C., and Galen, born A. D. 131, was the oracle of medical science. About 980, Avicenna, an Arab, wrote a system of medicine. The art was brought into Europe from the East, about A. D. 1150. In the early stages of the practice, the preparation of simples was principally confined to ecclesiastics in Europe generally, until the close of the fifteenth century. The dogmatic age of medicine lasted until the Reformation, when it was attacked by Paracelsus (1493-1541) and Vasa-lius (1514-64). Since 1800 medical practice has been completely transformed by physiological and chemical research. The practice of medicine is now one of the highest sciences, and in most countries is in the hands of learned and distinguished men; various statutes have been enacted to discourage pretenders to the healing art.

Meerschaum is a mineral existing in many parts of the world. In Europe, it is found chiefly at Hrubschitz in Moravia, and at Sebastopol and Kaffa in the Crimea; and in Asia it is found abundantly just below the soil in the alluvial beds at Kittisch and Bursa in Natolia; and in the rocks of Eske-Hissar, in the same district, it is mined so extensively as to give employment to nearly a thousand men. Meerschaum, from its having been found on the seashore in some places, in peculiarly rounded snow white lumps, was ignorantly imagined to be petrified froth of the sea,

which is the meaning of its German name. It is composed of silica, magnesia, and water. When first dug from the earth it is quite soft and soap-like to the touch, and as it lathers with water and removes grease, it is employed by the Turks as a substitute for soap in washing. After being molded into pipes, these are boiled in oil or wax and baked until hard.

Mesmerism was first brought into notice by Frederick Anton Mesmer, a German physician, in 1766, when he published a thesis on "The Influence of the Planets on the Human Body," claiming that the heavenly bodies diffused through the universe a subtle fluid which acts on the nervous system of animated beings; and he further stated that he regarded the new force, which, he said, could be exerted by one living organism upon another, as a means of alleviating or curing disease. In 1778 he left Vienna for Paris, where he gained numerous proselytes and much money. His discovery was fostered by Dr. D'Elson, physician to the king's brother, and in 1784 the French government ordered the medical faculty of Paris to investigate Mesmer's theory. A committee was appointed, who subsequently reported that "The violent effects which are observed in the public practice of magnetism are due to the manipulations, to the excitement of the imagination which leads us to repeat anything which produces an impression upon the senses." One year later, 1785, Mesmer's popularity had so far declined that he left Paris and retired to Switzerland, where he spent the balance of his life. Mesmerism excited some attention again in 1848, when Miss Harriet Martineau and others announced their belief in it.

Meteors.—Meteors are small, erratic bodies rushing through the planetary system, and, getting hot in the process, appear in the atmosphere surrounding our earth as "shooting stars." Some of these falling bodies have reached the earth, and such are called "aërolites" or "meteorites." Numbers, of course, are burned up before they reach us, and who can tell what destruction such a catastrophe may represent, or whether it be or be not an inhabited world which has thus been plunged to destruction by fire? They are of a metallic or stony nature. On certain nights in August and November it has been calculated that these meteors will appear. They fall from certain constellations, after which they are named; as Leonides, from Leo, in the November displays.

The star showers sometimes present the appearance of a beautiful display of rockets. Millions of them rush round the sun, and when, as occasionally happens, our earth

comes near them, we have a grand display of celestial fireworks.

It is estimated that the average number of meteors that traverse the atmosphere daily, and which are large enough to be visible to the eye on a dark, clear night, is 7,500,000; and if to these the telescopic meteors be added, the number will be increased to 400,000,000. In the space traversed by the earth there are, on the average, in each volume the size of our globe (including its atmosphere), as many as 13,000 small bodies, each one capable of furnishing a shooting star visible under favorable circumstances to the naked eye.

Metric System. The, originated in France about 1790. In 1799, on the invitation of the Government, an international convention, at which were present representatives from France, Holland, Denmark, Sweden, Switzerland, Spain, Savoy, and the Roman Republics,

assembled at Paris to settle, from the results of the great Meridian Survey, the exact length of the "definitive meter." As a result of the investigations of this learned body, the Metric System was based upon the length of the fourth part of a terrestrial meridian. The ten-millionth part of this arc was chosen as the unit of measures of length, and called Meter. The cube of the tenth part of the meter was adopted as the unit of capacity, and denominated Liter. The weight of a liter of distilled water at its greatest density was called Kilogramme, of which the thousandth part, or Gramme, was adopted as the unit of weight. The multiples of these, proceeding in decimal progression, are distinguished by the employment of the prefixes *deca*, *hecto*, *kilo*, and *myria* (ten, hundred, thousand, ten thousand) from the Greek, and the subdivisions by *deci*, *centi*, and *milli* (tenth, hundredth, thousandth) from the Latin.

Measures of Length (Unit, Meter).

Microphone. The, is the black carbon button used in telephones, and is an instrument for magnifying sound. The most sensitive substance, so far as yet discovered, to have the peculiar power, when placed in the electric current, of magnifying sound, is willow charcoal plunged, when at white heat, into mercury. A piece of such charcoal an inch long, placed vertically between two blocks of carbon, hollowed to receive its ends, wires connecting the blocks with an electric battery, and the ordinary receiving instrument of a telephone, con-

stitute one of the simplest forms of a microphone. The invention of the microphone is claimed by Professor Hughes of England, and Thomas Edison, the American inventor.

Microscope. Invention of the.—It is generally believed that the first compound microscope was made in 1590 by a Hollander named Zacharias Jansen. Pocket microscopes were first made in London in 1740 by Benjamin Martin. The discovery of the magnifying power of the simple lens was undoubtedly made long before the Christian era, as it is

known that the Greeks used magnifiers of glass which they called "reading-glasses," and rude lenses of crystal have been found in Egyptian ruins.

Mirage.—Mirage (sometimes called *Fata Morgana*) is the appearance in the air of the image of some distant object, seen either in connection with the object itself, above or below the latter, or suspended in the air, the object being invisible. It is a very curious but sufficiently common phenomena, and in the Asiatic and African plains it is frequently observed. When the weather is calm and the ground hot, the Egyptian landscape appears like a lake, and the houses look like islands in the midst of a widely-spreading expanse of water. This causes the mirage, which is the result of evaporation, while the different temperatures of the air strata cause an unequal reflection and refraction of light, which give rise to the mirage. Travelers are frequently deceived, but the camels will not quicken their usual pace until they scent water.

The *Fata Morgana* and the inverted images of ships seen at sea are not uncommon on European coasts. Between Sicily and Italy this phenomenon is seen in the Sea of Reggio with fine effect. Palaces, towers, fertile plains, with cattle grazing on them, are seen, with many other terrestrial objects, upon the sea—the palaces of the Fairy Morgana. The inverted images of ships are frequently perceived, and many most extraordinary but perfectly authentic tales have been related concerning the reflection and refraction of persons and objects in the sky and on land, when no human beings nor any of the actual objects were within the range of vision.

Mirrors.—In ancient times mirrors were made of metal; those of the Jewish women of brass; mirrors of silver were introduced by Praxiteles, 328 B. C. Mirrors or looking-glasses were made at Venice, A. D. 1300; and in England, at Lambeth, near London, in 1673. The French excelled in their manufacture of them in the last century. Various methods of coating glass by a solution of silver, thus avoiding the use of mercury, so injurious to the health of the workman, have been made known, by M. Petitjean, in 1851; by M. Cimeg, in 1861, and by Liebig and others.

Mother-of-Pearl.—The shells of many molluscous animals display a brilliant pearly and iridescent luster, resulting from the peculiar manner in which the layers of calcareous matter of which they are composed have been successively formed. Such shells, even when small in size, form bright and, especially to the untutored eye, attractive ornaments, and as such are used for necklaces and similar

purposes. When the shells are of sufficient size to cut and shape for purposes of utility, they become articles of some commercial importance under the name of Mother-of-Pearl. This term, though applicable to all pearly shells, is in commerce principally applied to the shells of the bi-valve pearl mussel, which is the principal source of the commercial product.

The largest and steadiest consumption of mother-of-pearl is in the button trade, and much is also consumed by cutlers for handles of fruit and dessert knives and forks, pocket-knives, and other forms of cutlery. It is also used in the inlaying of Japanese and Chinese lacquers, European lacquered papier-maché work, trays, toys, and as an ornamental inlay generally. In an innumerable variety of small and fancy articles, mother-of-pearl is also employed, its use being limited only by the moderate dimensions and thickness of material obtained, and its rather brittle nature.

The carving of pilgrim shells, and the elaboration of crucifixes and ornamental work in mother-of-pearl is a distinctive industry of the monks and other inhabitants of Bethlehem. Among the South Sea Islands the shell is largely fashioned into fishing hooks, a purpose for which its brilliant, conspicuous appearance seems to render it suitable without the addition of any bait or other lure.

Music.—Lucretius ascribes its invention to the whistling of the winds in hollow reeds. Franckinus, to the various sounds produced by the hammers of Tubal-Cain; Pontique and others to the singing of birds; and Zarlino to the sound of water. It is however agreed that music was first reduced to rules by Jubal, 1800 B. C. The flute and harmony or concord in music was invented by Hyagnis, 1506. Vocal choruses of men are first mentioned 56 B. C. The first six musical notes are said to have been invented by Guy Aretino, a Benedictine monk of Arezzo, about 1025. The notes of present use were perfected in 1338. Musical pitch was settled in France in 1859. Pythagoras maintained that the motion of the twelve spheres must produce delightful sounds inaudible to mortal ears, which he called the music of the spheres. Saint Cecilia, a Roman lady, is said to have excelled so eminently in music, that an angel was enticed from the celestial regions by the fascinating charms of her melody; this hyperbolic tradition has been deemed sufficient authority to make her the patroness of music. She died in the third century.

Nails.—It is only since 1810 that machinery has been employed to any extent in the manufacture of nails. Previous to that date,

they were made by hand by forging on an anvil, and great numbers of men were employed in the industry, there having been as many as 60,000 nailers in the neighborhood of Birmingham alone. It appears that as early as 1606 a patent was obtained for cutting nail rods by water power, by Sir Davis Bulmer. An improvement on this was patented in 1618, and a new invention in 1790, which last was the first nail machine in actual use; it was patented by Thomas Clifford, and used in French's factory at Wimburn, Staffordshire, in 1792. Toward the close of the last century many patents were obtained in the United States for new machines and improvements on old ones. Many of the first inventors spent large sums of money on their machines, and it has been estimated that it cost fully \$1,000,000 to bring them to the perfection attained in 1810, when a machine made 100 nails a minute. The machine invented by Jesse Reed of Massachusetts, about 1800, is the one which first came into general use, and this, with some improvements, is the one most largely used to-day. In 1810, Joseph C. Dyer of Boston, then a merchant in London, took out patents in England for the nail machinery invented in Massachusetts. It was at once widely introduced, and large manufacturing establishments were soon founded. Some factories at Birmingham are now capable of making over 40,000,000 nails a week. The term penny, used to indicate the size of nails, is supposed to be a corruption of pound; thus a fourpenny nail was one such that 1,000 of them weighed four pounds; a tenpenny, such that 1,000 weighed ten pounds. Originally, the "hundred," when applied to nails, meant sixscore, or 120; consequently the thousand was 1,200. In France, the greater part of the nails used in carpentry-work are made of soft iron wire, pointed with the hammer, and the head is formed by pinching them in a toothed vise.

Nebular Hypothesis.—The Nebular Hypothesis assumes that the solar system was once an enormous mass of gaseous substance. Rapid rotation arising in this gaseous mass, it took the form of a disc, and at last inertia (popularly but erroneously called centrifugal force), overcoming cohesion, whole rings and fragments flew off from this disc, and by gravitation contracted into spheroid masses. As, in the original mass, the velocity of the outer circle of each body thrown off is greater than the inner circle, this causes each spheroid to revolve on its own axis. This process goes on, and the central mass continues to cool and shrink until we have at last a central body with a number of smaller spheroidal bodies re-

volving around it in orbits; the smaller, the nearer they are to the central orb. Certain points are assumed in this hypothesis to explain the distribution of matter in our solar system. It is assumed that in throwing off great masses from the central disc, immense quantities of minute particles were also thrown, which continue to revolve, in the same plane with the large mass around the central body. By slow degrees these minute atoms, by the law of gravitation, were aggregated into the mass nearest to them. These subordinate aggregations would form with most difficulty nearest the large central mass, because of the superior attractive force of the latter, wherefore the interior planets—Mercury, Venus, the Earth, and Mars—are smaller than the two great orbs in the zone beyond them. These two enormous planets, Jupiter and Saturn, occupy the space where conditions are most favorable to subordinate aggregations; but beyond them the gravity of aggregating material becomes reduced, and so the planets found in the outer zone, Uranus and Neptune, are smaller than the planets of the middle zone. This hypothesis was first suggested by Sir William Herschel, and was adopted and developed by Laplace.

Needles.—The making of Spanish needles was first taught in England by Elias Crowse, a German, about the eighth year of Queen Elizabeth, and in Queen Mary's time there was a negro who made fine Spanish needles in Cheapside, London. At his death the secret of fabrication was lost, and not recovered again till 1566. The family of Greenings, ancestors of Lord Dorchester, established a needle factory in Bucks a little later. German and Hungarian steel is of best repute for needles. The manufacture was greatly improved at White Chapel, London; Redditch, in Gloucestershire; and Hathersage, in Derbyshire. An exhibition of ancient needles and needlework was formed at South Kensington museum in 1873.

Nickel was first obtained as a metal in Germany about 1751; but the ore had been previously known to miners, who called it *kupfernickel*, or Old Nick's copper, for the reason that, though it looked like copper ore, no copper could be obtained from it. Nickel, when pure, is silvery white, and does not oxidize or tarnish in the air. It is found in many parts of the world, but the principal mines are in Russia, Sweden, Germany, Austria, England, and Scotland, and in the states of Pennsylvania and Connecticut in America. Its chief use is for plating other metals, but it is also used in alloys.

Oceans, Depths of.—The average depth of all the oceans is from 2,000 to 3,000

fathoms. Soundings have been made in the Atlantic Ocean, ninety miles off the island of St. Thomas, in the West Indies, which showed a depth of 23,250 feet, or about four and one-half miles. In 1872-'74, the ship *Challenger* made a voyage around the world for the purpose of taking deep-sea soundings, and the result showed that the greatest depth in the Pacific Ocean was between four and one-half and five miles, while that of the Atlantic was probably as given above.

Ocean Steam Navigation.—The first ocean steam navigation in the world was by the steamboat *Phoenix*, built by Colonel John Stevens, and navigated from Hoboken, N. J., to Philadelphia in 1808 by Robert L. Stevens. In 1819, the *Savannah*, an American vessel of 380 tons burden, built at Corlear's Hook, N. Y., made the first steam voyage across the Atlantic. The steamer went from New York to Savannah, Ga., and thence to England. From England she proceeded to St. Petersburg, Russia, where an effort was made to dispose of her to the czar. The sale not being consummated, she returned to New York, and was afterwards converted into a sailing vessel.

Ohm's Law is so named from its discoverer, Georg Simon Ohm, a German physicist, born 1787, died 1854. He devoted himself particularly to the investigation of the laws governing galvanic currents, and by a combination of mathematical and experimental investigation, carried on for many years, he at length discovered and established the law which forms the basis of the mathematical theory of electricity. His discoveries were first announced in scientific journals in 1825-'26. This fundamental theorem, known as Ohm's Law, may be briefly stated as follows: The strength of a galvanic current is equal to the electro-motive force divided by the resistance. The term ohm is now used to designate the standard measure or unit of galvanic resistance, and is equal to the resistance of a cylindrical wire of pure copper one twentieth of an inch in diameter and 250 feet long.

Oleomargarine.—The belief which is prevalent among the masses that the ingredients which constitute oleomargarine are unclean is fallacious, as will be seen by the following description: Clean beef fat and a proportionate quantity of salt are by process of machinery and heat transformed into what is called white stearine and butter oil, otherwise the oil which has been pressed from the fat. This oil is then churned in the proportion of about 442 pounds of butter oil, 120 pounds of milk, 37½ pounds of cream-made butter, and 1½ ounces of bicarbonate of soda. To this some coloring matter is added, and the mixture

churned for some fifty minutes, giving as a result a smooth mass resembling an emulsion of cream. This is put into ice-cream freezers and kept constantly agitated until it solidifies. It is then worked over with revolving butter-workers to get the necessary amount of salt well into it, and is then packed in firkins or made into molds. Science shows that chemically, pure oleomargarine butter differs but slightly from pure cream butter. By analysis the constituents of cream butter are: Water 11.968, butter solids 88.032. Those of oleomargarine are: Water 11.203, butter solids 88.797. The process of making oleomargarine was invented by M. Hippolyte Niegé, a French chemist, about 1872; but later experiments, made by Doctor Mott of New York, added to the commercial value of the original process. The name is derived from two words—oleine and margarine. Oleine is the thin, oily part of fats, and margarine is a peculiar, pearl-like substance, extracted from some vegetable oils, and also from some animal fats, the name being of Latin origin, from *margarita*, a pearl.

Painting.—An art, according to Plato, of the highest antiquity in Egypt. Osymandyas caused his exploits to be represented in painting, 2100 B. C. Pausias, of Sicyon, was the inventor of the encaustic, a method of burning the colors into wood or ivory, 335 B. C. The ancients considered Sicyon the nursery of painters. Antiphiles, an Egyptian, is said to have been the inventor of the grotesque, 332 B. C. The art was introduced at Rome from Etruria, by Quintus Fabius, who on that account was styled *Pictor*. The first excellent pictures were brought from Corinth by Mummius, 146 B. C. After the death of Augustus not a single painter of eminence appeared for several ages; Ludius, who was very celebrated, is supposed to have been the last, about A. D. 14. Painting on canvas seems to have been known at Rome in A. D. 66. Bede, the Saxon historian, who died in 735, knew something of the art. It revived about the end of the thirteenth century and to Giovanni Cimabue of Florence is awarded the honor of its restoration. It was at once encouraged and generously patronized in Italy. John Van Eyck, of Bruges, and his brother Hubert, are regarded as the founders of the Flemish school of painting in oil, 1415. Paulo Uccello was the first to study perspective. The earliest mention of the art in England is A. D. 1523, about which time Henry the Eighth patronized Hulbein, and invited Titian to his court. Wilkins invented a process of using oil with mineral colors for frescoes in 1853. The first practicing artist of celebrity in the United

States was John Watson, who commenced painting portraits in New Jersey, 1715. Benjamin West was the first native American artist; born in Chester County, Pennsylvania, 1708. John Singleton Copley, born in Boston, 1788, began his first important work in 1760. Other noted American painters, belonging to the early period, were Charles W. Peale, Gilbert Charles Stuart, John Trumbull, William Dunlap, and E. G. Malbone. Latterly American artists have been greatly influenced by the French schools.

Paper Hangings.—The invention of hangings of paper to take the place of other more costly hangings, has been attributed to a manufacturer of paper hangings named Breitkopf, of Leipsic. That kind known as velvet paper is said to have been invented by Jerome Lanyer, an Englishman, who received a patent for it in 1684, although the invention has also been claimed for François, a Frenchman, who is asserted to have introduced it at Rouen, in 1620.

Paper, History of.—It is generally conceded that the Egyptians were the first manufacturers of paper, which they made from papyrus, a species of reed. In former times this plant grew in abundance on the banks of the Nile, but it is now said to have disappeared from Egypt. It was called by the Egyptians "papu"; by the Greeks "papyrus"; our word paper is a later derivative. Herodotus named it "byblus," whence came the Greek "biblion" (book) and our word Bible. The ancient Mexicans used a kind of paper prepared from the maguey plant that grows on tablelands and closely resembles the Egyptian papyrus. This paper took ink and color well, as is attested by specimens which have been preserved. The credit of being first to form from fiber the web which constitutes modern paper belongs to the Chinese, and the art was known to them as early as the commencement of the Christian era. In the seventh century the Arabians learned the art of making it from cotton from the Chinese, and the first manufactory was established at Samarcand, about A. D. 706. From thence it was taken into Spain, where under the Moors paper was made, it is thought, of hemp and flax as well as cotton. Just when linen rags were first used in the composition of paper is uncertain; but the best evidence is offered by the Arabian physician Abdollatiph, who writes, in an account of his visit to Egypt in the year 1200, "that the cloth found in the catacombs and used to envelop mummies was made into garments or sold to the scribes to make paper for shopkeepers"; and as there is no doubt that these mummy cloths were linen, it proves

the use of this material to be of considerable antiquity. Of the use of linen rags in Europe, the earliest proof is the celebrated document found by Ichwandner in the monastery of Goss, in Upper Styria, which purports to be a mandate of Frederick II., Emperor of the Romans, and is dated 1242. It is written on paper which has been proved to have been made of linen. The practice of making a distinctive watermark on paper was also of very early date, as manuscripts as old as the thirteenth century bear it. There is, however, no really satisfactory information respecting the exact time or place of the introduction of paper making into Europe. By some it is supposed that Spain was the first to receive the art, and that thence it spread to France and Holland, and subsequently to England; but it is quite certain that England was a long time behind the other countries. As proof of this we find that the first patent for paper making was taken out in 1665, by one Charles Hildeyerd, but it was for "the way and art of making blew paper used by sugar-bakers and others." Ten years later, 1675, a patent was taken out by Eustace Barneby for "the art and skill of making all sorts of white paper for the use of writing and printing, being a new manufacture, and never practiced in any way in any of our kingdomes or dominions." Paper is now made out of cotton and linen rags, waste paper, straw, esparto grass, wood, cane, jute, and manilla.

Papier-Mache has been in use for more than a century in Europe, and it is thought probable that it was first suggested by some of the beautiful productions of Sinde and other parts of India, where it is employed in making boxes, trays, etc., as well as in China. Its first application, as far as is known, was to the manufacture of snuff boxes by a German named Martin in 1740, who learned it of a Frenchman named Lefevre. The cheaper articles of papier-maché are made of paper reduced to a pulp with water and glue, and pressed in oiled molds. Better articles are produced by pasting together sheets of paper, and when a proper degree of thickness is attained it is pressed into the shape desired. When moist, this substance may be made to take any form, and when dry may be planed into any shape. A brilliant surface can be had by polishing with rotten stone and oil. Papier-maché is much used to make architectural ornaments, both for exterior and interior decorations. The sheets of paper, placed in layers with glue, are pressed into metal molds for some hours; then they are removed, and a composition of paper pulp, mixed quite thin with resin and glue, is poured in, and the paper impressions are again put in and subjected to powerful

pressure. This causes the composition to adhere to the molded articles, and gives them the rough surface that is desired. Papier-maché can be made waterproof by adding to the pulp sulphate of iron or some of the silicates, and fireproof by mixing with clay and borax, phosphate of soda, or any alkali.

Parchment.—The ordinary writing-parchment is made from the skins of the sheep and she-goat; the finer kind, known as *vellum*, is made from those of very young calves, kids, and lambs. The thick, common kinds of parchment, which are used for drums, tambourines, battledoors, etc., are made from the skins of old he-goats and she-goats and in northern Europe from wolves; and a peculiar kind which is used for tablets, is made from asses' skins. Parchment, as a writing material, was known at least as early as 500 B. C. Herodotus speaks of books written upon skins in his time. Pliny, without good grounds, places the invention as late as 196 B. C., stating that it was made at Pergamos (hence the name *Pergamena*, corrupted into English parchment). Possibly the Pergamian invention was an improvement in the preparation of skins, which had certainly been used centuries before. The manufacture rose to great importance in Rome about a century before Christ, and soon became the chief writing material; and its use spread all over Europe, and retained its pre-eminence until the invention of paper from rags.

Pearl Fisheries.—The cause of the pearl is the introduction of a grain of sand or other foreign substance into the shell of the pearl oyster. This causes an irritation of the delicate tissues of the oyster, which immediately deposits the pearly matter around it for protection. Advantage of this fact has been taken to put substances within the shells of young oysters to induce the formation of pearls, and the Chinese by this method force a species of fresh-water mussels to produce the jewel. The most important pearl fisheries of the world are those of Ceylon and Coromandel, in the Indian Sea, whence pearls have been obtained since the earliest times of history. The divers are natives, trained to the pursuit, who are accustomed to descend to the depth of six or eight fathoms some forty times a day, and remain under water from a minute to a minute and a half. The fishing season begins in March or April and lasts but one month. A single shell may contain from eight to twenty pearls, varying in size from that of a small pea to about three times that size. The coasts of Java, Sumatra, Japan, and also Colombia and other points on the shores of South America have yielded large quantities of pearls; but they are usually smaller than the Oriental pearls.

Percussion Caps, Composition of.—The explosive which is used in the making of percussion caps is a fulminate of mercury, made by first dissolving 100 parts mercury in 1,000 parts of nitric acid—or 740 parts by measure. When the solution is heated to 130 degrees Fahrenheit it should be slowly poured through a glass funnel tube into 830 parts alcohol, sp. gr. .830—or 1,000 parts by measure. After effervescence, filtering, washing, and drying, the explosive is dropped into the copper cap.

Perfumery.—Directions are given for making the holy incense in Exodus, chapter 30, 1490 B. C. The Scriptures abound with instances of the use of incense and perfumes. Philip Augustus of France granted a charter to the master perfumers in 1190. Perfumes became fashionable in England in the reign of Elizabeth. No such trade as a perfumer was known in Scotland in 1763. A stamp tax was laid on various articles of perfumery in England, and the vender was obliged to take out a license, in 1786. In 1860 there were about forty manufacturing perfumers in London; in Paris about eighty.

Petrified Bodies.—Petrification is simply the substitution of the organic substance by the inorganic, atom by atom. As a molecule of wood or bone decays, a molecule of stone takes its place. This can only occur when the air, or earth, or water surrounding the organic substance holds in solution some readily precipitated mineral. In the case of a woody substance, or of bone, while decomposition goes on there yet remains a framework whose interstices are gradually filled by the mineral substance; but in the case of flesh no such framework exists. The very rapid decay of flesh also makes it impossible for the very slow process of petrification to have any effect upon it. The stories of petrified bodies found in graveyards, that float periodically through the press, are usually made up of "whole cloth," as the saying is, though it is true that bodies of both men and animals have been found incrustated with silicious substance so as to resemble petrifications. These, however, when veritable finds, are fleshless skeletons, the soft parts of the body having decayed while the slow process of incrustation was going on. It may be noted here that but one true human bone petrification has ever been found, and that is the "Fossil Man of Mentone," discovered in 1873-74. The majority of fossils, be it remembered, are of great age, antedating the existence of man on the earth. In places where the silicious deposits have been rapid, as in limestone caverns, human bones, fossilized, have been discovered. Two

human skeletons were found in an apparent state of complete petrification on the Island of Guadalupe early in the present century. One of these was placed in the British Museum, and the other in the museum at Paris. But examination showed that in these the bony structure still remained, though it was completely incased in the calcareous deposits. In excavating in the cavern of Mentone, in France, on the coast of the Mediterranean, some fifteen years ago, M. Rivière, a noted French scientist, found a number of human bones and a complete skeleton in a true fossil condition, which were complete evidence of the existence of men upon the earth at a period of very great antiquity.

Phonograph.—The phonograph is a machine for recording and then transmitting sounds, speech, music, etc. It is the invention of Thomas A. Edison, the most noted electrician of this age. The phonograph was accidentally discovered. Mr. Edison was at work on an apparatus for recording a telegraphic message, by having an armature (with a needle fastened in one end) of the sounder make indentations on a piece of tin foil wrapped around a cylinder. The message would thus be punctured or indented on this tin foil, then, by substituting another needle—blunt—for the sharp one and turning the cylinder, the armature would be vibrated as the needle entered into and passed out of the indentations. While experimenting, he turned the cylinder very rapidly, and instead of a succession of “clicks,” a musical sound was produced. He seized the idea, and the Edison phonograph is the result.

The perfected phonograph of to-day consists of a cylinder of wax, or other plastic material, which is revolved either by hand, foot power, or an electric motor. This cylinder, called the phonogram, is used for recording the sound. This is done by a diaphragm—such as is used in a telephone—into the center of which is fastened a sharp needle, which rests upon and just touches the phonogram. When the words are spoken the diaphragm vibrates, moving this needle up and down, and a series of indentations are made in a spiral line on the phonogram, which is turning around about eighty-five times a minute. To make the phonograph speak, or repeat the words, another diaphragm, similar to the first or recorder, but having a blunt instead of a sharp needle, is placed at the starting point and the phonogram made to revolve; of course, as the needle passes over the indentations it vibrates the diaphragm and the words are reproduced, as in a telephone.

The phonograph faithfully reproduces mu-

sic, whistling, singing, speech, or any sounds, and the phonograms can be packed into a mailing tube and sent all over the world to be used as often as desired.

Phosphorescence is the property which some bodies possess of being luminous in the dark without the emission of sensible heat. There are five kinds distinguished by physicists, and designated as follows: Spontaneous phosphorescence; phosphorescence from the effects of heat; from mechanical action; from the action of electricity; by insolation or exposure to the light of the sun. The first is by far the most common and familiar phenomenon, being exhibited by certain living organisms both in the vegetable and animal kingdoms. There are flowers of a bright red or yellow color which have been observed to emit light flashes in the dark, and other plants which give out a faint, continuous light, caused probably by the oxidation of some hydro-carbon which they secrete. The best known examples, however, are those seen in animals, as the glow-worm or firefly, and the myriads of minute animalcula which cause the magnificent displays of phosphorescence that are often seen at sea by night, especially in the tropics, and in temperate zones during the summer. Various causes have been assigned for this animal phosphorescence, and they doubtless vary with different animals. In the glow-worm and firefly it is thought to be produced by an act of the will. M. Jousset discovered the liquid which exudes from the crushed eggs of the glow-worm to be phosphorescent, and to remain so until dried up. In the marine animalcula, it is believed that a subtle luminous matter is thrown off as a secretion supplied by glands having this special function; and some naturalists assert that it contains epithelial cells in a state of fatty degeneration, the decomposing fat being the cause of the phosphorescence. That phosphorescence seen in decaying fish and other animal matter, and in wood (called “fox-fire”), is due to a species of slow combustion by which vibrations are excited capable of emitting luminous rays. The other kinds of phosphorescence are, for the most part, seen only in scientific experiments, except the last, which is now receiving some application in articles of everyday use, as match boxes, clock-faces, etc.; they are covered with a preparation possessing this property, and remain luminous, and therefore easily visible in the dark. Certain compounds have been discovered which exhibit the property in a high degree, as Canton’s phosphorus, Bolognese phosphorus, etc. It is probably due to the absorption of the energy of the vibrations falling upon them, which is afterward

radiated from them again. It is probable that all bodies possess the quality in a greater or less degree; but with the great majority the duration of the phenomenon is very short—rarely more than a small fraction of a second. The phenomenon has no connection with ordinary phosphorus, but the name is thence derived from the similar light emitted by phosphorus in the dark, which is due to the slow combustion of this element, which oxidizes at a very low temperature.

Photography.—The action of light on chloride of silver was known as early as the sixteenth century. The phenomenon was studied by Scheele (1777), Senebier (1790), Ritter and Wollaston (1801). From the results of these investigations, experiments were made by Thomas Wedgwood and Humphry Davy, which were published, 1802. Wedgwood may be regarded as the first photographer. His paper was entitled "An Account of a method of copying paintings upon glass, and of making profiles by the agency of light upon nitrate of silver." Further discoveries were made by Niepce in 1814, and by Sir J. Herschel in 1819. Daquene commenced his experiments in 1824; and in 1826 joined Niepce, and worked with him till the death of the latter in 1833. In 1839, Henry Fox Talbot first published his mode of multiplying photographic impressions, by producing a negative photograph (*i. e.*, with the lights and shades reversed), from which any number of positive copies may be obtained. His patent is dated February, 1841. From this time improvements have been made with great rapidity.

Celestial photography began with Professor Bond, the astronomer, of Cambridge, Mass., in 1851. It was greatly improved by Dr. Draper in 1859 to 1881, and by others more recently.

Photogravure.—The earliest attempt at photographic engraving dates back to 1827, which was six years previous to the introduction of the daguerreotype process, and was the invention of M. Nicephore Niepce of Paris, who first discovered that thin plates of bitumen were curiously affected by light. He therefore coated metal plates with a thin layer of bitumen of the kind called Jew's pitch, and placed them in a *camera obscura*, so arranged that he could insure their exposure to the same image for several hours. The plate was then submitted to the action of oil of spike, which readily dissolved those portions not acted upon by the light, but exerted little action upon the remainder. The metal exposed by the solution of the bitumen was then acted upon by acid, which produced a complete

etching plate, the picture part being protected by its bituminous varnish from the action of the acid. The art, which can now be performed by several different methods, is also known by the names of photo-zincography and process-engraving. In ordinary zincography the picture is laid, by the help of transfer paper, on a zinc plate; the parts to be protected are then covered with a varnish that will resist acid, and the whole is then dipped in a bath of dilute nitrous acid. This is repeated until the *biting-in* is sufficient, when the plate is dried and the ink taken off with benzine. In another process brass plates are used, which are covered with white wax, the design being drawn with an etching point upon the wax. The plate is then submitted to a powerful acid, which acts upon the parts of the metal exposed by the lines, but does not affect the wax. In photo-zincography the drawing is photographed to the right size, and an ordinary negative on glass is taken. This is then laid on a sensitized zinc plate, on which the picture is printed by the action of light. The zinc is coated with bitumen, and after the picture is printed, so much of the bitumen as has not become insoluble by the action of light is removed by a wash of turpentine. In another process—the photographic etching process—the negative is printed on a sensitized carbon paper, which is then laid on a polished zinc plate, and, being wet, all the carbon paper that does not hold the lines of the drawing is readily removed. The plate is then *bitten-in* in an acid bath. In what is called the Ives process a negative is applied to a gelatine plate, sensitized with bichromate of potash. This plate is then put into water, and all the parts not touched by the negative will swell. A cast is then taken of this in plaster of paris, which serves to form a base for electrotypes. The lines of engraving can also be reproduced by photography, and a late process produces successfully intaglio plates. Photo-engraving has enormously cheapened the reproduction of pictures, but it does not give plates that print with the clearness and distinctness of those taken from wood engravings.

Physics has been described as a science of unbounded extent, and as reaching from an atom to God himself. It is made to embrace the entire doctrine of the bodies and existences of the Universe: their phenomena, causes, and effects. Lockwood would include God, angels, and spirits under this term. The origin of physics is referred to the Brahmins, magi, and Hebrew and Egyptian priests. From these it was passed to the Greek sages, particularly Thales, who first professed the study of nature

in Greece, about 595 B. C. Pythagoras endeavored to explain the philosophy of disease and the action of medicine, about 529 B. C. From him, together with Plato and the Peripatetic Schools, it descended into Italy and the rest of Europe.

Pianoforte.—Invented by Schröter of Dresden, in 1717; he presented a model of his invention to the court of Saxony. Some time after, Silberman, a musical-instrument maker, began to manufacture pianofortes with considerable success. The invention has also been ascribed to Cristofalli, an Italian instrument maker of Florence, and Marius, a Frenchman, early in the eighteenth century. The square pianoforte was first made by Friederici, an organ builder of Saxony, about 1759. Pianofortes were made in London by M. Zumpie, a German, 1766, and have been since greatly improved by Clementi, Broadwood, Collard, Kirkman, Erard, Pleyel, Chickering, Steinway, and others. Upright pianos, first made in the United States, were suggested by Isaac Hawkins, in 1800, and Thomas Loud, in 1802.

Pins are first mentioned in the statutes of England, A. D. 1483. Brass pins were brought from France in 1540, and were first used in England it is said by Catherine Howard, queen of Henry VIII. Before the invention of pins both sexes used ribbons, loop holes, laces with points and tags, clasps, hooks and eyes, and skewers of brass, silver, and gold. Pins were made in England in 1543. They were first manufactured by machinery in 1824, under a patent of Lemuel Wellman Wright of the United States.

Playing-Cards.—The invention of playing-cards has been variously attributed to India, China, Arabia, and Egypt. There seems to be but little doubt that they originated in Asia, and were introduced into Europe by the Saracens about the close of the thirteenth century. There is historical mention of the game of cards in Germany in 1275, in Italy in 1299, but not in France until 1393. An active trade in cards sprung up in Germany as early as the fifteenth century, where they were manufactured for other portions of Europe. One hundred years later we find the manufacture of cards a flourishing business in England, and under Edward IV. their importation was forbidden, thus protecting the home industry. Owing to their supposed immoral influences they were at times prohibited by various European governments. The marks upon the suits of cards are believed to have been chosen to represent symbolically the different classes of society. Thus, the hearts stood for the clergy, clubs for the soldiery, spades for the

serfs, and diamonds for the merchants. In the early French cards the kings were pictures of David, Alexander, Caesar, and Charlemagne, representing the monarchies of the Jews, Greeks, Romans, and French; the queens were Argine, Esther, Judith, and Pallas. The number of the cards, the ace, and the knave, were probably based on similar ideas. The suits of the earliest German cards were designated by hearts, bells, leaves, and acorns. Italian cards had swords, batons, cups, and money. The court cards at first were the king, chevalier, and knave. The queen was first substituted for the chevalier by the Italians. The English cards in the seventeenth century were embellished with heraldic designs, the king of clubs bearing the coat-of-arms of the Pope of Rome, and those of hearts, diamonds, and spades being adorned respectively with the armorial device of the kings of England, Spain, and France. The club of modern cards derived its form from the trefoil, a French design. A pack of Hindustani cards in the possession of the Royal Asiatic Society of England is supposed to be fully 1,000 years old. It consists of eight suits of divers colors. The kings are mounted on elephants; the viziers, or second honors, upon horses, tigers, and bulls; and some of the common cards have such curious marks as a pineapple in a shallow cup, and a something like a parasol without a handle, and with two broken ribs sticking through the top.

Post Offices, Origin of.—The name post office originated in the posts placed at intervals along the roads of the Roman Empire, where carriers were kept in readiness to bear dispatches and intelligence; but the posts of ancient times were never used for the conveyance of private correspondence. The first letter post seems to have been established in the Hanse towns in the early part of the thirteenth century. A line of letter posts followed, connecting Austria with Lombardy, in the reign of the Emperor Maximilian, which are said to have been organized by the princes of Thurn and Taxis; and the representatives of the same house established another line of posts from Vienna to Brussels, connecting the most distant parts of the dominions of Charles V. In England, in early times, both public and private letters were sent by messengers, who, in the reign of Henry III. wore the royal livery. They had to supply themselves with horses until the reign of Edward I., when posts were established where horses were to be had for hire. Camden mentions the office of "Master of the Postes" as existing in 1581, but the duties of that officer were probably connected exclusively with the

supply of post horses. A foreign post for the conveyance of letters between London and the Continent seems to have been established by foreign merchants in the fifteenth century; and certain disputes which arose between the Flemings and Italians regarding the right of appointing a postmaster, which were referred to the privy council, led to the institution of a "Chief Postmaster of England," who should have charge both of the English and the foreign posts. Thomas Randolph was the first Chief Postmaster of England, appointed in 1581. In 1635 a mail was established to run weekly between London and Edinburgh, and soon eight other lines were instituted. Far back in the twelfth century the University of Paris, whose students gathered from all the civilized nations, employed foot runners to carry letters for its members to all parts of Europe. But not until 1524 was permission granted to the Royal French posts to carry other letters than those for the Government and the nobility. In the United States, Massachusetts was the first colony to provide by legislation for a postal system. This was done in 1639, and Virginia followed in 1657. In 1762 a monthly post was instituted between Boston and New York. In the beginning, letters arriving in this country from beyond the seas were delivered on board the ship. Letters not called for were left by the captain at a coffee house near the wharf, where they were spread on a table or shelf, awaiting call. These coffee houses gradually grew into common use for letters between cities and the interior, until regular posts were instituted. The establishment of a general post office department was one of the first acts of the Continental Congress, and Benjamin Franklin was appointed as the first Postmaster-General.

Postage Stamps, First.—Postage stamps, in the form of stamped envelopes, were first used by M. de Velay, who owned a private post in the city of Paris in the reign of Louis XIV. Over a century later, in 1758, M. de Chamouset, also the proprietor of a post, issued printed postage slips to be attached to letters. In Spain, in 1716, and in Italy also, stamped covers for mail matter were tried; but it was not until 1840 that stamps, as we know them now, were put in use. This was in England, the Government adopting the system devised by Rowland Hill. Brazil was the first country to take up the new invention. Russia adopted the postage stamp next, in 1845; then Switzerland, in 1846; and March 3, 1847, the Congress of the United States authorized the issue of postage stamps. These were at first a five-cent stamp and a ten-cent stamp. The reduction of rates in 1851 gave a

new set of stamps, valued at one, three, and twelve cents respectively. Other stamps of different values were added from time to time to meet the exigencies of postal arrangements, reduction of postage to foreign countries, etc. Before 1845, the postal rate on letters in the United States varied from six cents for carrying a distance of thirty miles to twenty-five cents for over four hundred miles. By the reduction of that year the postage was made five cents for three hundred miles or less, and ten cents for any distance above that. In 1851 the rate was fixed at three cents for every half ounce for three thousand miles, and six cents for any greater distance within the United States. In 1883 the postage was reduced to two cents for half an ounce for letters sent less than three thousand miles, and in 1885 to two cents an ounce.

Potatoes.—The potato was used as a food in America long before the advent of Europeans, and was probably indigenous from Chili to Mexico. It was taken from Peru to Spain, and thence into the Netherlands, Burgundy, and other parts of Europe early in the sixteenth century. In 1563 or 1565 it was carried from Virginia to Ireland by Sir John Hawkins, and Sir Francis Drake introduced it into England in 1585. Its importance as a vegetable was not recognized, however, until the time of Sir Walter Raleigh, who cultivated it on a considerable scale on his estates in the County of Cork, Ireland. Through the exertions of Raleigh it was developed in quality and popularized as food to such an extent in Ireland that its cultivation spread into England, where it became known as the "Irish potato." The potato mentioned by early English writers before the seventeenth century was the same as the Spanish batatas, or sweet potato.

Printing Crockery.—Common crockery, when it is in the state called biscuit ware—that is, when it has been whitened by baking but has not been glazed—is figured upon or decorated by applying to its surface a design freshly printed upon paper. The ware absorbs the enamel ink, and the paper is removed by water. It is then fired in seggars, or a muffle, to fix the color, dipped in glaze, and then again fired, which converts the glaze into a perfectly transparent glassy covering all over the surface of the pottery. Porcelain decoration has long held a high rank as a fine art; and the exquisite skill shown in some of the finest works of the continental manufacturers, and also in those of Great Britain, has fairly entitled it to that rank. The colors employed are all colored glasses ground to impalpable powder, and mixed with borax, or some other

fluxing material; for use they are generally made liquid with oil of spike, and they are laid on with hair pencils in the same way as oil colors. The whole process is exactly the same as in painting or staining glass, the glaze on the biscuit porcelain being true glass, and the enamel colors being exactly the same as those used by the glass decorator. Peculiar and beautiful metallic lusters are produced upon pottery by precipitated platinum and other metals. The manufacture of pottery is carried on with great activity at Trenton, N. J., Philadelphia, Liverpool (in Ohio), and other places in the United States.

Printing in America.—Printing was introduced into America at Mexico by the Viceroy Mendoza in 1536. The first book printed was the *Escala espiritual de San Juan Climaco*, of which no copy is known to exist; but the oldest American book now extant is the *Manual de Adultos*, dated 1540, of which only the last four leaves are to be found in the library of the Cathedral of Toledo. The name of the earliest printer is a matter of question.

Cambridge, Massachusetts, is entitled to the distinction of having the first printing press in North America, which was under the charge of Stephen Daye. For this press the colony was mainly indebted to the Rev. Jesse Glover, a nonconformist minister possessed of a considerable estate, who had left England to settle among his friends in Massachusetts. Some gentlemen of Amsterdam also "gave towards furnishing of a printing press with letters, forty-nine pounds and something more." This was about 1638. The first book issued was the *Bay Psalm Book*, in 1640.

The first book issued in the Middle Colonies was an almanac, printed by William Bradford in 1685, near Philadelphia. Bradford was brought out from England in 1684 by William Penn. As the government of Pennsylvania became very restrictive in regard to the press, Bradford in 1693 removed to New York, and was appointed printer to that colony, where he established, in 1725, the *New York Gazette*, the first newspaper published there. He died May 23, 1752, after an active and useful life of eighty-nine years.

The first newspaper in America was the *Boston News Letter*, which was first issued by John Campbell on Monday, April 24, 1704; it was regularly published for nearly seventy-two years. The second was the *Boston Gazette*, begun December 21, 1719. The third was the *American Weekly Mercury*, issued in Philadelphia, by Andrew Bradford, on December 22, 1719. James Franklin, an elder brother of Benjamin, established the *New England Courant*, August 17, 1721.

The oldest living paper of the United States is the *New Hampshire Gazette*, published at Portsmouth, New Hampshire, and founded in the year 1756.

The *North American and United States Gazette* leads the existing daily press of this country in point of antiquity. It is the successor of the *Pennsylvania Packet* (begun in 1771 and becoming a daily paper in 1784), and is still the chief commercial journal of Philadelphia.

The first paper mill in America was established near Germantown, Pa., in 1690, by William Rittenhouse.

Ptolemaic System, The.—Ptolemy of Alexandria (A. D. 130-150) was the founder of a theory called the Ptolemaic system, based largely upon the materials gathered by previous astronomers, such as Hipparchus, already mentioned, and Eratosthenes, who computed the size of the earth by means even now considered the best—the measurement of an arc of the meridian. The advocates of the Ptolemaic theory assumed that every planet revolves in a circle, and that the earth is the fixed center around which the sun and the heavenly bodies move. They conceived that a bar, or something equivalent, is connected at one end with the earth; that at some part of this bar the sun is attached; while between that and the earth, Venus is fastened, not to the bar directly, but to a sort of crank; and farther on, Mercury is hitched on in the same way. They did not fully understand the nature of these bars—whether they were real or only imaginary—but they did comprehend their action, as they thought; and so they supposed the bar revolved, carrying the sun and planets along in a large circle about the earth; while all the short cranks kept flying around, thus sweeping each planet through a smaller circle.

The movements of the planets were to the ancients extremely complex. Venus, for instance, was sometimes seen as "evening star" in the west; and then again as "morning star" in the east. Sometimes she seemed to be moving in the same direction as the sun, then, going apparently behind the sun, she appeared to pass on again in a course directly opposite. At one time she would recede from the sun more and more slowly and coyly, until she would appear to be entirely stationary; then she would retrace her steps, and seem to meet the sun. All these facts were attempted to be accounted for by an incongruous system of "cycles and epicycles."

The system of Ptolemy passed current for 1400 years, and during this time astrology was ranked as one of the most important branches of knowledge. Star diviners were held in the greatest estimation, and the issue of any im-

portant undertaking, or the fortune of an individual, was foretold by means of horoscopes representing the position of the stars and planets. The system of the astrologers was very complicated, and contained regular rules to guide the interpretation, so intricate that years of study were required for their mastery. Venus foretold love; Mars, war; the Pleiades, storms at sea. Not only the ignorant were the dupes of this system, Lord Bacon believing in it most firmly.

Pulley.—The pulley, together with the vise, and other mechanical instruments, is said to have been invented by Archytas of Tarentum, a disciple of Pythagoras, about 516 B. C. Ctesibius of Alexandria, architect and mechanic, is said to have invented the pump, with other hydraulic instruments, about 224 B. C., although the invention was ascribed to Danaus, 1485 B. C. They were in general use in England, A. D. 1425. The air pump was invented by Otto Guericke in 1654, and was improved by Boyle in 1657.

Rainbow.—A rainbow can only be seen when the spectator stands between it and the sun; its center must always be directly opposite the sun, moving with the sun's motion, falling if the sun is rising, and rising if the sun is declining. A rainbow occurs when the sun or moon, not too far above the horizon, throws its beams upon a sheet of falling raindrops on the opposite side of the heavens. Thus, a ray of light from the sun strikes a rain-drop obliquely; part of it is reflected at the surface of the drop; the rest, passing into the drop, is refracted; on the other side of the drop part of the ray passes through, and the rest is again reflected; on passing from the drop on the same side that it entered, a second refraction occurs. These successive reflections and refractions separate the ray of white light into its component colored rays, and as the angles of incidence and emergence vary for each color, the eye of a spectator perceives them as distinct bands. Now, every drop in the sheet of falling water which has equal obliquity to the spectator's eye will send it rays of the same color. But the only drops which can fulfill these conditions of like obliquity of reflected rays are those which define the base of a cone whose apex is the eye, and the center of whose base is in a right line passing through the sun and the eye of the spectator. At or near sunset, when the sun and the observer are in the same horizontal plane, the bow will be seen to form a complete semicircle; when the sun is higher in the sky, a smaller arch is seen; the entire circle could only be visible to a spectator on the top of a very high and narrow mountain peak, which would ele-

vate his plane much above that of the sun's rays without cutting off their light. A complete circle may also be sometimes seen in the rainbow formed by the sunlight on the spray arising from cataracts. The lunar rainbow, which is a comparatively rare but very beautiful phenomenon, differs from the solar simply in the source and intensity of the light by which it is produced; and, as in all cases of feeble light, the distinction of the colors is very difficult. In fact, except under the most favorable circumstances, the lunar rainbows rarely show colors at all, giving a pale, ghostly gleam of apparently white or yellow light.

Reaper, First in the United States.

—In 1803 a reaping machine was patented by Richard French and John J. Hawkins, but it did not prove successful. Prior to 1832 there were granted eight patents for machines for cutting grain. No inventor, however, succeeded in producing machines that possessed sufficient practical merit to be used otherwise than experimentally until we come to Bell, Hussey, and McCormick, whose machines have since become so well known. At the meeting of the British Association at Dundee, September, 1867, the Reverend Patrick Bell stated that he invented his reaping machine in 1826. McCormick's American machine was patented in 1834, and, with improvements added in 1845 and 1847, received a medal at the World's Fair in London, 1851. In 1833, Obed Hussey, then of Cincinnati, Ohio, patented a machine to which he applied saw-toothed cutters and guards. This machine was at once put into practical operation, and gave general satisfaction. Hussey, in 1847, patented the open-topped slotted finger. The practical use of self-rakers, in this country, dates from the invention of W. H. Seymour of New York, in 1851. He arranged a quadrant-shaped platform directly behind the cutters, a reel to gather the grain, and a rake moving over the platform in the arc of a circle depositing the sheaves on the ground. In 1856, Owen Dorsey of Maryland combined the reel and rake, and his improvement has been extensively used here and abroad, with some modifications, one of which was by Johnston in 1865, who arranged it so that the size of the sheaves, or gavels, as they are called, could be regulated at the will of the driver. The names of Haines, Ketchum, Manny, and Wood are prominent among inventors of improvements in mowers and harvesters.

Saddles.—Pliny informs us that one Pelethronus was the first to introduce a piece of leather fastened to the back of a horse for the accommodation of its rider. For a long time these cloths and pieces of leather were regarded

as unmanly, and were consequently treated by soldiers with great scorn. The old German races despised the Roman cavalry for riding on such effeminate contrivances. Saddles of the kind now used appear to have been in use in 385. Side-saddles were first used in 1380. Previous to their introduction women always rode astride.

Salt, Sources of.—At one time nearly the whole of the salt used as food and for industrial purposes was obtained from sea-water, and in many countries where the climate is dry and warm and there is a convenient seaboard, large quantities are still so obtained. In Portugal more than 250,000 tons are annually produced, and about the same quantity is obtained on the Atlantic and Mediterranean coasts of France. Spain has salt-works in the Balearic Islands, the Bay of Cadiz, and elsewhere, which turn out annually 300,000 tons; and even the small Adriatic seaboard of Austria produces every year from 70,000 to 100,000 tons. The peninsula and islands of Italy yield about 165,000 tons, and there are still a few establishments in England and Scotland; but in these latter countries the industry has been almost entirely driven out by the rock-salt works. The salt obtained from this source is called "sea" or "bay" salt. The works are generally called salt gardens—*salina* (Spanish)—*salz garten*, in Austria. They consist of a series of large, shallow evaporating reservoirs. The sea water is admitted, and flows slowly from one to another, all the while evaporating under the heat of the sun, until finally the dry salt remains in crystalline crusts on the salting-tables in the final basins. These reservoirs vary from ten to sixteen inches in depth, the sediment and many of the impurities being deposited in the earlier and deeper basins in the first stages of evaporation. Between the temperatures of 25 and 26 degrees (Baumé) pure salt is deposited, equal to about twenty-five per cent. of the whole. This is kept pure by conducting the brine to separate salting-tables at this temperature, and, after it reaches 26 degrees, carrying it on to other basins, where a second quality, equal to about sixty per cent. of the whole, is formed. After the brine reaches 28.5 degrees it is led into still other basins, where the remainder of the salt is deposited. The salt is raked up and sold just as it is formed, with the slight purification resulting from a few months' exposure to the weather, which is customary. The evaporating surface of these shallow basins covers, in many establishments, hundreds of acres. Those at Berre, on the Mediterranean, have an area of 815 acres. Sea-salt has been obtained in this way in many of the seaboard

States of the United States, but not to any extent. The other great source of common salt is the vast mineral deposits. Salt also occurs as a mineral in an almost pure state, and associated with the rocks of almost every geologic period. Many of the deposits are of vast extent, and are another great commercial source of this substance. This mineral deposit is called rock-salt, and is evidently the result of the evaporation of great shallow bodies of salt-water in remote ages, as is proved by its generally stratified nature, with beds of clay intervening, and the occurrence of marine shells and fossils in the surrounding rock formation. Large mines are worked in England and all the European countries, and in many places throughout the world. The most famous of all is the mine at Williczka, nine miles from Cracow, in Galicia, which has been worked continuously for upward of six hundred years. It is stopped-out in longitudinal and transverse galleries, with frequent large vaulted chambers supported by massive pillars. These extend on four different levels, and have a total length of 30 miles, the mine being 1 mile 1,279 yards long by 830 yards wide and 284 yards deep. The lower levels contain streets and houses, constituting a complete village; and many of the miners, of whom there are 800 to 1,000, rarely come above ground. The salt is sold just as it is dug out of the mine, and 55,067 tons are annually extracted. The total extent of this deposit is 500 by 200 miles, with an average depth of 1,200 feet. Salt is also obtained in many localities from mineral deposits by means of salt-wells. In some cases the water occurs naturally in the salt strata, and the saturated brine is reached by deep borings (sometimes 1,500 feet); in other cases water is introduced into the borings and then pumped out again, two concentric tubes being employed. After the brine is secured it is evaporated by artificial heat in large iron vats. The salt-wells in Onondaga County, New York, near Syracuse and Salina, are a large and important industry. Michigan has the largest output next to New York, and many other States produce it to some extent; but the home supply is not equal to the demand, and there is a large annual importation into the United States.

Saw.—Invented by Dædalus. Talus, it is said, having found the jaw bone of a snake, employed it to cut through a piece of wood, and then formed an instrument of iron like it. Sawmills were erected in Madeira in 1420; at Breslau in 1427. Norway had the first sawmill in 1530. The attempts to introduce sawmills in England were violently opposed, and one erected by a Dutchman in 1663 was

forced to be abandoned. Sawmills were erected near London about 1770, and thenceforward became genera.

Screw Propeller, The.—In 1802 Dr. Shorter, an English mechanician, produced motion by the agency of a screw; but his discovery was of no value at the time, as the steam engine had not then been applied to navigation. In 1832, Mr. B. Woodcroft patented a screw propeller with an increasing pitch; and four years later Mr. F. P. Smith patented a screw making two whole turns, which he reduced in 1839 to one whole turn. In 1837 he and Captain Ericsson brought the matter practically forward on the Thames, where a small screw steamer, forty-five feet long, eight feet broad, and of twenty-seven inches draught, towed a vessel of six hundred and thirty tons against the tide at four and one half knots an hour. This experiment was followed by a number of others, some undertaken under the direction of the British Admiralty, which clearly established the practicability of the screw, and its advantages for ships of war became incontestable. From the entire submergence of the propeller, and the consequent lowness of its engines in the ship, the chances of injury from an enemy's shot were reduced almost to nothing. The screw propeller is of the same construction as the common screw, but with the narrow thread exaggerated into a broad, thin plate, and the cylinder diminished to a mere spindle. If a screw of this form were turned round in an unyielding substance, as wood, it would for each turn advance as much as the center of the blade (or thread) had moved along the spindle in forming the screw, *i. e.*, the distance. If, on the other hand, the screw itself were prevented from moving longitudinally, and the piece of wood *not* fixed, the latter would be compelled to advance along the screw the same distance. When the screw is fixed beneath a ship and made to revolve in the water, the case lies between the two just supposed—the screw moves forward, and with it the ship, and the water in which it has been working moves backward. The backward motion should only be small proportionately, and the ratio between it and the sum of the backward motion of the water and the forward motion of the ship is called the slip. Screws have been formed with two, three, four, and six blades, or arms; but the form most commonly used is two blades for ships of war, and three or four blades in the merchant service.

Ship Building.—This art is attributed to the Egyptians, as the first inventors; the first ship (probably galley) being brought from Egypt to Greece by Danaus, in 1485 B. C.

The first double-decked ship was built by the Tyrians, 786 B. C. The first double-decked one built in England was by order of Henry VII., 1509. It was called the Great Harry and cost 14,000 pounds. Portholes and other improvements were invented by Descharges, a French builder at Brest, in the reign of Louis XII., about 1500. Ship building was first treated as a science by Hoste, 1696. Iron is now greatly used in ship building. For beautiful models and fast sailing, the shipping of the United States (especially the packet ships and steamers sailing from New York) is not surpassed, and probably not equaled, by that of any other nation in the world.

Signals, Wind and Weather.—A red flag with a black center indicates that a storm of marked violence is expected. A yellow flag with a white center indicates that the winds expected will not be of extreme severity. A red pennant indicates easterly winds—that is, from northeast to south, inclusive, and that, generally, the storm center is approaching. If shown above the red flag, winds from the northeast are more probable; if below, winds from the southeast may be expected. A white pennant indicates westerly winds—that is, from north to southwest, inclusive, and that, generally, the storm center has passed. If shown above the red flag, winds from northwest will probably prevail; if below, winds from southwest. A white flag indicates fair weather. A blue flag indicates rain or snow. A black triangular flag refers to temperature; when placed above the white or blue flag it indicates warmer weather; and when placed below them, colder weather. A white flag with black square in center indicates the approach of a sudden and decided fall in temperature, and is usually ordered at least twenty-four hours in advance of a cold wave. When displayed on poles, the signals are arranged to read downward; when displayed from horizontal supports, a small streamer is attached to indicate the point from which the signals are to be read.

Silkworm.—It is the general belief that the great importance of the silkworm was first discovered by Se-ling, the wife of the Chinese Emperor Hoangti, who reigned about 2637 B. C., and that she also invented and taught the art of silk-spinning and weaving. The worms are exceedingly tender, and liable to perish from the slightest changes of temperature and dampness. They feed upon the leaves of various trees and bushes, but experiments go to show that the best silk is produced when the worm is fed upon mulberry leaves. The great centers of this industry are China, Japan, India, and Southern Europe, and they have

been successfully raised in California, Ohio, Kansas, East Tennessee, Northern Georgia, Kentucky, and in some parts of New Jersey.

Soap is a salt, a compound of fatty acid with an alkali, soda, or potash. The Hebrew borith, translated soap, is merely a general term for cleaning substances. Pliny declares soap to be an invention of the Gauls, though he preferred the German to the Gallic soap. In remote periods clothes were cleansed by being rubbed or stamped upon in water. Homer tells us that Nausicaa and her attendants washed clothes by treading upon them with their feet in pits of water. The Roman's used fuller's earth. Savon, the French word for soap, is ascribed to its having been manufactured at Savona, near Genoa. The manufacture of soap began in London in 1524, before which time it was supplied by Bristol at one penny per pound.

Soaps, Natural.—From time immemorial the Egyptian soaproot and the Spanish soaproot have been employed for washing in Southern Europe and Egypt, and are, to some extent, exported for use in cleansing fine articles. In the West Indies and South America, a pulpy fruit, which grows on a tree known as the soap-tree, is said to have such cleansing properties that it will clean as much linen as sixty times its weight of manufactured soap. There is also a tree in Peru, *Quillaja Saponaria*, whose bark, in infusion, yields a soapy liquid much valued for washing woolens, and is largely imported to England and other countries for this purpose. The juice of the soapwort, or, as it is commonly called in the United States and Great Britain, the "Bouncing Bet," strongly possesses the saponaceous qualities. In California the roots of the *Phellangium Pomaridianum*, which grows there abundantly, are much used for washing. This plant has a strong odor of brown soap in its leaves and stems, as well as the roots. The South Sea Islands and the islands of the Caribbean Sea also produce plants which are used as soap substitutes.

Solar System, The.—So named from *sol* (Latin), the sun, consists of the sun in the center, numerous planets, and an unknown number of bodies named comets. The word planet is from the Greek *planao*, to wander, because the few such bodies known to the ancients were chiefly remarkable in their eyes on account of their constantly shifting their places with reference to the other luminaries of the sky. Comets are so named from *coma* (Latin), a head of hair, because they seem to consist of a bright spot, with a long brush streaming behind.

Some of the planets have other planets mov-

ing round them as centers—the moon, for instance, round the earth. These are called secondary planets, moons, or satellites; while those that move round the sun are called primary planets. The primary planets consist—1st, of eight larger planets, including the Earth; their names, in the order of their nearness to the sun, are—Mercury, Venus, the Earth, Mars, Jupiter, Saturn, Herschel or Uranus, and Neptune. 2d. A group of small planets or planetoids, called also asteroids, considerable in number. The discovery of a new asteroid by Professor Borelli, places the entire number of planets in the solar system at one hundred and eighteen, against six known in 1781, when Sir W. Herschel discovered Uranus.

The planets move round the sun on nearly one level or plane, corresponding with the center of his body, and in one direction, from west to east. The secondary planets, in like manner, move in planes round the centers of their primaries, and in the same direction, from west to east. These are denominated revolutionary motions; and it is to be observed that they are double in the case of the satellites, which have at once a revolution round the primary, and a revolution, in company with the primary, round the sun. The path described by a planet in its revolution is called its orbit.

Each planet, secondary as well as primary, and the sun also, has a motion in its own body, like that of a bobbin upon a spindle. An imaginary line, forming, as it were, the spindle of the sun or planet, is denominated the axis, and the two extremities of the axis are called the poles. The axes of the sun and planets are all nearly at a right angle with the plane of the revolutionary movements. The motion on the axis is called the rotary motion, from *rota*, the Latin for a wheel. The sun, the primary planets, and the satellites, with the doubtful exception of two attending on Uranus, move on their axes in the same direction as the revolutionary movements, from west to east.

| NAME. | Mean Distance From Earth in Millions of Miles. | Mean Distance From Sun, Millions of Miles. | Sidereal Period, Days. | Orbit Velocity, Miles per Second. | Mean Diameter, Miles. |
|--------------|--|--|------------------------|-----------------------------------|-----------------------|
| Sun..... | 92.9 | | | | 866,400 |
| Mercury..... | 56.9 | 36.0 | 87.969 | 23 to 35 | 3,030 |
| Venus..... | 25.7 | 67.2 | 224.701 | 21.9 | 7,700 |
| Earth..... | | 92.9 | 365.256 | 18.5 | 7,918 |
| Mars..... | 48.6 | 141.5 | 686.950 | 15.0 | 4,230 |
| Jupiter..... | 390.4 | 483.3 | 4,332.58 | 8.1 | 86,500 |
| Saturn..... | 793.2 | 886.0 | 10,759.22 | 6.0 | 71,000 |
| Uranus..... | 1,689.0 | 1,781.9 | 30,686.23 | 4.2 | 31,900 |
| Neptune..... | 2,696.8 | 2,791.6 | 60,181.11 | 3.4 | 31,800 |

The number of asteroids discovered up to present dates is 330. A number of these small

planets have not been observed since their discovery, and are practically lost.

It is supposed that α Centauri, one of the brightest stars of the Southern Hemisphere, is the nearest of the fixed stars to the earth. The researches on its parallax by Henderson and Maclear gave it for its distance from the earth, in round numbers, 20,000,000,000,000 of miles. It would require three years and three months for light to reach the earth from this star.

Wireless Telegraphy.—In 1888, Heinrich Hertz, a German, paved the way for the development of wireless telegraphy, when he proved by experiment that waves of electricity follow the same laws as light waves, and showed how to produce electric waves and detect them by physical means. Starting with these principles, by adaptation and improvement of existing inventions for detecting electric waves, in 1896 Marconi originated the first long distance wireless telegraph. In December of 1901, he had so improved his apparatus as to be able to signal across the Atlantic.

Wireless messages are sent by means of a transmitter and received by a detecting instrument. The transmitter consists of (1) a battery composed of a number of smaller batteries such as are used in the telegraph and telephone. These are joined together, except at one point where the unconnected ends of the battery form its poles. These are two polished brass balls placed so as to be but a fraction of an inch apart. After the tension of the battery's current has been increased by passing it through a transformer, it has sufficient strength for overcoming the resistance of the air between the poles, and it jumps from one to the other in the form of a spark. Now from this spark electric waves or pulsations are sent out through space in every direction. (2) A long wire, held in vertical position by means of a high mast or a kite, is attached to one of the brass balls. The electric pulsations from the spark ascend the wire and are radiated off into space. By his control of the current in the battery the operator may make his series of sparks long or short as he desires, and the oscillations sent off by the wire will of course correspond to this series in the length of time which they endure.

The receiving apparatus has a very similar wire arrangement and battery, except that in place of the transformer and brass balls, there is used between the poles of the receiver a peculiar instrument called a detector, to which the vertical wire is attached. Detectors are of several kinds, such as the Fessenden "heat" detector, the Marconi magnetic detector, the DeForest electrolytic detector, but they all

conserve the same purpose. When the electric oscillations from the distant transmitting wire strike the receiving wire they run down it and are detected or noticed by the peculiar effect they have on the detector. In some detectors, this effect is to cause the instrument, before a nonconductor of the battery's current, to allow the current to pass through it until the series of waves ceases to impinge upon it, when it at once becomes again a nonconductor. When this happens, the current operates a Morse instrument and causes it to print a dot or a dash, according as the series of waves is short or long. In another class of detectors, the effect of the series of oscillations is merely to vary a current already passing through the detector, and the variation and its length are noted either by the telegraphic relay or by the telephone receiver.

Specific Gravity is the ratio of the weight of a given bulk of any substance to the weight of the same bulk of a substance taken as the standard. The substance taken as the standard for solids and liquids is water. Representing water as 100, we have the following specific gravities:—

| LIQUIDS. | | TIMBER. | | METALS. | |
|-----------------------|---------|----------------------|---------|----------------------|---------|
| Sea water..... | 102.6 | Cork..... | 24 | Zinc..... | 700 |

Spinning Wheel.—The invention of the art of spinning was ascribed by the ancients to Minerva, the Goddess of Wisdom. It is said that Arcas, the King of Arcadia, taught his subjects the art about 1500 B. C. The use of the spindle and distaff, however, was known in Egypt even earlier than this, as is shown by pictures upon Egyptian monuments. The distaff was a simple stick, around which the fiber

was coiled, and was held in the left hand. The spindle was a species of top, which was set in motion by a twirl of the hand and by combining its rotary motion with a gradual movement away from the spinner. The size of the fiber was equalized by passing it between the finger and thumb of the right hand until the motion of the spindle was exhausted, when the thread was wound around it, and the process was repeated. The improvement upon this method by placing the spindle in a frame, and making it revolve by mechanical action of the hand or foot in connection with a wheel and treadle, constituted the spinning wheel, which, though probably in use long before, cannot be traced farther back than A. D. 1530. The spinning jenny, a machine of eight spindles, was first invented in 1767, and subsequent to that time many improvements in spinning machinery have been made.

Sponges and Sponge Fishing.—Sponges belong to the very lowest order of animal life, and are attached like plants to rocks, or similar substances. Those fit for use are found generally in the seas of warm climates. They consist of a framework, which is sometimes of an elastic fibrous substance, and sometimes is made up of an aggregation of hard, siliceous spicules. A sponge, when fixed to a rock, increases in size by a regular process of growth. To free them from the jelly-like animal matter which they contain when first brought, they are buried for some days in the sand, and are then soaked and washed. In the Turkish sponge fisheries the sponge is obtained by diving, and the diver guides himself beneath the water with a stone, to which a cord from the boat is attached. The best sponges are obtained from eight to ten fathoms below the surface of the water. In the Greek sponge fisheries of the Morea, and on the Bahama Islands, a pronged fork at the end of a long pole is used to detach the sponges from the rocks below. Two species are found in the Levant, another on the Bahamas, and still another on the coasts of Florida and Mexico.

Spontaneous Combustion may be defined as the ignition of inflammable bodies without the application of flame, or without obvious cause of increase of temperature, and arises from the well-understood liability of certain bodies to undergo chemical changes which develop sufficient heat to set them on fire. Recently expressed fixed oils are particularly disposed to oxidize when exposed to light and air. They then absorb oxygen, and give out carbonic acid and hydrogen. If the process goes on rapidly, as it usually does when the oil is diffused through light inflammable sub-

stances, as cotton, tow, the waste used in lubricating machinery, oatmeal, etc., the heat may be sufficient to set them on fire. Bituminous coal lying in large heaps is liable to be ignited by the heat evolved in the decomposition of the sulphuret of iron which it commonly contains. The rapid absorption of water by quicklime is also attended with development of heat sufficient to ignite combustible bodies in contact with the lime. Strong nitric acid will act on straw, hay, and such bodies, so as to render them spontaneously combustible.

Stars, The.—The idea at which astronomers have arrived respecting the stars, is, that they are all of them suns, resembling our own, but diminished to the appearance of mere specks of light by the great distance at which they are placed. As a necessary consequence to this supposition, it may be presumed that they are centers of light and heat to systems of revolving planets, each of which may be further presumed to be the theater of forms of beings bearing some analogy to those which exist upon earth.

The stars seen by the naked eye on a clear night are about two thousand in number. This, allowing a like number for the half of the sky not seen, gives about four thousand, in all, of visible stars. These are of different degrees of brilliancy, probably in the main in proportion to their respective distances from our system, but also, perhaps, in some measure in proportion to their respective actual sizes. Astronomers class the stars under different magnitudes, not with regard to apparent size, for none of them present a measurable disc, but with a regard to the various quantities of light flowing round them; thus, there are stars of the first magnitude, the second magnitude, and so on. Only six or seven varieties of magnitude are within our natural vision; but with the telescope vast numbers of more distant stars are brought into view; and the magnitudes are now extended by astronomers to at least sixteen.

Steam Engines.—The application of steam as a moving power is claimed by various nations, but the first extensive employment of it, and most of the improvements made upon the steam engine, the world indisputably owes to the English and the Americans. It would appear that as early as 1543 a Spanish captain named Blasco de Garay showed in the harbor of Barcelona a steamboat of his own invention. It is most likely that Blasco's engine was on the principle of the *Æolipile* of Hero, invented 130 B. C., in which steam produces rotatory motion by issuing from orifices, as water does in Barker's mill. The preacher Mathesius, in his sermon to miners in Nurem-

berg in 1562, prays for a man who "raises water from fire and air," showing the early application of steam power in Germany. An Italian engineer, G. Branca, invented in 1629 a sort of steam windmill, the steam being generated in a boiler, which was directed by a spout against the flat vanes of a wheel, which was thus set in motion. In England, among the first notices we have of the idea of employing steam as a propelling force is one contained in a small volume, published in 1647, entitled "The Art of Gunnery," by Nat. Nye, mathematician, in which he purposes to "charge a piece of ordnance without gunpowder" by putting in water instead of powder, ramming down an air-tight plug of wood and then the shot, and applying a fire to the breech "till it burst out suddenly." But the first successful effort was that of the Marquis of Worcester. In his "Century of Inventions," the manuscript of which dates from 1655, he describes a steam apparatus by which he raised a column of water to the height of forty feet. This, under the name of "Fire Waterwork," appears actually to have been at work at Vauxhall in 1656. The first patent for the application of steam power to various kinds of machines was taken out in 1698 by Captain Savery. In 1699 he exhibited before the Royal Society a working model of his invention. His engines were the first used to any extent in industrial operations. In all the attempts at pumping engines hitherto made, including Savery's, the steam acted directly upon the water to be moved, without any intervening part. To Dr. Papin, a celebrated Frenchman, is due the idea of the piston. It was first used by him in a model constructed in 1690. The next great step in advance was made in 1705, in the "atmospheric engine," conjointly invented by Newcomen, Cawley, and Savery. This machine held its own for nearly seventy years, and was very largely applied to mines. The next essential improvements on the steam engine were those of Watt, which began a new era in the history of steam-power. His first and most important improvement was the separate condenser, patented in 1769. He had observed that the jet of cold water thrown into the cylinder to condense the steam necessarily reduced the temperature of the cylinder so much that a great deal of the steam flowing in at each upward stroke of the piston was condensed before the cylinder got back the heat abstracted from it by the spurt of cold water used for condensing the steam in the cylinder. The loss of steam arising from this was so great that only about one fourth of what was admitted into the cylinder was actually available as motive power. This difficulty was overcome by Watt's

invention. The principal improvements that have been made since Watt's time have been either in matters relating to the boiler, in details of construction consequent upon our increased facilities, improved machinery, and greater knowledge of the strength of materials, in the enlarged application of his principle of expansive working, or in the application of the steam engine to the propulsion of carriages and vessels.

Steel, Manufacture of.—Steel, which is a compound of iron and carbon, was used by the Egyptians, Assyrians, and Greeks. The oldest method of making it is the pot-steel process, which consists at first in melting wrought iron with carbon in clay crucibles, and this process is still used to some extent. The direct process of making steel by immersing malleable iron in a bath of cast-iron was first invented in 1722 by Reaumur. Improvements in this manufacture were made in the early part of this century by Mushat and Lucas, and the eminent metallurgist, Heath, first successfully melted the ingredients of cast steel on the open hearth of the reverberatory furnace about 1839. He patented his process in 1845, but it was not regarded as successful until practical conditions were furnished for it by the invention of the Siemens regenerative gas-furnace in 1862. By the Bessemer process, which was first patented in 1855, and which is now the most generally used, twenty tons of crude iron have been converted into cast steel in twenty-three minutes. Sir Henry Bessemer has received in royalty on this process some \$10,000,000. The manufacture of steel has been carried to the highest perfection in the United States, and the output of American steel works is about 800,000 tons yearly.

Steel Pens, Invention of.—During the last century many efforts were made to improve the quill pen, the great defect of which was its speedy injury from use, and the consequent trouble of frequent mending. These efforts were chiefly directed to fitting small metal, or even ruby, points to the nib of the quill pen; but the delicacy of fitting was so great that but very little success attended the experiments. At the beginning of this century pens began to be made wholly of metal. They consisted of a barrel of very thin steel, and were cut and slit so as to resemble the quill pen as closely as possible. They were, however, very indifferent, and, being dear, they made but little way. Their chief fault was hardness, which produced a disagreeable scratching on the paper. In 1820 Joseph Gillett perfected the present form of steel pens and began their manufacture at Birmingham, England. The first gross of steel pens ever

sold at wholesale were sold for \$36, in 1820, at Birmingham. In 1830 the price was \$2; in 1832, \$1.50; in 1860, 12 cents; while an article as good as those manufactured in 1820 was sold at 4 cents. The annual production of steel pens in Birmingham alone ranges from 8,000,000 to 15,000,000 gross.

Stenography.—The art of writing in shorthand is said to have been practiced by the ancients. It is said to have followed from the hieroglyphics of the Egyptians. It is also attributed to the poet Ennius, to Tyro, and still more to Seneca. The *Ars Scribendi Characteris*, written about 1412, is the oldest system extant. Dr. Timothy Bright's "Characterie, or the art of short, swift, and secret writing," published in 1583, is the first English work on shorthand. Peter Bales, the famous penman, wrote on stenography in 1590. There are now numerous systems of it, many of them of easy acquirement and great simplicity. Byrom's system was invented, 1767; Guerne's, 1710; Mason's, 1750; Taylor's, 1786; Mavor's, 1789; Pitman's (phonographic), 1837.

Stereotyping.—The *papier-maché* process, which is the most general, was first used in France in 1848. It is extremely simple. The types being set, corrected, made into pages, and fixed in a frame, are laid upon the stone or table used, face upward, and a little fine oil is brushed over them to prevent the *papier-maché* from adhering to the face of the types. This *papier-maché*, which is used for making the matrix or mold, is formed by pasting upon a sheet of tough brown paper, several sheets of tissue paper, and a sheet of soft, absorbent white paper. It is made in sheets, and usually, to make a matrix of the desired thickness, several sheets are used. It is kept moist for use, and is lightly covered with pulverized French chalk when laid upon the face of the types. Then it is beaten with a stiff brush to force the soft paper into all the interstices of the types. Other sheets of prepared paper are added to secure the desired thickness, and the whole is then covered with a woolen blanket and put into a press, the bed of which is moderately heated, and the press is screwed down. The heat soon dries the matrix, which, when taken out of the press, is a stiff card, showing a perfect reversed impression of the types. A mold of metal is then taken from the matrix, in which the exact face of the types are reproduced for printing. When the plate is to be run on a rotary press, it is cast in a box which is curved inside, so that the form of the plate will fit the cylinder of the press. By this method an entire large plate can be made in a quarter of an hour, or even less time. For fine book work the matrices are made of plaster

of paris, which is a much slower and more costly way, but produces a finer and cleaner plate when finished. This process was invented about 1731.

Suez Canal. One of the most important shipping enterprises known to history. It enables two ships to do the work of three in trading between Europe and the East. From London to Bombay, by way of the Cape, is 10,595 miles; by the canal, 6,330. It cost £17,000,000, was begun in 1859 by DeLesseps, and finished in 1869. Its length is about 100 miles, depth, 28 feet; the tolls from 1900 to 1903 averaged nearly \$5,000 per vessel, or 8½ francs per ton of net tonnage, 10 francs per passenger, and 7 francs for empty ships. In 1900, 3,441 vessels went through, the mean time of passing being 14½ hours. Electric lights are now used to enable ships to pass at night as readily as in the daytime.

Sugar is supposed to have been known to the ancient Jews. Found in the East Indies by Nearchus, admiral of Alexander the Great, 325 B. C. An oriental nation in alliance with Pompey used the juice of the cane as a common beverage. It was prescribed as a medicine by Galen, second century. Brought into Europe from Asia, A. D. 625; in large quantities, 1150. Its cultivation was attempted in Italy, but not succeeding the Portuguese and Spaniards carried it to America about 1510. Sugar cane first grown in the territory now constituting the United States, 1751. First American sugar mill built near New Orleans, 1758. Sugar refining was made known to Europeans by a Venetian, 1503; and was first practiced in England in 1659. The invaluable vacuum pan was invented by Howard, 1812, and Dr. Scoffern's processes were patented in 1848-50.

Sugar manufactured from sorghum was first successfully reported in 1888. The sap of the rock or sugar maple, a tree growing in the United States and Canada, yields a local supply of sugar, which also, in some measure, finds its way into commerce.

Telegraph, The.—The word is Greek, meaning "to write from a distance." The Greeks never thought of doing such a thing. Like most scientific designations, it is a made-up word out of that wonderful tongue. Before Morse's time it had come to mean the giving of any information from afar. The ideas of speech, quick delivery, are involved. If time is not the essential, we may go or send. Indians use columns of smoke. We use signals and the heliograph. Vessels at sea have long used visual telegraphic signals. But as soon as it was known that electricity could be sent long distances over wires, human genius began

to devise means for using it for sending messages. Many of these devices were tried and failed. Some of them seem now to us absurd, because they were attempted before even the battery was invented, when the current was obtained by friction. In 1832 an American, Morse, while on a voyage home from Europe in a sailing vessel, began to think of making what we now know as a telegraph. After more than eight years of waiting, Congress made an appropriation for building a line between Baltimore and Washington. The story of this first line is curious, almost absurd, showing how little the inventor knew when he began it, and how much was learned during its construction. Morse had an assistant named Alfred Vail, who is the author of most of the features of the telegraph which have proved useful, as we now know it.

In principle, and even in practice, the telegraph is one of the simplest of electrical appliances. Any two operators can communicate with each other over a great distance with two parts only; a battery and a wire, for the wonderful alphabet of Vail, the dots and dashes, can be read in any language, and by sight, hearing, tasting, or feeling. Something to produce a current, and a wire to carry it, are all that are absolutely necessary. There is usually only one wire. There would be two, but the earth acts in place of the return wire, and the connection is simply made at the battery, along the wire, and into the ground. The only machine, so to speak, that is necessary in practice is the small electro-magnet which one hears pulling down the armature to it every time a connection is made by the operator at the other end of the circuit who is sending a message, and spelling out the words of it with the click and pause sound which would be the dot and dash of the old roll of paper indented by a pointed stylus, now discarded. This electro-magnet and its action with an interrupted current has been briefly explained. The key with which the message is spelled out is a lever with a button at the end, which, when pressed down, makes a contact and completes the circuit over the wire and the windings of the electro-magnet, and, when released, breaks it again.

Telephone, The.—This wonderful advance in electrical science was made practical in 1875, and is the invention of Prof. A. G. Bell, Chicago. There were simultaneous inventions by Gray, Edison, and others. In reality, the telephone is simple in construction, but it is difficult to explain in words. The human voice, recognizable in articulate words, is apparently carried for miles on a wire. Yet it is well to understand in the be-

ginning that such is not the case. The listener does not hear any person talk. All that goes over the wire is thousands of varying impulses of electricity. The entire secret lies in electrical induction.

It has been shown that electricity produces magnetism. Following it has been shown that this process can be reversed, and that magnetism produces electricity. This last fact was made use of in the original Bell telephone. The Blake transmitter is now used, slightly modifying the action, but not altering the principle of the instrument, and an endeavor to explain this will be made. It has been shown that an approach to, or a receding from, a wire carrying a current, produces an induced current. Then it was shown that if one of the pieces were a magnet, and there was a rapid approach and receding by a piece of soft iron, an induced current would also be produced.

Now there is in the transmitting instrument of a telephone a bar magnet, and on one end of this is wound several layers of fine insulated wire. The ends of this wire run off and become a part of the circuit between two telephones. No current passes over this circuit ordinarily, but one can be induced if a piece of iron is made to move quickly, to tremble, near the bar. This is accomplished by placing crosswise to the end of the bar magnet the thin black disc of sheet-iron against which, so to speak, one talks when using the telephone. The voice impinging upon this, causes it to tremble; to approach to and recede from the magnet, not vaguely and without rule, but precisely in proportion to the *tone* of the voice. Every time one of these very small movements of the disc occurs a small impulse is sent from the magnet out over the circuit whose coil incloses it.

At the other end of the circuit there is a precisely similar arrangement of bar magnet and coil and disc, inclosed in that trumpet-shaped receiving instrument which is held to the ear. The magnetism in this last magnet is increased with each impulse in precise proportion to the power of the impulse, and this disc of the receiving instrument is drawn toward its magnet and released again in unison with the movements of the disc in the transmitter, which movements, as stated, are great or small, or slow or fast, in accordance with the tones of the voice of the speaker.

It follows that the mechanical rattle of a disc of sheet-iron held close to the ear produces sounds that vary in pitch and intensity precisely as those do which are produced by the impinging of the human voice upon the other disc, a mile or more away. The movement of the transmitting disc controls those

of the receiving disc through the medium of varying impulses of electricity sent to the magnet of the latter by the magnet of the former. The movements of the former are controlled by the human voice. It follows that the movements of the latter are also controlled by the same voice. It is the reversal of a process. If a disc is moved by the voice in a certain way, the moving of a disc in the same way by some other means will imitate the voice. So far as volume is concerned the imitation is microscopic. But it can be heard, and answers all purposes. It is doubtful if, among all the productions of human genius, there will ever be anything nearer the miraculous than the almost universally used telephone.

Telescopes.— This invention is noticed by Leonard Digges, about 1571. Roger Bacon, A. D. 1250, described telescopes and microscopes exactly, and yet neither was made till one Metius, at Alkmaar, and Jansen, of Middelburg, made them about the same time; the latter from an accidental discovery made by his children, 1590–1609. Galileo imitated their invention by its description, and made three in succession, one of which magnified a thousand times. With these he discovered Jupiter's moons, and the phases of Venus. Telescopes became very popular, and were improved by Zucchi, Huygens, Gregory, and Newton; and finally by Martin, Hall, Dolland, and Herschel. Achromatic telescopes were made by Hall about 1728. Many excellent and powerful telescopes have since been constructed.

Terms in Electricity.— The technical terms used in regard to electricity refer to units of various nature. Thus the unit of capacity is one farad; the unit of activity, one watt; the unit of work, one joule; the unit of quantity, one coulomb; the unit of current, one ampere; the unit of resistance, one ohm; the unit of magnetic field, one gauss; the unit of pressure, one volt; the unit of force, one dyne. The names are mostly derived from the names of men that have been famous in the field of electrical research. Thus Michael Faraday, James Watt, and James P. Joule, famous English discoverers, give their names to the first three units mentioned; Charles A. Coulomb and Andre M. Ampère, French inventors, to the two units following; G. S. Ohm and Carl F. Gauss, Germans, name two more units; and the volt is named from the Italian discoverer, Volta. The dyne is derived from the root word of dynamo, itself meaning force.

Thermometer, The.— The thermometer is an instrument for measuring the heat or temperature of bodies by the regular expansion of mercury or alcohol in a graduated glass tube. Halley proposed the substitution of mercury

for alcohol in 1697. The thermometers usually employed are Fahrenheit's, the Centigrade, and Reaumur's, the first invented in 1726, and the two others soon afterwards.

The following table is interesting as a comparison of the three thermometers:—

| | Reaumur. | Centigrade. | Fahrenheit. |
|-------------------------|----------|-------------|-------------|
| Freezing point..... | 0 | 0 | 32 |
| Vine cultivation..... | 8 | 10 | 50 |
| Cotton cultivation..... | 16 | 20 | 68 |
| Hatching eggs..... | 32 | 40 | 104 |
| | 40 | 50 | 122 |
| | 48 | 60 | 140 |
| | 56 | 70 | 158 |
| | 64 | 80 | 176 |
| | 72 | 90 | 194 |
| Water boils..... | 80 | 100 | 212 |

Ice melts at 32°; temperature of globe, 50°; blood heat, 98°; alcohol boils, 174°; water boils, 212°; lead melts, 594°; heat of common fire, 1,140°; brass melts, 2,233°; iron melts, 3,479°.

Thunder is caused by the sudden re-entrance of the air into a vacuum which is supposed to be caused by the lightning in its passage through the atmosphere. The electricity exerts a powerful repulsive force upon the particles of air along the path of its discharge, thus making a momentary vacuum. Into this void the surrounding air rushes with a violence proportioned to the intensity of the electricity, and is thus thrown into vibrations, which are the source of the sound.

Tides, The.— The ebb and flow of tidal waters depend upon the moon to a great extent. Twice every day we have the tides, twelve hours apart, and the flow and ebb are merely examples of the attraction of gravitation which is exercised on all bodies, whether liquid or solid. The tides may be compared to a great wave, which, raised by the moon's attraction, follows her in her course round the earth. The sun also aids in this effect, but as the moon is so much nearer the earth her influence is far greater. The tides are highest at the equator and lowest at the poles, because the tropics are more exposed to the lunar attraction.

Tobacco.— The name tobacco is thought by some to have been taken from Tobacco, a province of Yucatan; by others from Tobago, an island in the Caribbean Sea; and by still others from Tobasco, in the Gulf of Florida. The plant, although it is asserted that the Chinese have used it from earliest times, was not introduced into Europe until after the discovery of America by Columbus. He first found it in use on the Island of San Domingo in the West Indies. The Indian, among all the tribes from Peru to Upper Canada, smoked it in pipes. The seed of the plant was first introduced in Europe by Gonzalo Hernandez

de Oviedo, who took it to Spain and cultivated it for ornamental purposes; but its narcotic qualities were shortly afterward discovered and the practice of smoking it soon became general, and its manufacture into snuff followed in course of time. It was introduced in Italy and France in 1560, and was brought into the latter country by Jean Nicot, the French Ambassador to Portugal, in whose honor it received its botanical name *Nicotiana*, whence the name nicotine. The plant was introduced into England by Sir Walter Raleigh. It was along in the seventeenth century before it was known to be used in Asia, but the Oriental nations at the present time are probably the greatest smokers in the world.

Type-Setting Machines.—The first type-setting machine appears to have been invented by William Church of Connecticut about 1820. This, after the lapse of twenty years, was followed by a number of others, scarcely a year passing without one or more being made the subject of a patent. In 1857 a machine was invented by Robert Hattersley which is capable of setting from 4,000 to 6,000 types in an hour—about three men's work. This machine, which occupies a space of about two or three feet, has a horizontal stage on which is placed a partitioned tray, containing the rows of type running from back to front, each row being, of course, all the same letter. Descending vertically along the front of this tray is a series of as many wires with pistons as there are rows of types, and these pistons are depressed by the keys acting by bell cranks, and then return to their positions by means of India rubber bands or springs. A propeller kept in a state of tension by an India rubber string is placed in the rear of each row of types, and draws them forward to the piston. When the girl working the machine presses down, say, an *e* key, it depresses the *e* piston, which pulls down with it an *e* type, and drops it into a tube or channel, which conveys it to what represents the composing-stick, and so on with every letter, figure, comma, or space. Another successful machine is the Mitchell type-setter. The compositor has a key-board, each key of which strikes out a type from a brass slide placed on an incline. The type travels along an endless band to a spot where it is turned on end and pushed forward by a notched wheel. The apparatus comprises numerous bands, the lengths and velocities of which so vary as to enable the types at different distances from the wheel to reach it in the order in which the keys are struck. The words are built up in rows thirty inches long, and "justified," as is the case with the Hattersley machine, by hand.

Typewriters.—Perhaps the earliest form of a typewriter is a rude machine invented in England in 1714, without any practical fruits. M. Foucault sent to the Paris Exposition of 1855, a writing machine for the blind, but the first of what are now popularly known as typewriters, was patented in 1868 by C. L. Sholes, of Wisconsin. This has been improved, until now it is possible to attain a speed of seventy-five to eighty words a minute in writing with this machine, which is fast enough for reporting speeches. The principal advantages gained are rapidity of execution and legibility. A typewriter can write with both hands and several fingers in instant succession, every letter being made with a single light touch, instead of requiring from three to seven distinct strokes and dots, as in ordinary script.

Umbrellas are by no means a modern invention. They are found sculptured on the monuments of Egypt, and on the ruins of Nineveh, and their use in China and India is also very ancient. In Greece they had a part in certain religious ceremonies; and there is no doubt, from the paintings on ancient Greek vases, that umbrellas very much like those in use at the present time were known many years before the Christian era. They were also used among the Romans, but only by women. The umbrella also seems to have been a part of an insignia of royalty, as is still the case in parts of Asia and Africa. An English dictionary, published in 1708, defines an umbrella as "a screen commonly used by women to keep off rain." Jonas Hanway is said to have been the first man to have carried an umbrella through the streets of London in rainy weather, about 1750, and he was hooted and jeered at by boys for his fears of a wetting. It is not known, however, when their use began in England, as representations of such articles are found in very ancient manuscripts. Umbrellas were introduced in America in the latter part of the eighteenth century, but their use at first was confined almost exclusively to women, as it was considered very effeminate to carry one.

Undulatory Theory of Light.—For a long while there were two rival theories to account for the nature of light and optical phenomena, and it is only of late years that the observations and experiments of scientists have fully established the undulatory theory and disproved the corpuscular theory. The former maintains that light is a transference of energy to the eye; the latter, that it is a transference of matter. The undulatory theory assumes the entire universe and all matter to be pervaded with a highly elastic imponderable fluid, which is called ether. Light, then, consists in the

propagation of energy by a wave motion through this fluid—a process exactly analogous to the transmission of sound in air and of waves in water. This theory explains the nature of radiant heat also and its relation to light, considering it is an undulatory motion, in this same ether, of similar character but different degree. The now discarded corpuscular theory, which was supported by no less a man than Sir Isaac Newton, assumed that an infinite number of minute material particles emanated from a luminous body, and, impinging on the eye, gave the sensation of light. Huygens has the credit of having propounded, developed, and illustrated the undulatory theory. His propositions and conclusions were finally and fully substantiated by the successive experiments and demonstrations of Young, Fizeau, and Foucault. The velocity of light, or the rate at which this wave motion is communicated through the ether, is 186,000 miles a second.

Vaccination, as a preventive of smallpox, was discovered by Dr. Edward Jenner, an English physician. His attention was directed to the subject upon casually hearing that persons engaged in milking cows frequently had the cowpox, a mild disorder of the eruptive kind appearing on the udder of the animal, and communicated in a similar form to the hands, and that the belief was common among the agricultural classes that whoever had taken the disease was secure against the infection of smallpox. After frequent experiments he ascertained that only one form of the eruption on the cow's udder possessed this property, a number of these experiments being made upon his son, a boy six years old. He labored against opposition for many years before the value of his discovery was acknowledged by the medical profession. There are several places in the United States where a business is made of supplying the market with "vaccine points"—small quills, with a coating of the cow virus on the ends. The name is derived from *vacca*, meaning a cow.

Vacuum.—This word means, literally, empty space, or space wholly devoid of matter. In this sense, the results of modern scientific investigation tend to prove that a vacuum cannot exist, as all space is pervaded by the imponderable elastic fluid called ether, whose existence must be allowed to explain the transmission of light and heat from distant luminous bodies. (See Undulatory Theory of Light.) In common language, a vacuum (more or less perfect) is said to be produced when ordinary ponderable matter, as air, has been removed from the interior of a closed vessel. Until the beginning of the present

century the most perfect vacuum that could be obtained was what is called the Torricellian vacuum—i. e., the space above the mercury in a carefully filled barometer tube. Such a vacuum is, however, almost useless for experimental purposes; and, besides, it contains mercurial vapor. By modern scientific methods and appliances a vacuum may be obtained in which there is left less than 1-135,000 of the original volume of air. An ordinary air-pump in good working order will remove all but about 1-120 of the air in the receiver. The old phrase that "Nature abhors a vacuum," was used to account for various phenomena in the past—among them the rise of water in pumps. Most of these are now well understood, the simple natural laws governing them. Water, for instance, rises in a tube, when the air is exhausted above it, owing to the pressure of the atmosphere on the open surface of the liquid in which the end of the tube is immersed. This pressure or weight of the atmosphere is equal to the weight of a column of water about thirty-two feet high, and, accordingly, will raise the water to this height.

Velocity.—The average velocity of various bodies is here given:—

| | Per hour. | Per sec. |
|----------------------------|---------------------------|----------|
| A man walks..... | 3 miles, or | 4 feet. |
| A horse trots..... | 7 " or | 10 " |
| A horse runs..... | 30 " or | 29 " |
| Steamboats move..... | 18 " or | 26 " |
| Sailing vessels move..... | 10 " or | 14 " |
| Slow rivers flow..... | 3 " or | 4 " |
| Rapid rivers flow..... | 7 " or | 10 " |
| A moderate wind blows..... | 7 " or | 10 " |
| A storm moves..... | 36 " or | 52 " |
| A hurricane moves..... | 80 " or | 117 " |
| A rifle ball moves..... | 963 " or | 1,466 " |
| Sound moves..... | 743 " or | 1,142 " |
| Light moves..... | 192,000 miles per second. | |
| Electricity moves..... | 288,000 " " " | |

Violin.—The origin of the violin can be traced back to a stringed instrument called the ravanastron, invented, it is believed, in 5000 B. C., by Ravana, King of Ceylon. The crwth, which was in use in Wales long before the sixth century, and to which the Anglo-Saxons gave the name of fythel, whence our fiddle, was a similar instrument. The violin of modern form was not made until the fifteenth or sixteenth centuries, and its earliest maker was Gaspard di Salo, of Lombardy; and the Italian school of violin-making was probably founded by him at Brescia. These Brescian instruments—that is to say, those made by Giovanni Paolo Magini, still hold a place among the best ever made. It was not long, however, after the establishment of the Brescian school when the makers of Cremona began to produce instruments which have been objects of wonder and admiration from their time to the present. The three greatest Crem-

onese makers were Nicholas Amati, Joseph Guarneri del Gesu and Antonius Stradivarius. To those who at the present time willingly pay hundreds and even thousands of dollars for a violin made by one of these great makers, it may be of interest to know that they all were simple, hard-working artisans, who sold their works of genius for a few florins.

Volcanoes.—A volcano is a mountain, or opening in the earth's crust, through which issue fire, smoke, ashes, lava, steam, etc. Volcanoes may be distinguished as extinct and active. Extinct volcanoes are such as are now at rest, but were subject to eruptions in former ages, as is shown by their form and structure, and the presence of craters. Active volcanoes are such as are either in a constant state of eruption, or have eruptions from time to time, with intervals of rest.

Volcanoes throw out an enormous amount of material. Whole islands and portions of continents have been formed by volcanic action. Iceland is an example of a volcanic island.

The lava, when it first issues from a volcano, is somewhat like melted iron running from a furnace, but soon cools on the surface and forms a black, porous crust. Sometimes the streams are so thick that the interior remains hot for twenty years.

A terrific eruption of Mt. Vesuvius, A. D. 79, destroyed the flourishing cities of Pompeii, Herculaneum, and Stabiae, and covered them with ashes and cinders to the depth of fifteen feet.

About sixty eruptions of Mt. Etna are recorded. In 1669, a stream of lava from this mountain overflowed the ramparts of Catania, sixty feet in height, and destroyed a portion of the city. In 1832, several craters opened in the sides of the mountain, and a stream of lava eighteen miles long, one mile broad, and thirty feet deep, poured over the adjacent fields.

In 1835, the terrible eruption of Consequina occurred. It lasted three days, the sun being obscured over half of Central America, 40,000 square miles covered with dust, ashes, and lava.

In 1902 a violent eruption of Mt. Pelée took place, killing over 2,000 people.

Water Gas.—Much of the illuminating gas now used is made by the comparatively new process in which the main volume of the gas, consisting of hydrogen, is taken out of water. In the original coal gas process the illuminating agent is obtained directly from the distillation of soft or bituminous coal; and impurities being removed by washing it with water and then passing it through lime, the gas is ready for burning. The new process is, in outline, as follows: Steam is passed

through retorts filled with anthracite coal raised to a white heat by an air blast. In its passage it is decomposed, and the gas issuing from the pipes at the top consists of a mixture of hydrogen and carbon dioxide. This serves as the carrier for the true illuminating agents, which are a comparatively small percentage of the entire volume, and these are combined by mingling with naphtha vapor. This mixture has now about the same composition as the ordinary coal gas, but must be fixed—that is, made a stable compound—by subjecting it to the effect of heat and cold. This is accomplished by conducting it through two series of pipes, surrounded in one case by cold, running water, and in the other by steam. It is then purified in the same way as mentioned above. By passing it through a water tower loosely filled with something, as charcoal, down through which water trickles as the gaseous mixture ascends, the ammonia is dissolved out; then, by passing it through thin layers of lime, the other main impurity, sulphureted hydrogen, is removed. It is then ready for distribution through the city. Its illuminating power is about the same as, or somewhat greater than, that of coal gas. The water process produces the gas at a much lower cost; but in the other process there are a number of by-products derived from the distillation of the coal—*e. g.*, coke, coal tar, and also aqua ammonia, which is present in greater quantities in the coal gas—which are sold, and thus make the entire cost of manufacture about the same in each case.

Weaving.—The art of weaving appears to have been practiced in China from the earliest antiquity—more than a thousand years before it was known in Europe or Asia. Poets assign the art to the spider. Women originally spun, wove, and dyed; and the origin of these arts is ascribed, by ancient nations, to different women as women's art. The Egyptians ascribed the art to Isis, the Greeks to Minerva, and the Peruvians to the wife of Manco Capac. In most Eastern countries, the employment of weaving is still performed by the women. The Saviour's vest, or coat, had not any seam, being woven from the top throughout, in one whole piece. In 1831, two weavers from Brabant settled at York, England, where they manufactured woolen. Flemish dyers, cloth drapers, linen makers, silk throwsters, etc., settled at Canterbury, Norwich, Colchester, Southampton, and other places, on account of the Duke of Alva's persecution, 1567, and carried on the occupation of weaving.

Whisky.—The process of distilling liquors from grain is thought to have been first

discovered in India, and introduced into Europe by the Moors about 1150. Its use in Ireland dates back to about the same time, but it was not introduced into England until the close of the century. When first made, whisky was used as a medicine; and directions for making usquebaugh, or aqua vitæ, are contained in the "Red Book of Ossory," a volume compiled in the fourteenth century, in which it is described as a panacea for all diseases. The name whisky was at first given by the Scotch Highlanders to the liquor which they distilled from barley only, and had not, until later times, its present more general application. Usquebaugh was a Celtic name for the liquor, from which the word whisky is no doubt derived.

Wire.—The invention of drawing wire is ascribed to Rodolph of Nuremberg, about 1410. Mills for this purpose were set up at Nuremberg in 1563. The first wire mill in England was erected at Mortlake in 1663. The astonishing ductility of gold, which is one of its distinguishing qualities, is no way more conspicuous than in gilt wire. A cylinder of forty-eight ounces of silver, covered with a coat of gold weighing only one ounce, is usually drawn into a wire, two yards of which weigh only one grain. Eight grains of gold, covering a cylinder of silver, are commonly drawn into a wire 13,000 feet long; yet so perfectly does it cover the silver that even a microscope does not discover any appearance of the silver underneath.

X or Röntgen Rays were discovered in 1895 by Prof. W. K. Röntgen of Würzburg, Germany, who gave them the name "X rays" because he was ignorant of their precise nature. The discovery was accidental, and was made by observing that a highly fluorescent substance with which he was experimenting gave out light whenever a neighboring Crookes tube was excited, though this tube was covered with an opaque cloth. The phenomena differed from cathode rays, and it was found that when the human hand was interposed between the tube and a photographic plate, the new rays caused a marked shadow picture of the skeleton to appear on the plate. X rays are a radiation proceeding from a glass tube which has been exhausted of all but a trace of its air, and through which a discharge of electricity is taking place. For effecting this discharge two metal conductors are fastened to the tube with their ends or poles projecting inside. When a discharge occurs between them a form of radiation known as cathode rays is generated from the negative pole. The surface upon which these cathode rays first strike becomes the source of the X rays. In modern appliances this surface consists of a square of plat-

inum inserted into the vacuum tube and attached to the positive pole so as to face the negative or cathode pole. X rays move in straight lines but are not regularly reflected or refracted as ordinary light is, since they pass through any object which does not absorb them. Strange to say, they are largely absorbed by glass but pass through such substances as wood, cloth, and human flesh; and since the rays affect a sensitized plate photographs of the bones of the body, articles embedded in wood, etc., may be obtained. Certain substances opaque to the rays, i. e., having the power of absorbing them, while under their radiation, send out other rays so that these substances become secondary sources of X rays. This fact is of great importance in surgery. If the rays fall on any body which has been either positively or negatively charged with electricity the object discharges its electricity. Professor Thomson has shown that the explanation of this is not to be found in any direct effect which the rays have on the object itself, but in the fact that they render the surrounding atmosphere a conductor for electricity.

Besides their great value for locating foreign bodies, examining fractures, and detecting adulterations, the rays are extremely beneficial in treating certain classes of cancer and a limited number of skin diseases, such as lupus, eczema, syphilis, fluvus and acne.

Zodiac. The, is the name given by the ancients to an imaginary band extending around the celestial sphere, having as its medial line the ecliptic or apparent path of the sun. The signs of the Zodiac embrace the twelve important constellations which, owing to the motions of the earth, appear to revolve through the heavens within a belt extending nine degrees on each side of the sun's apparent annual path, and within or near which all the planets revolve. Since the sun appears successively in each of these constellations during the year, the zodiac was divided into twelve equal parts, corresponding to the months. These signs and their subdivisions were used in measuring time, and as a basis of astronomical and astrological calculations and predictions. Astronomers now, for convenience, use these signs, giving to each constellation an extent of thirty degrees, although the constellations vary in size. These signs are Aries, representing the ram; Taurus, the bull; Gemini, the twins; Cancer, the crab; Leo, the lion; Virgo, the virgin; Libra, the balance; Scorpio, the scorpion; Sagittarius, the archer; Capricornus, the goat; Aquarius, the water-bearer, and Pisces, the fishes. On the 20th of March the sun enters Aries, and at midnight

Virgo, the opposite constellation, will be overhead. During the month of April the sun will pass into Taurus, and at midnight Libra will be overhead. The early astronomers were astrologers, and claimed to be able to predict the future careers of individuals and nations by observing the positions and movements of the planets and the condition of the weather at the most important periods of men's lives. A man born when the sun was in the constellation Scorpio was believed to be naturally bent toward excessive indulgence of the animal passions; one born when the sun was in Aries was destined to be a great scholar or ruler; one born when the sun was in Pisces was predestined to grovel or be a servant, and so on. The porticoes of the temples of Denderah and Esne, in Egypt, have representations of the zodiacal constellations which are of great antiquity and have formed a fruitful theme of discussion; but the truth seems to be that nothing is as yet known respecting these ancient representations, for the manner in which the investigations have been mixed up with the Biblical question of the antiquity of man has prevented any truly scientific research. The Greeks would seem to have borrowed their constellations from the Egyptians and Babylonians, and this is corroborated to some extent by occasional remarks of Greek writers as to the positions of various constellations at certain times, which positions are inconsistent with the supposition of the observer being in Greece. The zodiacal figures of the Hindus, ancient Persians, Chinese, and Japanese have such a remarkable resemblance to those of the Egyptians that there can be little doubt as to their common origin.

Zöology is that science which treats of animals, their structure, habits, and classification.

There are four principal divisions of animals, based on distinct types of structure, and including all the denizens of the earth, the water, and the air. Following are the divisions of the animal kingdom, beginning with the lowest:—

SUB-KINGDOMS OR DIVISIONS.

I. **PROTOZOA**—First-living things, or lowest form of animal life.

II. **RADIATA**—Radiates that is, such as are shaped like a star or flower, and have their organs arranged uniformly around a common center.

CLASSES OF SUB-DIVISIONS.

1. Amœba, sponges, protel, etc. They have no mouth, and no distinct members, but are capable of making many changes in their form.

1. Coral animals, sea-anemones, etc.
2. Jelly-fishes, sea-nettles.
3. Star-fishes, sea-urchins.

SUB-KINGDOMS OR DIVISIONS.

III. **MOLLUSCA**—Mollusks, that is, soft-bodied, without joints, and without vertebrae, but usually protected by a shell.

IV. **ARTICULATA**—Articulates, that is, animals having the body and members jointed, but without an internal skeleton.

V. **VERTEBRATA**—Vertebrates, that is, animals that have a backbone, and an articulated or jointed skeleton, and a great nervous cord, the spinal marrow, inclosed in a bony sheath.

CLASSES OF SUB-DIVISIONS.

1. Bryozoa, that is, moss animals; as sea-mats, white sea-weeds, etc.
2. Brachlopoda, that is, with arm-feet, or spiral appendages; as the lingulae, spirifers, etc.
3. Ascidiæ, that is, pouch-like; as salpæ, etc.
4. Acephals, that is, headless; as oysters, etc.
5. Cephalates, that is, with heads; as snails, etc.
6. Cephalopoda, that is, with heads and feet, or, more strictly, tentacles.

1. Worms, as earthworms, leeches, etc.
2. Crustaceans, as crabs, lobsters, etc.
3. Centipedes, etc.
4. Spiders, etc.
5. Beeties, butterflies, etc.

1. Fishes.
2. Reptiles, that is, creeping things, as turtles, frogs, snakes, lizards, etc.
3. Birds, that is, "every winged fowl."
4. Mammalia, that is, animals with teats.

The last class, Mammalia, is further subdivided into fourteen orders, of which the most distinctive, still ascending from the lower to the higher, are four, namely:—

1. Cetacea, that is, of the whale tribe.
2. Quadrumpe, that is, four-footed animals generally.
3. Quadrumana, that is, four-handed; as the gorilla, chimpanzee, ape, and monkey.
4. Bimana, that is, two-handed; of which the only representative is man.

Bicycle (from the Latin *bis*, twice, and the Greek, *kuklos*, a wheel).—A two-wheeled machine, much used of late years for the purpose of human locomotion. The first bicycle was introduced into England from France about the year 1815, and was known as the *hobby-horse*; it was propelled by the feet of the rider being pushed against the ground. The improved bicycle at present in use was also a French invention, but the principle has been greatly developed by British and American manufacturers. *Tricycles*, or three-wheeled machines, are also largely used.

Many thousands of these machines are now constructed in America and Europe annually. With the possible exception of skating, bicycling is the quickest means of locomotion that man possesses. A fair bicyclist can outstrip a horse in a day, whilst an expert can do so in an hour.

Aerial Navigation or Aeronautics is the art of navigating the air. Within the past few years, and ever since the beginning of the twentieth century, air navigation has made notable progress toward practical results. Santos Dumont and others have shown that the flight of their machines can be directed even against contrary currents of air, and this is a most important advance. It still remains, however, for a dirigible machine to make long flights, and to be able to carry loads that would prove it commercially useful. The feat of flying has often been attempted; even among the ancients it was tried, and, we are informed, succeeded to some slight extent.

The most notable modern experiments with a view to attaining this end have been conducted by Hiram Maxim, of England, and Prof. Samuel P. Langley, of Washington, D. C.; the former constructing his machine on the plane system, and the latter designing his somewhat in the form of a fish. The flying machine proper is heavier than air, depending on the motions of mechanically propelled wings for its support. But the more usual and hitherto most successful type is the manageable balloon. In such a one Santos Dumont, in September, 1901, succeeded in winning the prize of \$20,000 offered to the aeronaut who should first (under given conditions) circle the Eiffel tower, in Paris. An experiment with Professor Langley's machine at Washington, October, 1903, proved an utter failure.

Radium. A recently discovered element, obtained from pitch-blende. It was first discovered by M. and Mme. Curie in 1898. Its temperature is 1.5° C. above that of its surroundings and according to Curie it emits heat radiations without combustion or chemical change, and without any apparent decrease in its energy. Its atomic weight is 225. The photographic action of its light is similar to that of Röntgen rays. Its rays have power to color glass and porcelain and in certain cases produce ozone. If its rays are passed through a gas they render it a conductor of electricity. Their effect on the human body is very marked. They produce luminosity in the eye, and they have power in some instances to paralyze the nerve centers. It requires enormous quantities of pitch-blende and great labor to produce a minute quantity of radium. At present a piece of radium a seventieth part of a grain in weight costs two dollars.

Osteopathy.—A system of healing. In spite of the apparent etymology of the name, the system does not confine itself to the treatment of bone diseases, but claims to be a general system founded on the principle that "all bodily disorders are the result of mechanical

obstruction to the free circulation of vital fluids and forces." No medicine whatever is used and no surgery employed, except in cases where the latter is needed exclusively.

Antitoxin.—An antidote to diseases produced by bacteria, which is obtained by inoculating a horse or other animal with the specific poison of the disease, increasing the strength of the material until the horse gains immunity from the disease. The serum of the horse's blood is then employed to inoculate persons attacked with the disease experimented on. This treatment has hitherto been used principally in diphtheria, and with marked success.

The establishment of the principles and the introduction of this treatment are due especially to Behring of Germany and Roux of Paris. The underlying principle of the treatment is based on the fact that, if a susceptible animal is inoculated first with small and then with increasing doses of the toxin produced by the bacillus, the blood of the animal is found to contain a substance called antitoxin, which has the power of neutralizing or rendering harmless the toxin. In order to obtain large quantities of the healing serum a horse is generally selected for the process of immunization. By proper methods very powerful antitoxins can be obtained. Dr. William H. Welch, of the Johns Hopkins University, in 1895, in an analysis of over 7,000 cases of diphtheria treated by antitoxin found that the fatality was reduced by this treatment by over 50 per cent of the previous death-rates; he concluded that the antitoxin serum is a specific curative agent for diphtheria, surpassing in its efficacy all other known methods of treatment for this disease. Since his report, this conclusion has been confirmed and even more favorable results have been obtained.

Phrenology (from the Greek *phrēn*, mind, and *logos*, a discourse).—The name given to a science which professes to found a philosophy of the mind upon the physiology of the brain, and upon the form of the brain and the comparative size of its parts as indicated by the shape of the skull. The first propounder of the science was Franz Joseph Gall, who was afterwards joined by Johann Gaspar Spurzheim. In 1810-12 they published jointly in Paris a work entitled *The Anatomy and Physiology of the Nervous System, and of the Brain in Particular*, in which the principles of the science were unfolded. The first English treatise on the subject was that of George Combe. That there is some connection between the brain and the mind is indisputable, and many of the theories of Gall and Spurzheim seem to be sustained to some extent by observation.

***Domestic Economy, Hygiene,
Dietetics.***

Domestic Economy, Hygiene, Dietetics.

AIR.

The common air is a fluid composed mainly of two gases, in certain proportions; namely, oxygen as twenty and nitrogen as eighty parts in a hundred, with a very minute addition of carbonic acid gas. Such is air in its pure and right state, and such is the state in which we require it for respiration. When it is loaded with any admixture of a different kind, or its natural proportions are in any way deranged, it cannot be breathed without producing injurious results. We also require what is apt to appear a large quantity of this element of healthy existence. The lungs of a healthy full-grown man will inhale the bulk of twenty cubic inches at every inspiration, and he will use no less than fifty-seven hogsheads in twenty-four hours.

Now, there are various circumstances which tend to surround us at times with vitiated air, and which must accordingly be guarded against. That first calling for attention is the miasma or noxious quality imparted to the air in certain districts by stagnant water and decaying vegetable matter. It is now generally acknowledged that this noxious quality is in reality a subtle poison, which acts on the human system through the medium of the lungs, producing fevers and other epidemics.

Putrid matter of all kinds is another conspicuous source of noxious effluvia. The filth collected in ill-regulated towns, ill-managed drains, collections of decaying animal substances placed too near or within private dwellings, are notable for their effects in vitiating the atmosphere, and generating disease in those exposed to them. In this case, also, it is a poison diffused abroad through the air which acts so injuriously on the human frame.

The human subject tends to vitiate the atmosphere for itself, by the effect which it produces on the air which it breathes. Our breath, when we draw it in, consists of the ingredients formerly mentioned; but it is in a very different state when we part with it. On passing into our lungs the oxygen, forming the lesser ingredient, enters into combination with the carbon of the venous blood (or blood which has already performed its round through the body); in this process about two fifths of the oxygen is abstracted and sent into the blood, only the remaining three fifths being expired, along with the nitrogen nearly as it was before. In place of the oxygen consumed, there is expired an equal volume of carbonic acid gas, such gas being a result of the process of com-

bination just alluded to. Now, carbonic acid gas, in a larger proportion than that in which it is found in the atmosphere, is noxious. The volume of it expired by the lungs, if free to mingle with the air at large, will do no harm; but, if breathed out into a close room, it will render the air unfit for being again breathed. Suppose an individual to be shut up in an air-tight box: each breath he emits throws a certain quantity of carbonic acid gas into the air filling the box; the air is thus vitiated, and every successive inspiration is composed of worse and worse materials, till at length the oxygen is so much exhausted that it is insufficient for the support of life. He would then be sensible of a great difficulty in breathing, and in a little time longer he would die.

Most rooms in which human beings live are not strictly close. The chimney and the chinks of the doors and windows generally allow of a communication to a certain extent with the outer air, so that it rarely happens that great immediate inconvenience is experienced in ordinary apartments from want of fresh air. But it is at the same time quite certain that, in all ordinary apartments where human beings are assembled, the air unavoidably becomes considerably vitiated, for in such a situation there cannot be a sufficiently ready or copious supply of oxygen to make up for that which has been consumed, and the carbonic acid gas will be constantly accumulating. This is particularly the case in bedrooms, and in theaters, churches, and schools.

Perhaps it is in bedrooms that most harm is done. These are generally smaller than other rooms, and they are usually kept closed during the whole night. The result of sleeping in such a room is very injurious. A common fire, from the draught which it produces, is very serviceable in ventilating rooms, but it is at best a defective means of doing so. The draught which it creates generally sweeps along near the floor between the door and the fire, leaving all above the level of the chimney-piece unpurified. Yet scarcely any other arrangement is anywhere made for the purpose of changing the air in ordinary rooms.

FOOD.

A food is a substance which, when introduced into the body, supplies material which renews some structure or maintains some vital process; and it is distinguished from a medicine in that the latter modifies some vital action, but does not supply the material which

sustains such action. It is essential to the idea of a food that it support or increase vital actions; whilst medicines usually may lessen, increase, or otherwise modify some of them. "Foods are derived," says Dr. Edward Smith, "from all the great divisions of nature and natural products, as earth, water, and air, solids, liquids, and gases; and from substances which are living and organic, or inanimate and inorganic. The popular notion of food as a solid substance derived from animals and vegetables, whilst comprehensive is too exclusive, since the water which we drink, the air which we breathe, and certain minerals found in the substance of the earth, are, adopting the definition given, of no less importance as foods. It is, however, of great interest to note how frequently all these are combined in one food, and how closely united are substances which seem to be widely separated. Thus water and minerals are found in both flesh and vegetables, whilst one or both of the components parts of the air, viz., oxygen and nitrogen, are distributed through every kind of food which is alone capable of sustaining life. Hence, not only may we add food to food to supply the waste of the body, but we may within certain limits substitute one for another as our appetites or wants demand. . . . Further, there seems to be an indissoluble bond existing between all the sources of food. There are the same classes of elements in flesh as in flour, and the same in animals as in vegetables.

"The vegetable draws water and minerals from the soil, whilst it absorbs and incorporates the air in its own growth, and is then eaten to sustain the life of animals, so that animals gain the substances which vegetables first acquired. But in completing the circle the vegetable receives from the animal the air (carbonic acid) which was thrown out in respiration, and lives and grows upon it; and at length the animal itself in whole or in part, and the refuse which it daily throws off, become the food of the vegetable. Even the very bones of an animal are by the aid of nature or man made to increase the growth of vegetables and really to enter into their structure; and being again eaten, animals may be said to eat their own bones, and live on their own flesh." It will be seen from this that animal and vegetable foods contain precisely the same elements though in different combinations. At the same time they differ sufficiently to make a due proportion of each necessary to perfect nutrition. One sterling point of difference is, that nitrogen constitutes a much larger percentage of animal bodies than of vegetables. Nitrogen is one of the most important elements of food; only such substances as con-

tain it can efficiently produce flesh or repair wasted tissue. So important is this distinction, in fact, that one of the divisions of food most generally recognized by physiologists is into nitrogenous and non-nitrogenous, or, as Liebig termed them, the flesh-forming and the heat-producing. Both kinds are essential to the maintenance of life, and it is because vegetables as a whole are deficient in nitrogen that the highest degree of bodily vigor cannot be kept up by them alone.

It is understood that the structures of the body are in a state of continual change, so that atoms which are present at one hour may be gone the next, and when gone the structures will be so far wasted, unless the process of waste be accompanied by renewal. But the renewing substance must be of the same nature as that wasted, so that bone shall be renewed by the constituent elements of bone, and flesh by those of flesh. This is the duty assigned to food,—to supply to each part of the body the very same kind of material that it lost by waste. As foods must have the same composition as the body, or supply some such other materials as can be transformed into the substances of the body, it is desirable to gain a general idea of what these substances are. The following is a summary of the principal materials of which the body is composed:—

Flesh, in its fresh state, contains water, fat, fibrin, albumen, besides compounds of lime, phosphorus, soda, potash, magnesia, silica, and iron, and certain extractives, whose nature is unknown. Blood has a composition similar in elements to that of flesh.

Bone is composed of cartilage, fat, and salts of lime, magnesia, soda, and potash, combined with phosphoric and other acids.

Cartilage consists of chondrin, from which gelatine is formed, with salts of soda, potash, lime, phosphorus, magnesia, sulphur, and iron.

The brain is composed of water, albumen, fat (so-called), phosphoric acid, osmazome, and salts.

The liver consists of water, fat, and albumen, with phosphoric and other acids, in conjunction with soda, lime, potash, and iron.

The lungs are formed of a substance called connective tissue, from which gelatine is formed by prolonged boiling, albumen, a substance analogous to casein, various fatty and organic acids, with salts of soda and iron, and water.

Bile consists of water, fat, resin, sugar, fatty and organic acids, cholesterin, and salts of potash, soda, and iron.

Hence, it is requisite that the body should be provided with salts of potash, soda, lime, magnesia, sulphur, iron, and manganese, as

well as sulphuric, hydrochloric, phosphoric, and fluoric acids and water; also, nearly all the fat which it consumes daily, and probably all the nitrogenous substances which it requires and which are closely allied in composition, as albumen, fibrin, etc. "So great an array of mysterious substances," says Dr. Smith, "might well prevent us from feeding ourselves or others if the selection of food depended solely upon our knowledge or judgment; but it is not so, for, independently of the aid derived from our appetites, there is the great advantage of having foods which contain a proportion of nearly all these elements; and combinations of foods have been effected by experience which protect even the most ignorant from evil consequences. Thus flesh, or the muscular tissue of animals, contains precisely the elements which are required in our flesh-formers, and, only limited by quantity, our heat-generators also; and life may be maintained for very lengthy periods upon animal food and water. Seeing, moreover, that the source of flesh in animals which are used as food, is of vegetable origin, it follows that vegetables should contain the same elements as flesh, and it is a fact of great interest that in vegetables we have food elements closely analogous to those contained in the flesh of animals. Thus, in addition to water and salts, common to both, there is vegetable chondrin, vegetable albumen, vegetable fibrin, and vegetable casein, all having a composition almost identical with animal albumen, fibrin, chondrin and casein." The articles containing most of the three articles needed generally in the body are as follows: for fat and heat-making—butter, lard, sugar and molasses; for flesh or muscle-forming—lean meat, cheese, peas, beans, and lean fishes; for brain and nerves—shell fish, lean meats, pease, beans, and very active birds and fishes, who live chiefly on food in which phosphorus abounds. In a meat diet, the fat supplies the carbon for keeping up the heat of the body, and the lean furnishes nutriment for the muscles, brain, and nerves. Green vegetables, fruits, and berries furnish additional supplies of the acids, the salts, and water needed.

Kinds of Food.—The simplest and most powerful agent in determining the character of our food is climate. In cold countries the requirements of man are very different from those felt in the tropics, and from the Esquimaux, who, according to Dr. Kane, will drink ten or twelve gallons of train oil in a day, to the Peruvians and other tropical nations for whom the banana suffices for nearly all seasons of the year, there are various gradations in which the constituents of the diet bear a very

direct relation to the prevailing temperature. In cold regions man requires such food as not only supplies him with nutriment, but also with heat; as oil, butter, fat, sugar, and other substances in which carbonaceous elements predominate. In warm countries, on the contrary, it is one of the most essential conditions of good health, that his food should be as little heating as possible. In our own climate this law holds good as between summer and winter; in the latter season, plenty of lean meat, butter, potatoes, eggs, sugar, and similar food are necessary to keep the animal machine in working order, while in summer the diet should consist chiefly of those substances of which nitrogenous or flesh-forming elements compose the largest part. There is probably no other cause so fruitful in producing the dyspepsia and similar diseases of which Americans, as a nation, are in a peculiar degree the victims as the neglect to harmonize the food with the changing seasons.

The next most important question in determining the character of our food is that of its digestibility; and it must be borne in mind that the nutritive value and the digestibility of food have no necessary relation to each other. A food may have a very high nutritive value and yet be so indigestible as to be practically useless, and on the other hand it may be very easily digested and worth little or nothing for nutrition. No general rules as to the digestibility of different foods can be laid down, because it depends very largely upon individual habits and conditions. Persons who have a strong constitution, and take sufficient exercise, may eat almost anything with apparent impunity; but young children who are forming their constitutions, and persons who are delicate, and who take but little exercise, are very dependent for health upon a proper selection of food. As a general thing, when the body requires a given kind of diet, specially demanded by brain, lungs, or muscles, the appetite will crave that food until the necessary amount is secured. If the food in which the needed aliment abounds be not supplied, other food will be taken in larger quantities than needed until that amount is gained; for all kinds of food have supplies for every part of the body, though in different proportions. Thus, for example, if the muscles are worked a great deal, food in which nitrogen abounds is required, and the appetite will remain unappeased until the requisite amount of nitrogen is secured. Should food be taken which has not the requisite quantity, the consequence will be that the vital powers will be needlessly taxed to throw off the excess. There are other kinds of food which are not only nourishing

but stimulating, so that they quicken the functions of the organs on which they operate; the condiments used in cookery, such as pepper, mustard, and spices, are of this nature. There are certain states of the system in which these stimulants may be beneficial and even necessary; but persons in perfect health, and especially young children, never receive any benefit from such food, and just in proportion as condiments operate to quicken the action of the internal organs, they tend to wear down their powers. The same observation applies to the use of wines and other spirituous and malt liquors. Under certain conditions where the vital powers are low, they are a highly important addition to ordinary food; but when used habitually, their temporary stimulation is gained at the expense of permanently weakening the digestive organs which finally refuse to perform their work without some such external aid. It follows from the above that the requirements of food in each case may in a normal condition of things be left to the individual taste, to be selected and prepared as is indicated by experience to be most appropriate.

Nutritiousness of Food.—The following table from authentic sources shows the ascertained percentage of nutriment in the common articles of table consumption:—

| KIND OF FOOD. | Preparation. | Percent. of Nutriment. | Time of Digestion. | |
|----------------------|--------------|------------------------|--------------------|----|
| | | | H. | M. |
| Almonds..... | raw | 66 | — | — |
| Apples..... | raw | 10 | 1 | 30 |
| Apricots..... | raw | 26 | — | — |
| Barley..... | boiled | 92 | 2 | 00 |
| Beans, dry..... | boiled | 87 | 2 | 30 |
| Beef..... | roast | 26 | 3 | 30 |
| Blood..... | — | 22 | — | — |
| Bread..... | baked | 80 | 3 | 30 |
| Cabbage..... | boiled | 7 | 4 | 30 |
| Carrots..... | boiled | 10 | 3 | 15 |
| Cherries..... | raw | 25 | 2 | 00 |
| Chickens..... | fricasseed | 27 | 2 | 45 |
| Codfish..... | boiled | 21 | 2 | 00 |
| Cucumbers..... | raw | 2 | — | — |
| Eggs..... | whipped | 13 | 1 | 30 |
| Flour, bolted..... | in bread | 21 | — | — |
| Flour, unbolted..... | in bread | 35 | — | — |
| Gooseberries..... | raw | 19 | 2 | 00 |
| Grapes..... | raw | 27 | 2 | 30 |
| Haddock..... | boiled | 18 | 2 | 30 |
| Melons..... | raw | 3 | 2 | 00 |
| Milk..... | raw | 7 | 2 | 15 |
| Mutton..... | roast | 30 | 3 | 15 |
| Oatmeal..... | baked | 74 | 3 | 30 |
| Oils..... | raw | 96 | 3 | 30 |
| Pease, dry..... | boiled | 93 | 2 | 30 |
| Peaches..... | raw | 20 | 2 | 00 |
| Pears..... | raw | 10 | 3 | 30 |
| Plums..... | raw | 29 | 2 | 30 |
| Pork..... | roast | 21 | 5 | 15 |
| Potatoes..... | boiled | 13 | 2 | 30 |
| Rice..... | boiled | 88 | 1 | 00 |
| Rye flour..... | baked | 79 | 3 | 30 |
| Sole..... | fried | 21 | 3 | 00 |
| Soup, barley..... | boiled | 20 | 1 | 30 |
| Strawberries..... | raw | 12 | 2 | 00 |
| Turnips..... | boiled | 4 | 3 | 30 |
| Veal..... | fried | 25 | 4 | 30 |
| Venison..... | broiled | 22 | 1 | 30 |
| Wheat bread..... | baked | 95 | 3 | 30 |

Digestibility of Food.—In Order of Time. The following table of the digestibility of the most common articles of food, prepared from standard authorities, is approximately correct, and is of very general practical interest:—

| QUALITY. | Preparation. | Time of Digestion. | |
|--------------------------------|--------------|--------------------|----|
| | | H. | M. |
| Cole slaw..... | — | 1 | 00 |
| Rice..... | boiled | 1 | 00 |
| Pig's feet, soured..... | boiled | 1 | 00 |
| Tripe, soured..... | boiled | 1 | 00 |
| Eggs, whipped..... | raw | 1 | 30 |
| Trout, salmon, fresh..... | boiled | 1 | 30 |
| Trout, salmon, fresh..... | fried | 1 | 30 |
| Soup, barley..... | boiled | 1 | 30 |
| Apples, sweet, mellow..... | raw | 1 | 30 |
| Venison steak..... | broiled | 1 | 35 |
| Brains, animal..... | boiled | 1 | 45 |
| Sago..... | boiled | 2 | 00 |
| Tapioca..... | boiled | 2 | 00 |
| Barley..... | boiled | 2 | 00 |
| Milk..... | boiled | 2 | 00 |
| Liver, beef's, fresh..... | raw | 2 | 00 |
| Eggs, fresh..... | boiled | 2 | 00 |
| Codfish, cured, dry..... | raw | 2 | 00 |
| Apples, sour, mellow..... | raw | 2 | 00 |
| Cabbage, with vinegar..... | raw | 2 | 15 |
| Milk..... | roasted | 2 | 15 |
| Eggs, fresh..... | roasted | 2 | 18 |
| Turkey, wild..... | boiled | 2 | 25 |
| Turkey, domestic..... | boiled | 2 | 25 |
| Gelatine..... | roasted | 2 | 30 |
| Turkey, domestic..... | roasted | 2 | 30 |
| Goose, wild..... | roasted | 2 | 30 |
| Pig, sucking..... | roasted | 2 | 30 |
| Lamb, fresh..... | broiled | 2 | 30 |
| Hash, meat and vegetables..... | warmed | 2 | 30 |
| Beans, pod..... | boiled | 2 | 30 |
| Cake, sponge..... | baked | 2 | 30 |
| Pumpkins..... | boiled | 2 | 30 |
| Potatoes, Irish..... | roasted | 2 | 30 |
| Cabbage, head..... | raw | 2 | 30 |
| Spinal marrow, animal..... | boiled | 2 | 40 |
| Chicken, full grown..... | fricasseed | 2 | 45 |
| Custard..... | baked | 2 | 45 |
| Beef, with salt only..... | boiled | 2 | 45 |
| Apples, sour, hard..... | raw | 2 | 50 |
| Oysters, fresh..... | raw | 2 | 55 |
| Eggs, fresh..... | soft boiled | 3 | 00 |
| Base, striped, fresh..... | broiled | 3 | 00 |
| Beef, fresh, lean, rare..... | roasted | 3 | 00 |
| Pork, recently salted..... | stewed | 3 | 00 |
| Mutton, fresh..... | broiled | 3 | 00 |
| Soup..... | boiled | 3 | 00 |
| Chicken soup..... | boiled | 3 | 00 |
| Aponeurosis..... | boiled | 3 | 00 |
| Dumpling, apple..... | boiled | 3 | 00 |

Quantity of Food.—With regard to the quantity of food to be taken, this also depends upon individual conditions and cannot be formed into a general rule. Where hunger is felt it may safely be assumed that when the hunger has been fully appeased sufficient food has entered the stomach. Such are the circumstances of civilized life, however, that in most cases hunger is a very rare sensation; and food is prepared and eaten more to gratify the palate than because nature demands it. On this point each individual is and must be a law unto himself, and we can only point out the consequences of eating a larger quantity than is needed. When too great a supply of food is put into the stomach, the gastric juice only dissolves that portion of it which the wants of the system demand; most of the remainder is ejected in an unprepared state,

the absorbents take portions of it into the circulatory system, and all the various bodily functions dependent on the blood are thus gradually and imperceptibly injured. Very often, indeed, intemperance in eating produces immediate results, such as colic, headache, indigestion, and vertigo; but the more common result is the gradual undermining of all parts of the human frame, shortening life by thus weakening the constitution.

As to the hours of meals these are of no importance provided they are regular and come at regular intervals. This interval should never be less than five hours, as the stomach requires at least three hours to digest its supply of food, and not less than two hours should be allowed it for rest and recuperation.

Eating between meals is a most injurious practice, the source in children, especially, of endless stomachic disorders. It may be well to give children under ten years of age one more meal during the day than the three which adults in this country usually allow themselves; but these, as we have said above, should be at regular times and with stated intervals between them.

After taking a full meal, it is very important to health that no great bodily or mental exertion be made till the labor of digestion is over. Muscular exertion draws the blood to the muscles, and brain work draws it to the head; and in consequence of this the stomach loses the supply which is necessary to it when performing its office, the adequate supply of gastric juice is not afforded, and indigestion is the result. The heaviness which is felt after a full meal is a sure indication of the need of quiet; when the meal is moderate, the process of digestion will be sufficiently advanced in an hour, or an hour and a half, to justify the resumption of bodily or mental labor.

The Diet of Brain Workers.—It has long been one of the pet theories of popular physiology, that fish and other substances composed largely of phosphorus, are the most appropriate diet for brain workers; but it is now conceded that the best food for the brain is that which best nourishes the whole body with special reference to the nervous system, viz.: fat and lean meat, eggs, milk, and the cereals. Discussing this point in a recent treatise, Dr. George M. Beard says: "The diet of brain workers should be of a large variety, delicately served, abundantly nutritious, of which fresh meat, lean and fat, should be a prominent constituent. In vacations, or whenever it is desired to rest the brain, fish may, to a certain extent, take the place of meat. We should select those articles that are most agreeable to

our individual tastes, and, so far as possible, we should take our meals amid pleasant social surroundings. In great crises that call for unusual exertion, we should rest the stomach, that for the time the brain may work the harder; but the deficiency of nutrition ought always to be supplied in the first interval of repose."

CHEMICAL COMPOSITION OF THE HUMAN BODY.

The human body is composed of the following elements, all of which are found also in the food provided by nature, or in air or water, and all must be supplied, day by day, or some bad results are sure to follow:—

| | LB. | OZ. | GR. |
|---|-----|-----|-----|
| Oxygen, a gas, in quantity sufficient to occupy a space equal to 750 cubic feet,..... | 111 | 0 | 0 |
| Hydrogen, a gas, in quantity sufficient to occupy 3000 feet, which with oxygen, constitutes water, the weight of the two indicating nearly the necessary amount of water..... | 14 | 0 | 0 |
| Carbon, constituting fat, and used also for fuel to create animal heat..... | 21 | 0 | 0 |
| Nitrogen, which constitutes the basis of the muscles, and solid tissues, and which is supplied by that part of the food which we shall denominate Nitrates..... | 3 | 8 | 0 |
| Phosphorus, the physical source of vitality, and the most important of the mineral elements, will represent the whole class which we shall denominate the Phosphates..... | 1 | 12 | 190 |
| Calcium, the metallic base of lime, which is the base of the bones..... | 2 | 0 | 0 |
| Fluorine, found combined in small quantities in bones..... | 0 | 2 | 0 |
| Chlorine, constituting, with sodium, common salt, found in the blood..... | 0 | 2 | 47 |
| Sodium, the base of all the salts of soda..... | 0 | 2 | 116 |
| Iron, which is supposed to give color to the blood..... | 0 | 0 | 100 |
| Potassium, the base of all the salts of potash..... | 0 | 0 | 290 |
| Magnesium, the base of magnesia, and magnesian salts..... | 0 | 0 | 12 |
| Silicon, the base of silex, which is found in the hair, teeth, and nails..... | 0 | 0 | 2 |

The elements of a man weighing 154 lbs.

Classification of Food.— Food may be divided into three classes. That class which supplies the lungs with fuel, and thus furnishes heat to the system, and supplies fat or adipose substance, etc., we shall call Carbonates, carbon being the principal element; that which supplies the waste of muscles, we shall call Nitrates, nitrogen being the principal element; and that which supplies the bones, and the brain, and the nerves, and gives vital power, both muscular and mental, we shall call the Phosphates, phosphorus being the principal element. These last might be subdivided into the fixed and the soluble phosphates,—the fixed being a combination principally with lime to form the bones, and the soluble being combinations with potash and soda, to work

the brain and nerves; but our analyses as yet are too imperfect to allow a subdivision, and as all the mineral elements are more or less combined with each other, and all reside together in articles of food, we shall include all mineral elements under the term Phosphates.

The waste, and consequently the supply, of these three classes of elements is very different, four times as much carbonaceous food being required as nitrogenous, and of the phosphates not more than two per cent. of the carbonates. Altogether, the waste of these principles will average in a man of moderate size, with moderate heat, more than one pound in a day, varying very much according to the amount of exercise and the temperature in which he lives. These elements must all be supplied in vegetable or animal food, not one being allowed to become a part of the system unless it has been first organized with other elements of food, in some vegetable, or in water, or the atmosphere; but being appropriated by some animal, remain organized and adapted to the human system, so that animal and vegetable food contain the same elements in the same proportion and nearly the same chemical combinations, and are equally adapted to supply all necessary elements.

| | | |
|--------------------|--|--|
| In Animal Food, | <div style="display: inline-block; vertical-align: middle;"> <div style="display: inline-block; vertical-align: middle;"> The Carbonates are furnished in </div> <div style="display: inline-block; vertical-align: middle; font-size: 2em;">}</div> <div style="display: inline-block; vertical-align: middle;"> Fat. </div> </div> | |
| | | <div style="display: inline-block; vertical-align: middle;"> The Nitrates in </div> <div style="display: inline-block; vertical-align: middle; font-size: 2em;">}</div> <div style="display: inline-block; vertical-align: middle;"> Albumen, Fibrin, and Casein. </div> |
| In Vegetable Food, | <div style="display: inline-block; vertical-align: middle;"> The Carbonates are furnished in </div> <div style="display: inline-block; vertical-align: middle; font-size: 2em;">}</div> <div style="display: inline-block; vertical-align: middle;"> Sugar, Starch, and a little Fat. </div> | |
| | | <div style="display: inline-block; vertical-align: middle;"> The Nitrates in </div> <div style="display: inline-block; vertical-align: middle; font-size: 2em;">}</div> <div style="display: inline-block; vertical-align: middle;"> Gluten, Albumen, and Casein. </div> |

The Phosphates in both animal and vegetable food are found inseparably connected with the nitrates, none being found in any of the carbonates, and generally in the proportion of from two to three per cent. of all the principles in vegetable, and from three to five in animal food.

The Carbonates of both animal and vegetable food are chemically alike—fat, sugar, and starch, all being composed of carbon, oxygen, and hydrogen, and in about the same chemical combinations and proportions.

The Nitrates, also albumen, gluten, fibrin, and casein, are alike in chemical combinations and elements, being composed of nitrogen, oxygen, and hydrogen, and a little carbon not digestible. These simple bodies are not, however, capable of being assimilated and converted into tissue; they must be previously combined, primarily by the vegetable kingdom.

CLEANLINESS.

To keep the body in a cleanly condition is the third important requisite for health. This becomes necessary in consequence of a very important process which is constantly going on near and upon the surface of the body.

The process in question is that of perspiration. The matter here concerned is a watery secretion produced by glands near the surface of the body, and sent up through the skin by channels imperceptibly minute and wonderfully numerous. From one to two pounds of this secretion is believed to exude through these channels, or pores, in the course of twenty-four hours, being, in fact, the chief form taken by what is called the waste of the system, the remainder passing off by the bowels, kidneys, and lungs. To promote the egress of this fluid is of great consequence to health; for, when it is suppressed, disease is apt to fall upon some of the other organs concerned in the discharge of waste.

One of the most notable checks which perspiration experiences is that produced by a current of cold air upon the skin, in which case the pores instantly contract and close, and the individual is seized with some ailment either in one or the other of the organs of waste whichever is in him the weakest, or in the internal lining of some part of the body, all of which is sympathetic with the condition of the skin. A result of the nature of that last described is usually recognized as a cold or catarrh. We are not at present called on particularly to notice such effects of checked perspiration, but others of a less immediately hurtful or dangerous nature.

The fluid alluded to is composed, besides water, of certain salts and animal matters, which, being solid, do not pass away in vapor, as does the watery part of the compound, but rest on the surface where they have been discharged. There, if not removed by some artificial means, they form a layer of hard stuff,

and unavoidably impede the egress of the current perspiration. By cleanliness is merely meant the taking proper means to prevent this or any other matter accumulating on the surface, to the production of certain hurtful consequences.

Ablution or washing is the best means of attaining this end; and accordingly it is well for us to wash or bathe the body very frequently. Many leave by far the greater part of their bodies unwashed, except, perhaps, on rare occasions, thinking it enough if the parts exposed to common view be in decent trim. If the object of cleaning were solely to preserve fair appearances, this might be sufficient; but the great end, it must be clearly seen, is to keep the skin in a fit state for its peculiar and very important functions. Frequent change of the clothing next to the skin is of course a great aid to cleanliness, and may partly be esteemed as a substitute for bathing, seeing that the clothes absorb much of the impurities, and, when changed, may be said to carry these off. But still this will not serve the end nearly so well as frequent ablution of the whole person. Anyone will be convinced of this, who goes into a bath, and uses the flesh-brush in cleansing his body. The quantity of scurf and impurity which he will then remove, from even a body which has changes of linen once a day, will surprise him.

EXERCISE.

Bodily exercise is absolutely essential to the maintenance of good health. The human body may be regarded as a complex machine, the various parts of which are so beautifully adapted to each other, that, if one be disturbed, all must suffer. The bones and muscles are the portions of the frame on which motion most depends. There are four hundred muscles in the body, each of which has certain functions to perform that cannot be disturbed without danger to the whole, and it is a wise provision of nature that the more these muscles are exercised the stronger do they become; hence it is that laborers are stronger and more muscular than persons whose lives are passed in easy or sedentary occupations. Besides strengthening the limbs, muscular exercise has a most beneficial influence on respiration and the circulation of the blood. Says a distinguished medical writer: "Exercise tells by inciting both heart and lungs to increased action and energy, and this, done in a pure air, is great gain to the purification of the blood; but exercise does much more, for not only are the lungs, with their large capacity for air, great purifiers, but the skin is little less effective towards the same end. All know

the palpable effect of exercise upon the skin; but many are not aware that the sensible perspiration is but an increase of an insensible perspiration which is unceasingly poured out from myriads of little pores—the mouths of the sweat glands and the oil glands of the skin. The ordinary insensible perspiration is continually freeing us from a mass of impurity which cannot be retained in our system without injury. Convert the insensible perspiration into sensible, by exercise, and produce moderate sweating, and if the clothing be rational, you will give off to the winds the cause of many a headache and gloomy thoughts. Now this increased skin secretion must come from somewhere; and so it does, for the increased exertion causes increased wear and tear of system; every step works up tissue; and muscles, blood vessels, nerves, are all used quicker than when there is no action. Off go these used-up matters, probably the worst first, through lungs and skin, as fast as they can, and the man begins to feel this waste, for from all sides there are telegraphs to the stomach for supplies, and he finds himself getting excessively hungry, the dinner hour very welcome, and the formerly capricious stomach ready for anything; and so new supplies go in to supply the place of the old used-up works, and the physical man is greatly renovated—taken to pieces, as it were, and built up again.

1. In order that exercise may be truly advantageous, the parts must be in a state of sufficient health to endure the exertion. In no case must exercise be carried beyond what the parts are capable of bearing with ease; otherwise a loss of energy, instead of a gain, will be the consequence.

2. Exercise to be efficacious, even in a healthy subject, must be excited, sustained, and directed by that nervous stimulus which gives the muscles the principal part of their strength, and contributes so much to the nutrition of parts in a state of activity.

3. The waste occasioned by exercise must be duly replaced by food; as, if there be any deficiency in that important requisite, the blood will soon cease to give that invigoration to the parts upon which increased health and strength depend.

Kinds of Bodily Exercise.—Exercise is usually considered as of two kinds—active and passive. The active consists in walking, running, leaping, riding, fencing, rowing, skating, swimming, dancing, and various exercises, such as those with the poles, ropes, etc., prescribed in gymnastic institutions. The passive consists in carriage-riding, sailing, friction, swinging, etc.

Walking is perhaps the readiest mode of tak-

ing exercise, and the one most extensively resorted to. If it brought the upper part of the body as thoroughly into exertion as the lower, it would be perfect, for it is gentle and safe with nearly all except the much debilitated. To render it the more effectual in the upper part of the body it were well to walk at all times, when convenient, singly and allow the arms and trunk free play. It is best to walk with a companion, or for some definite object, as the flow of nervous energy will be by these means promoted, and the exercise be rendered, as has been already explained, the more serviceable.

Very long or rapid walks should not be attempted by individuals of sedentary habits, nor by weakly persons. Their frames are totally unprepared for such violent exertion.

Running as an Exercise.—Among the means which nature has bestowed on animals in general for the preservation and enjoyment of life, running is the most important. Since, then, it is pointed out to us by nature, it must be in a high degree innocent. It is very singular that we should apparently do all we can—which, fortunately, is not much—to make our children unlearn the art of running. Our earliest physical treatment of them seems calculated to destroy their aptitude for it; in a little time, it is too often the case that the city boy scarcely dares look as if he wished to run, we prohibit it so strongly as vulgar, and when he is more grown up gentility steps in and prohibits it altogether. Medical prejudices and our own convenience contribute likewise their share, and never allow our children, boys and girls, to acquire an art innocent of itself and necessary to all. It is possible that a person may get injury from running, but the fault is not in the exercise, but in the person who runs without having had proper training and practice.

Running should only be practiced in cool weather; as, for instance, in the late fall, winter, and early spring months.

The clothing should be light, the head bare, and the neck uncovered. As soon as the exercise is finished, warm clothing should be put on and gentle exercise continued for some time. It is not necessary to have a race course. The teacher of a school may take his pupils into the fields and find suitable ground for them. Then his pupils may exercise their bodies in other ways, acquire strength, agility, health, and the capacity of continued exertion; the will is brought into play vigorously, which is a great aid in the battle of life.

Care must be taken not to overdo, and thus, perhaps for life, weaken or injure the heart. The race, at first, should be short and fre-

quently repeated, rather than long, and full speed should not be attempted for some time.

Running is well adapted to young and middle aged persons, but not to those who are fat. Sedentary persons may find great benefit in it after the day's work is ended. If they live in cities, a quiet spot in the park may be selected, and short trials adapted to the strength entered into. Invalids may do the same thing, only they must be more careful than the robust never to over-exert themselves.

Girls may run as well as boys, and, while they cannot go so fast, they can race much more gracefully and beautifully. Indeed, there can be few more attractive sights than that of a race between beautiful girls from ten to twelve years of age. After maturity, the change in the formation of the bones of the pelvis in girls renders running less easy and graceful. In ancient Greece girls were trained to run races as well as boys, and to their superb physical culture was in great part due the grandeur and beauty of Greek life during the years of their ascendancy. The modern style of dress for young women is also entirely unsuited to running.

Fencing is of all active exercises that which is the most commendable, inasmuch as it throws open the chest, and at the same time calls into action the muscles both of the upper and lower extremities. Add to this that it improves very much the carriage of the body; for which reason it may be reckoned a branch of polite education.

Dancing is exhilarating and healthful, and seems to be almost the only active exercise which the despotic laws of fashion permit young ladies to enjoy.

Rope Jumping.—As the cool weather approaches the jumping rope may be more and more in the hands of girls. Properly used it is not an objectionable plaything. But children cannot be too frequently cautioned against jumping against time or competing to see who can jump the greatest number of times without stopping.

Repose a Condition Demanded by Exercise.—Exercise demands occasional periods of repose, and, in particular, that a certain part of every twenty-four hours be spent in sleep. After having been engaged in daily occupations for fourteen or sixteen hours, a general feeling of fatigue and weakness is induced; the motions of the body become difficult, the senses confused, the power of volition or will suspended, and the rest of the mental faculties, becoming more and more inactive, sink at length into a state of unconsciousness. The sense of sight first ceases to act by the closing of the eyelids; then the senses of taste

and smell become dormant; and then those of hearing and touch. The muscles, also, dispose themselves with a certain reference to ease of position, those of the limbs having grown indolent before those that support the head, and those that support the head before those of the trunk. In proportion as these phenomena proceed, the respiration becomes slower and more deep, the circulation diminishes in impetus, the blood proceeds in great quantity toward the head, and all the functions of the internal organs become retarded. In this state, shut out as it were from the external world, the mind still retains its wonted activity, deprived, however, of the guidance of judgment and the power of distinct recollection; in consequence of which, it does not perceive the monstrous incongruities of the imagery which sweeps before it, and takes but faint cognizance of the time which elapses.

It may be laid down as an axiom, that the more uninterrupted sleep is, the more refreshing and salutary will be its effects; for during this period, the body undoubtedly acquires an accession of nervous energy, which restlessness, however induced, must disturb; and therefore the state of the body before going to sleep, the kind of bed, and the manner of clothing, require especial attention. As the functions of the body are performed more slowly during our sleeping than our waking hours, a full meal or supper, taken immediately before going to bed, imposes a load on the stomach which it is not in a condition to digest, and the unpleasant consequence of oppressive and harassing dreams is almost certain to ensue. When the sleeper lies on his back, the heart pressing, while pulsating, on the lungs, gives rise to a sense of intolerable oppression on the chest, which seems to bear down upon the whole body, so that in this painful state not a muscle will obey the impulse of the will, and every effort to move appears to be altogether unavailing. This constitutes incubus or nightmare; and it may be observed, that, as acidity on the stomach, or indigestion, gives rise to such dreams, so all dreams of this disturbed character are converse indications of indigestion; for which reason the great physiologist Haller considered dreaming to be a symptom of disease.

The kind of bed on which we repose requires attention. Some are advocates for soft, others for hard, beds; hence some accustom themselves to feather beds, others to mattresses. The only difference between a soft and a hard bed is this—that the weight of the body in a soft bed presses on a larger surface than on a hard bed, and thereby a greater degree of comfort

is enjoyed. Parents err in fancying that a very hard bed contributes to harden the constitution of their children; for which reason they lay them down on mattresses, or beds with boarded bottoms. A bed for young children cannot be too soft, provided the child does not sink into it in such a manner that the surrounding parts of the bed bend over and cover the body. The too great hardness of beds, says Dr. Darwin, frequently proves injurious to the shape of infants, by causing them to rest on too few parts at a time; it also causes their sleep to be uneasy and unrefreshing. Whatever be the time chosen for sleep, it is evident that no person can with impunity convert day into night. Eight o'clock for children, and eleven for adults, may be recommended as good hours for retiring to rest. It is well known that children require more sleep than adults; and more sleep is requisite in winter than in summer. The average duration of sleep which may be recommended for adults is eight hours; but much depends upon habit, and many persons require only six. It is scarcely necessary to observe that, on rising in the morning, the strictest attention should be paid to washing the face, neck, and hands; the mouth and teeth should also be well cleansed. The most simple powder for the teeth is finely brayed charcoal, a little of which will clear away all impurities, and preserve the teeth. On leaving the bedroom, the windows should be opened, and the clothes of the bed turned down, in order that the exhalations of the body during sleep may be dissipated. If, instead of this, the bed be made immediately after we have risen, these exhalations are again folded up with the clothes—a practice which is not consonant either with cleanliness or health.

Overworking the Undeveloped Brain.—“Overwork,” properly so-called, can only occur when the organ upon which the stress of the labor falls is as yet immature, and, therefore, in process of development. When an organ has reached the maturity of its growth it can only work up to the level of its capacity or faculty for work! Fatigue may produce exhaustion, but that exhaustion will come soon enough to save the organ. Repeated “efforts” may, under abnormal conditions, follow each other too rapidly to allow of recuperation in the intervals of actual exertion, and as the starting point will, in each successive instance, be lower than the previous state, there may be a gradual abasement; but even this process should not seriously injure a healthy and well developed organ. In short, a great deal of nonsense has been said and written about the “overwork” of mature

brains, and there are grounds for believing that an excuse has been sought for idleness, or indulgence in a valetudinarian habit, in the popular outcry on this subject which awhile ago attracted much attention. Nevertheless there can be no room to question the extreme peril of "overwork" to growing children and youths with undeveloped brains.

The excessive use of an immature organ arrests its development by diverting the energy which should be appropriated to its growth, and consuming it in work. What happens to horses which are allowed to run races too early happens to boys and girls who are overworked at school. The competitive system as applied to youths has produced a most ruinous effect on the mental constitution which this generation has to hand down to the next, and particularly the next but one ensuing. School work should be purely and exclusively directed to development. "Cramming" the young for examination purposes is like compelling an infant in arms to sit up before the muscles of its back are strong enough to support it in the upright position, or to sustain the weight of its body on its legs by standing while as yet the limbs are unable to bear the burden imposed on them.

A crooked spine or weak or contorted legs is the inevitable penalty of such folly. Another blunder is committed when one of the organs of the body—to wit, the brain—is worked at the expense of other parts of the organism, in face of the fact that the measure of general health is proportioned to the integrity of development, and the functional activity of the body as a whole in the harmony of its component systems. No one organ can be developed at the expense of the rest without a corresponding weakening of the whole.

Mental Exercise.—The same rules and regulations by which exercise may be serviceable to the physical system, hold good respecting the mental faculties. These, as is generally allowed, however immaterial in one sense, are connected organically with the brain—a portion of the animal system nourished by the same blood, and regulated by the same vital laws, as the muscles, bones, and nerves. As, by disuse, muscle becomes emaciated, bone softens, blood vessels are obliterated, and nerves lose their natural structure, so, by disuse, does the brain fall out of its proper state, and create misery to its possessor; and as, by over-exertion, the waste of the animal system exceeds the supply, and debility and unsoundness are produced, so, by over-exertion, are the functions of the brain liable to be deranged and destroyed. The processes are physiologically the same, and the effects bear an exact rela-

tion to each other. As with the bodily powers, the mental are to be increased in magnitude and energy by a degree of exercise measured with a just regard to their ordinary health and native or habitual energies. Corresponding, moreover, to the influence which the mind has in giving the nervous stimulus so useful in bodily exercise, is the dependence of the mind upon the body for supplies of healthy nutriment; and, in like manner with the bodily functions, each mental faculty is only to be strengthened by the exercise of itself in particular.

It ought to be universally known, that the uses of our intellectual nature are not to be properly realized without a just regard to the laws of that perishable frame with which it is connected; that, in cultivating the mind, we must neither overtask nor undertask the body, neither push it to too great a speed, nor leave it neglected; and that, notwithstanding this intimate connection and mutual dependence, the highest merits on the part of the mind will not compensate for muscles mistreated, or soothe a nervous system which severe study has tortured into insanity. To come to detail, it ought to be impressed on all, that to spend more than a moderate number of hours in mental exercise diminishes insensibly the powers of future application, and tends to abbreviate life; that no mental exercise should be attempted immediately after meals, as the processes of thought and of digestion cannot be safely prosecuted together; and that, without a due share of exercise to the whole of the mental faculties, there can be no soundness in any, while the whole corporeal system will give way beneath a severe pressure upon any one in particular. These are truths completely established with physiologists, and upon which it is undeniable that a great portion of human happiness depends.

THE HUMAN PULSE.

The phenomenon known as the arterial pulse or arterial pulsation is due to the distention of the arteries consequent upon the intermittent injection of blood into their trunks, and the subsequent contraction which results from the elasticity of their walls. It is perceptible to the touch in all excepting very minute arteries, and, in exposed positions, is visible to the eye. The pulse is usually examined at the radial artery at the wrist, the advantages of that position being that the artery is very superficial, and that it is easily compressed against the bone. It is usual and convenient, though not quite accurate, to include under the term the conditions observed between the beats, as well as those produced by them.

The condition of the pulse depends mainly on two factors, each of which may vary independently of the other: First, the contraction of the heart, which propels the stream of blood along the artery; and, second, the resistance in the small arteries and capillaries, which controls the rate at which it leaves the artery. The first determines the frequency and rhythm of the pulse and the force of the beats; but the tension of the artery between them and their apparent duration depends mainly upon the peripheral resistance. "Feeling the pulse," therefore, gives important information besides the rate of the heart's action, and implies much more than the mere counting of pulsations. Dr. Broadbent says: "A complete account of the pulse should specify (1) the frequency—i. e., the number of beats per minute, with a note of any irregularity or intermission or instability of the rhythm; (2) the size of the vessel; (3) the degree of distention of the artery between the beats; (4) the character of the pulsation—whether its access is sudden or gradual, its duration short or long, its subsidence abrupt or slow, note being taken of diastole, when present; (5) the force or strength of both the constant and variable pressure within the artery, as measured by its compressibility; (6) the state of the arterial walls."

The frequency of the pulse varies with age, from 130 to 140 per minute at birth to 70 to 75 in adult males, and with sex, being six or eight beats more in adult females. In some individuals it deviates considerably from this standard, and may even be habitually below forty or above ninety without any signs of disease. It is increased by exertion or excitement, by food or stimulants, diminished in a lying posture or during sleep. In disease (acute hydrocephalus, for example), the pulse may reach 150 or even 200 beats; or, on the other hand (as in apoplexy and in certain organic affections of the heart, it may be as slow as between 30 and 20.

The normal regular rhythm of the pulse may be interfered with either by the occasional dropping of a beat (intermission), or by variations in the force of successive beats, and in the length of the intervals separating them (irregularity). These varieties often occur in the same person, but they may exist independently of each other. Irregularity of the pulse is natural to some persons; in others it is the mere result of debility; but it may be caused by the most serious disorders, as by disease of the brain, or by organic disease of the heart.

The other qualities of the pulse are much more difficult to recognize though of no less importance. The degree of tension or resist-

ance to compression by the fingers varies greatly: in a soft or "low tension" pulse the artery may be almost imperceptible between the beats; in a hard or "high tension" pulse it may be almost incompressible. An unduly soft pulse is usually an indication of debility; an unduly hard one is most often characteristic of disease of the kidneys and gout. But the tension, like the frequency of the pulse, undergoes considerable variations in health from temporary causes, and may in certain individuals be habitually above or below the average without actual disease.

The force of the beats is a measure of the vigor and efficiency of the heart's action. A strong pulse is correctly regarded as a sign of a vigorous state of the system; it may, however, arise from hypertrophy of the left ventricle of the heart, and remain as a persistent symptom even when the general powers are failing. As strength of the pulse usually indicates vigor, so weakness of the pulse indicates debility. Various expressive adjectives have been attached to special conditions of the pulse, into the consideration of which our space will not permit us to enter. Thus, we read of the jerking pulse, the hobbling pulse, the corded pulse, the wiry pulse, the thrilling pulse, the rebounding pulse, etc. The full significance of changes of the pulse in disease can only be appreciated by considering them in connection with the other signs and symptoms of the case.

Average frequency at different ages in health.

| AGES: | BEATS PER MINUTE: |
|-----------------------------|----------------------|
| In the fetus in utero..... | between 150 and 140 |
| Newborn infants..... | between 140 and 120 |
| During the first year..... | from 130 down to 115 |
| During the second year..... | from 120 down to 100 |
| During the third year..... | from 105 down to 95 |
| From 7th to 14th year..... | from 90 down to 80 |
| From 14th to 21st year..... | from 85 down to 75 |
| From 21st to 60th year..... | from 75 down to 70 |
| In old age..... | between 75 and 70 |

Co-Relation of Pulse and Temperature.—As a general rule the co-relation of pulse and temperature may be stated as follows, namely:—

An increase of temperature of one degree above 98° F. corresponds with an increase of ten beats of the pulse per minute, as in the following table:—

| | |
|---|--|
| Temperature of 98° corresponds with a pulse of 60 | |
| " 99° " " " " " 70 | |
| " 100° " " " " " 80 | |
| " 101° " " " " " 90 | |
| " 102° " " " " " 100 | |
| " 103° " " " " " 110 | |
| " 104° " " " " " 120 | |
| " 105° " " " " " 130 | |
| " 106° " " " " " 140 | |

Thermometry.—In children the temperature is normally one or two degrees higher than in adults.

The temperature is normally one degree higher under the tongue than in the axilla. It is highest upon awakening in the morning; lowest at midnight.

A rise of one degree in temperature usually marks an increase of the pulse from six to ten beats a minute.

Continued temperature above 98.50° indicates prostration and illness; 101° to 105°, severe fever; 105° to 108°, danger; 108° to 109°, impending death.

A temperature of 105° or 106° on the first day of illness, is *prima facie* evidence of ephemeral fever; it is not typhoid or typhus, but probably malarious.

Though the typical evidences of pneumonia are present, if the thermometer fails to reach 101.70°, it may be concluded no soft infiltration of lungs is present.

High temperature after the eruption of measles has faded, indicates complications. An evening typhoid temperature of 103.5° indicates a mild course of fever; 105° in the evening or 104° in the morning, in the third week, indicates danger. A temperature of 104° and upwards, in pneumonia, indicates a severe attack. A temperature of 104° is always alarming in acute rheumatism; look for cardiac complications. In jaundice a rise of temperature is unfavorable. A rise of temperature in a puerperal female indicates the approach of pelvic inflammation. An increase of temperature in tuberculosis shows an advance of the disease, or rise of complications.

Daily fluctuations of temperature are associated with malarial fever, typhus, typhoid, exanthemata, rheumatism, pyæmia, pneumonia, and acute tuberculosis. An even temperature from morning until evening is favorable. A high temperature from evening until morning is unfavorable. A falling temperature from evening until morning is favorable. A rising temperature from evening until morning is dangerous. The temperature of the body must be normal before convalescence begins.

Respiration.

| | |
|----------------------------------|---------------|
| Two months to two years..... | 35 per minute |
| Two to six years..... | 23 " " |
| Six to twelve years..... | 20 " " |
| Twelve to fifteen years..... | 18 " " |
| Fifteen to twenty-one years..... | 16 to 18 " " |

Respiration and pulsation in the adult female is usually a trifle faster than in the male, especially during pregnancy.

ALE.

This a liquor manufactured from malt, which is usually produced from the parched grain of germinating barley by a process of great antiquity called brewing. It can, how-

ever, be made from the dried germinating grain of wheat and other cereals; any substance containing sugar being capable of yielding a wort or solution which may be fermented or converted into ale or beer. In several of the English pale ales the proportion of alcohol is as high as 10 per cent., and the average is from 5 to 7 per cent. So that a pint of good ale contains the same amount of alcohol as a bottle of claret. These ales, with those of Scotland, are largely imported, and are generally much superior to the American product. Burton ale, so called from the place where it is made, is one of the strongest and most intoxicating. It is of a somewhat thick, glutinous consistence, and sweetish to the taste; a small quantity of it produces intoxication in those who are not accustomed to it. The best English ales are Bass and Allsopp's. Scotch ale, especially the Edinburgh brands, has a pale flavor, extremely vinous and very like some of the light French wines. It is mild in its effect, pale in color, and the taste of the hops does not predominate as in the India pale ale (manufactured especially for the Indian market) and Allsopp's. Scotch ales are also said to be less liable to adulteration than the English. American ales are very light, as compared with many foreign products, but they contain alcohol sufficient to intoxicate, even when taken in small quantities, by those not accustomed to alcoholic stimulants. Often, too, ingredients are used which are injurious to the system, in addition to the poison of the alcohol.

BATH.

The skin of the human being is not merely an outward covering for the body, but an organ the proper performance of whose work is of vital importance to good health. Its seven million pores are not a useless part of the animal economy, but form the sluices through which the system throws off a portion of its waste and deleterious matter; this matter is removed in the form of an imperceptible watery vapor, mixed with a few saline and gaseous substances, and the quantity capable of being gotten rid of in this way, in the space of twenty-four hours, amounts in round numbers to twenty ounces. The retention of this, by reason of the inability of the skin to perform its functions, is of course productive of great injury to the system, throwing more than their due share of work on the other secretive organs. The only method of keeping the skin clear and in proper working order is bathing with sufficient frequency. Bathing not only removes the matter which the skin has already discharged, but stimulates its activity, and in-

creases its efficiency. The temperature of the water is a highly important circumstance, and medical writers usually classify baths, as cold, warm, and hot.

Cold Bath.—The cold bath is taken in water which is cold as compared with the normal heat of the body, or at a temperature of 33° to 65°. The effect of such a bath on a person in good health is, on first plunging in, a sensation of extreme cold (the duration of which depends on the temperature of the water and the condition of the bather), and is followed by a reaction which brings on a sensation of warmth and a feeling of lightness and vigor. By degrees, if the body continue to be immersed, the bather again begins to feel cold, chilliness, accompanied by shivering, comes on, the pulse grows feebler and slower, and the whole body becomes languid and powerless. The time to leave the bath is during the period of warmth, before the second chilliness begins; and immediately on stepping out the bather should rub himself dry with a coarse towel, and continue rubbing till the skin is in a glow. The ultimate effect of the cold bath has been differently described by different physicians, and some are strongly opposed to its use at all; but, where it agrees, it is tonic and bracing, it improves the digestion, stimulates the skin, and renders the circulation more active and vigorous. It also hardens the system and causes it to be much less sensitive to changes of temperature, being on this account an excellent protection against taking cold on exposure. Its beneficial effect depends much on the strength of the reaction; if, therefore, on coming out of the cold bath, the person feels dull and chilly, or complains of headache, or a sensation of tightness across the chest, the cold bath disagrees, and should be discontinued or modified.

But many persons experiencing these symptoms seem to need just the sort of stimulus the cold bath gives. This they can get by applying cold water with a wash rag to a square foot or two of the skin at a time, rubbing the space into a glow with a towel, and repeating the process until the whole body has been bathed. The writer knows instances where this method has cured people too sensitive to cold.

The diseases for which cold baths are valuable as a remedy are morbid irritability and sensibility, accompanied by general debility; also for asthma, in the intervals between the paroxysms, when the system is in other respects in a proper condition for it. When there is a tendency to colds and rheumatism, the cold bath is an excellent preventive; for this purpose it should be used continuously

throughout the year. It is improper in the case of those who have a tendency to consumption, or who are constitutionally liable to bowel complaints; and it should never be ventured on by anyone suffering from chronic inflammation of the mucous membranes of the bronchia and intestinal canal. The best time for taking a cold bath is in the early morning just after rising. But persons of feeble circulation in whom reaction does not readily follow, had better not take a cold bath before their breakfast is digested.

Warm Bath.—This includes all baths ranging in temperature from 66° to 95°. Its effect is very different from that of the cold bath. There is no shock, but the temperature is grateful to the bather; the blood circulates more rapidly, and a gentle glow pervades the body; the skin absorbs water, is softened, and throws off the scales of decomposed matter which may have accumulated on it; pain is allayed, and nervous irritation is soothed. The warm bath is especially grateful and beneficial after excessive muscular exertion, or after the fatigue and excitement of traveling. It refreshes and tranquilizes the system; but, on the other hand, it has none of the tonic influence of the cold bath, and its frequent use tends to relax and debilitate, while rendering the system more sensible to changes of temperature. The best temperature for the bath of a healthy person is what is called tepid, and it is also the most agreeable. A distinctly warm bath taken just before going to bed will probably cure any tendency to wakefulness, especially if the wakefulness come from overuse of the brain. No bath whatever should be taken while digestion is going on—say in less than two hours after a meal.

Hot Bath.—This has a temperature ranging from 98° (blood-heat) to 112°. It is a very powerful stimulant, and should never be used by persons in a good state of health. Even in cases of disease, it should only be taken under a physician's advice. As the object is to stimulate the vital actions, the bather should never remain long enough in the bath to produce exhaustion,—the average time is from ten to fifteen minutes. The best way to obtain the full beneficial effect of the hot bath is to commence with tepid water and gradually increase the temperature. The hot bath is chiefly used where it is desirable to produce abundant perspiration, when it should be followed by rolling the patient in blankets.

Shower Bath.—When cold water is used, the effect of this bath is similar to that of the ordinary cold bath, but the shock from the shower bath is greater than that from simple immersion, especially if the quantity of water

be large, the temperature low, and the fall considerable. Its effects are also more speedy, and extend more to the internal organs than those of the common bath. When the result is beneficial the glow is felt almost immediately, consequently, when recourse is had to it, the bather should withdraw immediately after the shock; if its use is prolonged it quickly lowers, and at last destroys the sensibility, and is then highly injurious. For delicate persons, the tepid shower bath is preferable; and salt added to the water is an improvement. When used for hygienic purposes the best time to take the shower bath is immediately after rising in the morning. Vigorous rubbing and overexertion should be guarded against immediately following the bath.

SMALL POINTS ON TABLE ETIQUETTE.

Delicacy of manner at table stamps both man and woman, for one can, at a glance, discern whether a person has been trained to eat well—i. e., to hold the knife and fork properly, to eat without the slightest sound of the lips, to drink quietly, to use the napkin rightly, to make no noise with any of the implements of the table, and last, but not least, to eat slowly and masticate the food thoroughly. All these points should be most carefully taught to children, and then they will always feel at their ease at the grandest tables in the land. There is no position where the innate refinement of a person is more fully exhibited than at the table, and nowhere that those who have not been trained in table etiquette feel more keenly their deficiencies. The knife should never be used to carry food to the mouth, but only to cut it up into small mouthfuls; then place it upon the plate at one side, and take the fork in the right hand, and eat all the food with it. When both have been used finally, they should be laid diagonally across the plate, with both handles toward the right hand; this is understood by well-trained waiters to be the signal for removing them, together with the plate.

Be careful to keep the mouth shut closely while masticating the food. It is the opening of the lips which causes the smacking which seems very disgusting. Chew your food well, but do it silently, and be careful to take small mouthfuls. The knife can be used to cut the meat finely, as large pieces of meat are not healthful, and appear very indelicate. At many tables, two, three, or more knives and forks are placed on the table, the knives at the right hand of the plate, the forks at the left, —a knife and a fork for each course, so that there need be no replacing of them after the

breakfast and dinner is served. The smaller ones, which are for game, dessert, or for hot cakes at breakfast, can be tucked under the edges of the plate, and the large ones, for the meat and vegetables, are placed outside of them. Be very careful not to clatter your knives and forks upon your plates, but use them without noise. When passing the plate for a second helping, lay them together at one side of the plate, with handles to the right. When you are helped to anything, do not wait until the rest of the company are provided, it is not considered good breeding. Soup is always served for the first course, and it should be eaten with dessert spoons, and taken from the sides, not the tips of them, without any sound of the lips, and not sucked into the mouth audibly from the ends of the spoon. Bread should not be broken into soup or gravy. Never ask to be helped to soup a second time. The hostess may ask you to take a second plate, but you will politely decline. Fish chowder, which is served in soup plates, is said to be an exception which proves this rule, and when eating of that it is correct to take a second plateful if desired.

Another generally neglected obligation is that of spreading butter on one's bread as it lies on one's plate, or but slightly lifted at one end of the plate; it is very frequently buttered in the air, bitten in gouges, and still held in the face and eyes of the table with the marks of the teeth on it. This certainly is not altogether pleasant, and it is better to cut it, a bit at a time, after buttering it, and put piece by piece in the mouth with one's finger and thumb. Never help yourself to butter, or any other food with your own knife or fork. It is not considered good taste to mix food on the same plate. Salt must be left on the side of the plate, and never on the tablecloth.

Let us mention a few things concerning the eating of which there is sometimes doubt. A cream cake and anything of similar nature should be eaten with knife and fork, never bitten. Asparagus — which should be always served on bread or toast so as to absorb superfluous moisture — may be taken from the finger and thumb; if it is fit to be set before you, the whole of it may be eaten. Pastry should be broken and eaten with a fork, never cut with a knife. Raw oysters should be eaten with a fork, also fish. Pease and beans, as we all know, require the fork only; however, food that cannot be held with a fork should be eaten with a spoon. Potatoes, if mashed, should be mashed with the fork. Green corn should be eaten from the cob; but it must be held with a single hand.

Celery, cresses, olives, radishes, and relishes

of that kind are, of course, to be eaten with the fingers; the salt should be laid upon one's plate, not upon the cloth. Fish is to be eaten with the fork, without the assistance of the knife; a bit of bread in the left hand sometimes helps one to master a refractory morsel. Fresh fruits should be eaten with a silver-bladed knife, especially pears, apples, etc.

Berries, of course, are to be eaten with a spoon. In England they are served with their hulls on, and three or four are considered an ample quantity. But then, in England they are many times the size of ours; there they take the big berry by the stem, dip into powdered sugar, and eat it as we do the turnip radish. It is not proper to drink with a spoon in the cup; nor should one, by the way, ever quite drain a cup or glass.

Don't, when you drink, elevate your glass as if you were going to stand it inverted on your nose. Bring the glass perpendicularly to the lips, and then lift it to a slight angle. Do this easily.

Drink sparingly while eating. It is far better for the digestion not to drink tea or coffee until the meal is finished. Drink gently, and do not pour it down your throat like water turned out of a pitcher.

When seating yourself at the table, unfold your napkin and lay it across your lap in such a manner that it will not slide off upon the floor; a gentleman should place it across his right knee. Do not tuck it into your neck, like a child's bib. For an old person, however, it is well to attach the napkin to a napkin hook and slip it into the vest or dress button-holes, to protect the garments, or sew a broad tape at two places on the napkin, and pass it over the head. When the soup is eaten, wipe the mouth carefully with the napkin, and use it to wipe the hands after meals. Finger bowls are not a general institution, and yet they seem to be quite as needful as the napkin, for the fingers are also liable to become a little soiled in eating. They can be had quite cheaply, and should be half filled with water, and placed upon the side table or butler's tray, with the dessert, bread and cheese, etc. They are passed to each person half filled with water, placed on a parti-colored napkin with a dessert plate underneath, when the dessert is placed upon the table. A leaf or two of sweet verbena, an orange flower, or a small slice of lemon, is usually put into each bowl to rub upon the fingers. The slice of lemon is most commonly used. The finger tips are slightly dipped into the bowl, the lemon juice is squeezed upon them, and then they are dried softly upon the napkin. At dinner parties and luncheons they are indispensable.

Spoons are sometimes used with firm puddings, but forks are the better style. A spoon should never be turned over in the mouth.

Ladies have frequently an affected way of holding the knife half-way down its length, as if it were too big for their little hands; but this is as awkward a way as it is weak; the knife should be grasped freely by the handle only, the forefinger being the only one to touch the blade, and that only along the back of the blade at its root, and no further down.

At the conclusion of a course, where they have been used, knife and fork should be laid side by side across the middle of the plate—never crossed; the old custom of crossing them was in obedience to an ancient religious formula. The servant should offer everything at the left of the guest, that the guest may be at liberty to use the right hand. If one has been given a napkin ring, it is necessary to fold one's napkin and use the ring; otherwise the napkin should be left unfolded.

Never, if possible, cough or sneeze at the table. If you feel the paroxysm coming on, leave the room. It may be worth while to know that a sneeze may be stifled by placing the finger firmly upon the upper lip.

POSOLOGICAL TABLE.

Medicines, with doses for adults. For patients over 20 years of age, the full dose; from 14 to 20 years, $\frac{3}{4}$ of full dose; 7 to 14 years, $\frac{1}{2}$ dose; 4 to 7 years, $\frac{1}{3}$ dose; 3 years, $\frac{1}{4}$ dose; 2 years, $\frac{1}{5}$ dose; 1 year, $\frac{1}{6}$ dose.

| MEDICINE. | DOSE. |
|--------------------------------------|--|
| Arsenic, Fowler's Solution of | 2 to 10 drops |
| Aconite, Extract of | $\frac{1}{4}$ to $\frac{1}{2}$ grain |
| Aconite, Tincture of | 1 to 5 drops |
| Aloes, Purified | 1 to 5 grains |
| Aloes, Pills of | 1 to 4 pills |
| Aloes, Pills of Asafoetida and | 1 to 4 pills |
| Asafoetida, Mixture of | $\frac{1}{2}$ to 2 tablespoonfuls |
| Asafoetida, Tincture of | $\frac{1}{2}$ to 2 tablespoonfuls |
| Asafoetida, Pills of | 1 to 4 pills |
| Atropia, Sulphate of | $\frac{1}{16}$ to $\frac{1}{8}$ of a grain |
| Belladonna, Extract of | $\frac{1}{4}$ to 1 grain |
| Belladonna, Fluid Extract of | 1 to 5 drops |
| Belladonna, Tincture of | 5 to 30 drops |
| Bismuth, Subnitrate of | 10 to 30 grains |
| Bromide of Ammonia | 5 to 20 grains |
| Bromide of Potassium | 5 to 20 grains |
| Bromide of Sodium | 5 to 20 grains |
| Buchu, Fluid Extract of | 10 to 60 drops |
| Calabar Bean, Extract of | $\frac{1}{2}$ to 1 grain |
| Calomel | $\frac{1}{2}$ to 10 grains |
| Camphor, Spirits of | 5 to 15 drops |
| Camphor Water | 1 to 4 teaspoonfuls |
| Capicum, Tincture of | 10 to 20 drops |
| Castor Oil | $\frac{1}{4}$ to 2 tablespoonfuls |
| Chloral, Hydrate of | 5 to 30 grains |
| Cinchona, Sulphate of | 5 to 30 grains |
| Cinchona, Compound Tincture of | 1 to 4 teaspoonfuls |
| Cod Liver Oil | $\frac{1}{2}$ to 1 tablespoonful |
| Copper, Sulphate of | $\frac{1}{4}$ to $\frac{1}{2}$ grain |
| Corrosive Sublimate | $\frac{1}{16}$ to $\frac{1}{8}$ grain |
| Cream of Tartar | 5 to 60 grains |
| Croton Oil | 1 to 2 drops |
| Digitalis, Extract of | $\frac{1}{4}$ to 2 grains |
| Digitalis, Tincture of | 5 to 60 drops |
| Dover's Powder | 5 to 10 grains |
| Epsom Salts | $\frac{1}{2}$ to 2 tablespoonfuls |
| Ergot, Fluid Extract of | $\frac{1}{4}$ to 2 teaspoonfuls |

| Zinc, Oxide of..... | $\frac{1}{2}$ to 5 grains |

DISINFECTANTS AND HOW TO USE THEM.

The National Board of Health of the United States of America, consisting of a number of our leading physicians and chemical experts, of which Professor C. F. Chandler of New York was chairman, have issued the following instructions for disinfection, intended especially for the guidance of physicians and nurses in the yellow fever districts, but which are equally applicable in other classes of contagious diseases. In submitting this report the chairman says:—

It has been the aim of the committee to prepare concise directions for disinfection, so simple and clear that they may be easily followed by any person of intelligence.

In the selection of disinfecting agents the aim has been: 1st, to secure agents which can be relied upon to accomplish the work; 2d, which can be procured in a state of comparative purity in every village in the United States; 3d, so cheap that they may be used in adequate quantities.

It is extremely important that the people

should be instructed with regard to disinfection. They must be taught that no reliance can be placed upon disinfectants simply because they smell of chlorine or carbolic acid, or possess the color of permanganate, and that, in general, proprietary disinfectants with high-sounding names are practically worthless, as they either have no value whatever, or, if value, cost many times as much as they are worth, and cannot be used in sufficient quantity.

Explanations.—Disinfection is the destruction of the poisons of infectious and contagious diseases.

Deodorizers, or substances which destroy smells, are not necessarily disinfectants, and disinfectants do not necessarily have odor.

Disinfection cannot compensate for want of cleanliness or ventilation.

I.—DISINFECTANTS TO BE EMPLOYED.

1. Roll sulphur (brimstone) for fumigation.

2. Sulphate of iron (copperas) dissolved in water in the proportion of one and a half pounds to the gallon; for soil, sewers, etc.

3. Sulphate of zinc and common salt, dissolved together in water in the proportion of four ounces sulphate and two ounces salt to the gallon; for clothing, bed linen, etc.

NOTE.—Carbolic acid is not included in the above list for the following reasons: It is very difficult to determine the quality of the commercial article, and the purchaser can never be certain of securing it of proper strength; it is expensive, when of good quality, and experience has shown that it must be employed in comparatively large quantities to be of any use; it is liable by its strong odor to give a false sense of security.

II.—HOW TO USE DISINFECTANTS.

1. *In the Sick Room.*—The most available agents are fresh air and cleanliness. The clothing, towels, bed linen, etc., should at once, on removal from the patient, be placed in a pail or tub of the zinc solution, boiling hot if possible, before removal from the room.

All discharges should either be received in vessels containing copperas solution, or, when this is impracticable, should be immediately covered with copperas solution. All vessels used about the patient should be cleansed with the same solution.

Unnecessary furniture—especially that which is stuffed—carpets and hangings, when possible, should be removed from the room at the outset; otherwise, they should remain for subsequent fumigation and treatment.

2. *Fumigation with sulphur* is the only practicable method for disinfecting the house.

For this purpose the rooms to be disinfected must be vacated. Heavy clothing, blankets, bedding, and other articles which cannot be treated with zinc solution, should be opened and exposed during fumigation, as directed below. Close the rooms as tightly as possible, place the sulphur in iron pans supported upon bricks, set it on fire by hot coals, or with the aid of a spoonful of alcohol, and allow the room to remain closed for twenty-four hours. For a room about ten feet square, at least two pounds of sulphur should be used; for larger rooms, proportionally increased quantities.

3. *Premises.*—Cellars, yards, stables, gutters, privies, cesspools, water-closets, drains, sewers, etc., should be frequently and liberally treated with copperas solution. The copperas solution is easily prepared by hanging a basket containing about sixty pounds of copperas in a barrel of water.

4. *Body and Bed Clothing, etc.*—It is best to burn all articles which have been in contact with persons sick with contagious or infectious diseases. Articles too valuable to be destroyed should be treated as follows:—

a. Cotton, linen, flannels, blankets, etc., should be treated with the boiling hot zinc solution, introducing piece by piece, securing thorough wetting, and boiling for at least half an hour.

b. Heavy woolen clothing, silks, furs, stuffed beds covers, beds, and other articles which cannot be treated with the zinc solution, should be hung in the room during fumigation, pockets being turned inside out, and the whole garment thoroughly exposed. Afterward they should be hung in the open air, beaten, and shaken. Pillows, beds, stuffed mattresses, upholstered furniture, etc., should be cut open, the contents spread out and thoroughly fumigated. Carpets are best fumigated on the floor, but should afterward be removed to the open air and thoroughly beaten.

SLEEPLESSNESS.

Nothing lowers the vital forces more than sleeplessness, which may generally be traced to one of four causations: (1) mental worry; (2) a disordered stomach; (3) excessive muscular exertion; (4) functional or organic disease. Loss of sleep is, when rightly understood, one of Nature's premonitory warnings that some of her physical laws have been violated. When we are troubled with sleeplessness, it becomes requisite to discover the primary cause, and then to adopt suitable means for its removal. When insomnia, or sleeplessness, arises from mental worry, it is indeed most difficult to remove. The best and perhaps the only effectual plan under such circum-

stances to reach the root of the disorder is a spare diet, combined with plenty of outdoor exercise, thus to draw the blood from the brain; for it is as impossible for the brain to continue active without a due circulation of blood as it is for an engine to move without steam.

When suffering from mental distress, a hot soap bath before retiring to rest is an invaluable agent for obtaining sleep, as by its means a more equable blood pressure becomes established, promoting a decrease of the heart's action and relaxation of the blood vessels. Many a sleepless night owes its origin to the body's temperature being unequal. In mental worry, the head is often hot and the feet cold, the blood being driven to the brain. The whole body should be well washed over with carbolic soap and sponged with very hot water. The blood then becomes diverted from the brain, owing to an adequate diffusion of circulation. Tea and coffee should not be taken of an evening when persons suffer from insomnia, as they directly induce sleeplessness, being nervine stimulants. A sharp walk of about twenty minutes is also very serviceable before going to bed.

Sleeplessness is sometimes engendered by a disordered stomach. Whenever this organ is overloaded, its powers are disordered, and wakefulness or a restless night is its usual accompaniment. Dr. C. J. B. Williams, F.R.S., remarks that no food should be taken at least within one hour of bedtime. It cannot be too generally realized that the presence of undigested food in the stomach is one of the most prevailing causes of sleeplessness.

Persons suffering from either functional or organic disease are peculiarly liable to sleeplessness. When inability to sleep persistently occurs, and cannot be traced to any perverted mode of life or nutrition, there is good reason for surmising that some latent malady gives rise to a condition so truly distressing. Under these circumstances, instead of making bad worse, by swallowing deadly sleeping drugs, a scientific physician should be without delay consulted. Functional disorders of the stomach, liver, and heart, are often the primary source of otherwise unaccountable wakefulness.

Recently the dangerous and lamentable habit of promiscuously taking sleeping draughts has unfortunately become very prevalent, entailing misery and ill health to a terrible degree. Most persons addicted to this destructive practice erroneously think that it is better to take a sleeping draught than lie awake. A greater mistake could hardly exist. All opiates more or less occasion mischief, and even the state of stupefaction they induce utterly

fails to bring about that revitalization resulting from natural sleep. The physiological effect of hypnotics, or sleeping draughts, upon the system is briefly as follows: (1) They paralyze the nerve centers and disorder the stomach, rendering it unfit for its duties; witness the sickness and loss of appetite consequent upon a debauch. Chloral, chloroform, opium, etc., act upon the system much in the same way as inebriation. (2) One and all anæsthetics introduced into the body have life-destroying properties in a low degree—proved by an overdose being fatal. (3) The condition they produce is not sleep, but a counterfeit state of unconsciousness. (4) They directly poison the blood, consequent upon its carbonization, resulting from their action. While speaking of sedatives, we cannot omit drawing special attention to chloral. This powerful drug is popularly supposed to give a quiet night's rest, without any of the after effects (headache, etc.) produced by various preparations of morphia. Now chloral is what is termed cumulative in its action, which implies that even the same dose, persisted in for a certain length of time, may cause death. Of all hypnotics, chloral is by far the most deadly, and should never, under any circumstances, be taken except under medical supervision.

To epitomize what has already been said regarding sleeplessness: its rational cure should be arrived at in each individual case by seeking out the cause, and then removing the morbid action, of which it is but a natural sequence.

Lastly, sleeplessness, under no circumstances, should be neglected, as it acts disastrously both on the mental and physical forces.

DRUGS.

In purchasing drugs, whether in the raw state or in the form of extracts, tinctures, etc., it is very important to obtain them from a reputable chemist, who will take care that the article is genuine and properly labeled. The adulteration of drugs is carried on to an enormous extent, and, as commonly sold by irresponsible parties, the strength is seldom above one half of what it ought to be. Besides this, there is the danger of substituting a cheap drug for a dear one. Drugs are, most of them, soon spoiled by keeping, and in all cases they should be preserved in well-stoppered bottles—with the exception of Epsom salts, niter, soda, and some few others, which will keep without injury for an indefinite time. All vegetable medicines lose their virtues in the course of a few months, if not carefully closed from the air; and even in bottles, they seldom keep good for a year. It is desirable, therefore, to purchase them in small quantities at a

time, and to renew them at intervals of twelve months. Most drugs simply lose their strength with time; but laudanum, on the contrary, becomes stronger, especially if it be left uncorked; the spirit evaporates, leaving almost pure opium. This must be guarded against, as the most fatal results might occur from giving a dose much greater (in point of strength) than was intended.

A few drugs requiring extended notice are given under separate titles in this work.

The additional ones given below are least liable to abuse, in family use. Each is introduced in alphabetical order, with its properties and effects given under the respective heads—(a) *Physical properties*; (b) *Therapeutical effects*; (c) *Use*; and (d) *Dose and mode of administration*. Extracts, tinctures, and all such compounds as will bear keeping, and are likely to be useful in a family, are better when bought of a good druggist than as made at home. They are therefore given without direction to manufacture. It should be borne in mind, however, that drugs of any kind should be used very sparingly except by direction of a physician.

Acid, Acetic. Vinegar distilled from wood, and purified.

(a) *Physical properties.* Limpid, colorless, volatile; odor, pungent and fragrant; taste, acid.

(b) *Therapeutical effects.* Stimulant, escharotic, but, when diluted with water, cooling.

(c) *Used* in lotions for cooling purposes diluted with water, also in ringworm and removing warts.

(d) *Dose.* It is not given internally, except in combination with other medicines.

Acid, Acetic (diluted). Diluted acetic acid, prepared from the acid just described.

(a) *Physical properties.* A clear acid fluid.

(b) *Therapeutical effects.* Astringent, diaphoretic, cooling, and antiseptic. It is useful in making the acetate of lead more soluble. Externally, it is stimulant in its full strength, or, when mixed with water, cooling.

(c) *Used* in fevers internally; or as a gargle with capsicum; or as an inhalation in sore throat. A useful lotion when mixed with spirit and water, in bruises, sprains, and burns.

(d) *Dose.* Half a drachm to one drachm.

Acid, Benzoic.

(a) *Physical properties.* White and shining crystals, with flakes of a fragrant aromatic odor, and acid taste. Sparingly soluble in water, but is easily dissolved in alcohol. When heated, is completely evaporated, with an agreeable and peculiar odor; but if the temperature is raised too high, it takes fire, and burns with a yellow flame.

(b) *Therapeutical effects.* Stimulant and expectorant.

(c) *Used* in chronic bronchitis.

(d) *Dose.* Five grains to half a drachm twice a day.

Acid, Carbolic (*pure and impure*). A powerful antiseptic substance, obtained from coal tar oil.

(a) *Physical properties.* The *pure* anhydrous acid is in long, colorless, prismatic crystals, turning a pale pink on keeping. It rapidly deliquesces in moist air. The *impure* is a more or less brown liquid. Both strongly resemble tar in smell.

(b) *Therapeutical effects.* Strongly antiseptic, antifermentative, and caustic.

(c) The pure acid is applied on cotton for allaying tenderness and pain in decayed teeth. Being a caustic, it should be carefully kept from touching anything but the tooth; when properly used, it is the best application for toothache arising from this cause, and is indeed a specific.

Dose. About a grain of the acid is enough for toothache. One drachm of carbolic acid to a pint of water is strong enough for disinfectant purposes.

Acid, Citric, prepared from the juice of lemons.

(a) *Physical properties.* Sharp acid taste, white semi-transparent crystals of a rhomboidal shape. Decomposed by heat; soluble in twice their weight of cold, and half their weight of boiling water.

(b) *Therapeutical effects.* Refrigerant.

(c) *Used* in febrile and inflammatory complaints; dissolved in water as a substitute for lemon juice, and added to soda to form the common effervescing draught.

(d) *Dose.* 10 grains to 1 scruple; 15 grains of the acid neutralize 20 grains of bicarbonate of soda, to form the effervescing draught.

Acid, Gallic, prepared from galls.

(a) *Physical properties.* A powder of nearly colorless semi-crystalline appearance; dissipated by heat; dissolves in water and spirit.

(c) *Used* in discharges of blood and diarrhoea, and in other mucous discharges. Also in hemorrhoids.

(d) *Dose.* 2 to 5 grains. As an injection half a drachm dissolved in one ounce of water; an ointment, 20 grains are mixed with an ounce of lard, with the addition of 30 or 40 grains of powdered opium.

Acid, Hydrochloric (*diluted*). Hydrochloric acid, mixed with three times its bulk of water.

(a) *Physical properties.* Taste, intensely acid and caustic; smell, acid and suffocating;

the acid is colorless when pure, but usually is of a straw color, with the presence of peroxide of iron, or nitrous acid.

(b) *Therapeutical effects.* Tonic, antiseptic, and partially diuretic, by promoting all the secretions.

(c) *Used*, when combined with diluted nitric acid, in affections of the liver; also with bitters, to prevent the generation of worms; in gargles for sore throat.

(d) *Dose.* 20 minims to 40.

Acid, Sulphuric (*diluted*). Sulphuric acid mixed with about eleven times its bulk of water.

(a) *Physical properties.* Strong acid taste, inodorous, colorless, and transparent. Specific gravity, 1.103.

(b) *Therapeutical effects.* Tonic, astringent, and antiseptic.

(c) *Used* in dyspepsia, also to check sweatings, salivation, and diarrhoea; likewise as a gargle.

(d) *Dose.* 10 minims to 30, diluted largely (2 drachms to 8 ounces) as a gargle, with honey, sage, etc.

Acid, Tartaric.

(a) *Physical properties.* Colorless imperfect crystals, inodorous, very acid, soluble, largely in water.

(b) *Therapeutical effects.* Refrigerant, antiseptic, diuretic, and slightly aperient.

(c) *Used* in fevers, etc., with some soda or potassium, as an effervescing draught, instead of citric acid; the proportions being the same.

Æther, Sulphuric.

(c) *Physical properties.* A limpid, volatile, inflammable fluid, without color, produces great cold by evaporation; taste, peculiar, but hot and pungent; sparingly soluble in water, readily so in alcohol.

(b) *Therapeutical effects.* A diffusible stimulant, afterwards narcotic and antispasmodic; externally cooling; when inhaled producing anæsthesia.

(c) *Used* in hysteria, faintings, asthma, and other spasmodic complaints.

(d) *Dose.* 20 minims to 60, in water.

Aloes, Barbadoes.—The inspissated juice, of the cut leaf of the *Aloe spicata*, imported from the Cape of Good Hope and West Indies.

(a) *Physical properties.* Of a dark brown color, and shining resinous surface, with a strong disagreeable odor, and very bitter taste; very difficult to powder, and soluble in diluted alcohol.

(b) *Therapeutical effects.* A stimulating purgative, producing its chief effects on the lower bowels. Apt to produce and aggravate hemorrhoids.

(e) *Used in dyspepsia and in head affections; also as a common purgative.*

(d) *Dose.* One fourth of a grain to 5 grains, well powdered, or dissolved in hot water.

Alum.

(a) *Physical properties.* A semi-transparent, rough, irregular mass of saline matter. Taste, acid-astringent. Soluble in 18 parts of water at 60 degrees, and in a little more than an equal weight of water at 212 degrees.

(b) *Therapeutical effects.* Astringent and styptic.

(c) *Used internally in hemorrhages; externally in ophthalmia, or as a gargle.*

(d) *Dose.* 10 grains to 20. As gargle—1 drachm to a pint of water.

Ammonia, Liquor of. Ammonia condensed in water.

(a) *Physical Properties.* A stimulating solution. Blisters the skin.

(b) *Therapeutical effects.* Stimulating, diaphoretic, anti-acid, when given internally. Externally, irritant and eschiorotic.

(c) *Used,* when largely diluted, in faintings, asphyxia, hysteria, spasms, acidities of the stomach; and, externally, as an irritant of the skin.

(d) *Dose.* The aromatic spirits of ammonia is the usual form for internal use. Dose from 15 to 40 minims.

Ammonia, Sesqui-Carbonate of. Ammonia united with carbonic acid.

(a) *Physical properties.* A mass of irregular crystals, somewhat resembling white sugar, but more transparent and striated. Smell, pungent; taste, sharp and alkaline; soluble in four times its weight of cold water; becomes opaque and friable on exposure to the air.

(b) *Therapeutical effects.* Stimulating, anti-spasmodic, diaphoretic, and anti-acid.

(c) *Used in dyspepsia, hysteria, and all diseases requiring a rapidly acting diffusible stimulant.* Externally, to the nostrils in syncope.

(d) *Dose.* 2 grains to 5, in pills or dissolved in any fluid.

Antimony, Potassio-Tartrate of. Tartar emetic.

(a) *Physical properties.* A colorless, transparent, inodorous, crystallized salt, with a slightly metallic taste. Soluble in fifteen times its weight of cold water, and twice its weight of boiling water; insoluble in pure alcohol, but soluble in proof spirit or wine. The aqueous solution becomes decomposed by keeping.

(b) *Therapeutical effects.* Emetic in large doses; diaphoretic in small ones; expectorant, slightly aperient and alterative; externally applied, produces a crop of pustules.

(c) *Used to evacuate the stomach, to slow the circulation, and to produce profuse perspiration.* Externally applied in the form of an ointment, to produce counter-irritation.

(d) *Dose.* As an emetic, 1 grain to 4 grains in solution; in pneumonia, 1-2 a grain to 3 grains, often repeated; as an expectorant, or diaphoretic, 1-8 of a grain to 1-2 a grain.

Asafoetida, Gum.

(a) *Physical properties.* A mass of irregular pieces, varying in color from red or reddish-brown to white; odor resembling garlic, but more fetid; taste, bitter and slightly acid; difficult to powder, unless rubbed with carbonate of ammonia. Forms a milky mixture with water.

(b) *Therapeutical effects.* Antispasmodic, expectorant, anthelmintic.

(c) *Used in hysteria, flatulence, colic, etc.*

(d) *Dose.* 5 to 10 grains.

Bismuth, Trisnitate of. The metal bismuth united with nitric acid.

(a) *Physical properties.* A white, tasteless, inodorous powder, very slightly soluble in water.

(b) *Therapeutical effects.* Antispasmodic, stomachic, and tonic.

(c) *Used much in dyspepsia, attended with pain of the stomach, and water brash, and diarrhoea.*

(d) *Dose.* 5 to 10 grains.

Borax. Biborate of soda.

(a) *Physical properties.* Sweetish, shining, efflorescent crystals, soluble in twelve parts of cold and two parts of boiling water.

(b) *Therapeutical effects.* Absorbent, cooling, and alterative.

(c) *Used in intestinal irritation of infants.* Externally applied to thrush, and to cutaneous diseases.

(d) *Dose.* 5 grains to 30. Externally applied, dissolved in eight times its weight of honey, or mucilage, or, better, in pure water.

Calomel. See MERCURY.

Camphor. A peculiar substance, obtained by distillation from the wood of the *Laurus camphor*.

(a) *Physical properties.* In large, white semi-transparent cakes, with a strong peculiarly fragrant and aromatic odor; taste, bitter and acid; insoluble in water; soluble in alcohol, ether, acetic acid, and the fixed oils.

(b) *Therapeutical effects.* Stimulant, diaphoretic, sedative; externally, soothing.

(c) *Used in hysteria, asthma, chorea, and generally in spasmodic diseases.* Externally, in muscular pains, bruises, etc.

(d) *Dose.* 8 grains to 5, in pills. When dissolved in water as camphor mixture, the quantity is scarcely appreciable.

Cantharides, Plaster of. Blistering plaster. Sometimes prepared in the form of a tissue paper, imbued with the active principle.

(a) *Physical properties.* The plaster is a firm preparation requiring the warmth of the hand to enable it to be spread upon leather or calico. It soon spoils by keeping; and if more than a month old should, after spreading, be dusted over with powdered cantharides.

(b) *Therapeutical effects.* To raise the cuticle from the cutis, producing at the same time a large secretion of serous fluid. The time varies from 3 hours to 12, or even more. In babies the blister should always be carefully watched after 3 hours, as it often rises rapidly and would be liable to produce severe ulceration of the skin. Blistering may be promoted by applying a poultice after the removal of the cantharides.

Capsicum.

(a) *Physical Properties.* Berries of a red color, and an extremely pungent odor and taste, which is yielded to alcohol, ether, vinegar, and water.

(b) *Therapeutical effects.* Stimulant, stomachic, and rubefacient.

(c) *Used* in dyspepsia, flatulence; externally, as an ingredient in gargles for relaxed sore throat.

(d) *Dose.* 3 grains to 5 grains, in pills; 2 drachms to 8 ounces form the strength for using as a gargle diluted largely with water.

Castor Oil, obtained from *Ricinus communis*.

(a) *Physical properties.* A pale yellow-colored, transparent and viscid oil, with a faint odor and nauseous taste.

(b) *Therapeutical effects.* Mildly aperient.

(c) *Used* in colic and in those cases of constipation which will not bear drastic purgatives; also for mixing with gruel for the ordinary enema.

(d) *Dose.* A teaspoonful to one or two tablespoonfuls; an ounce is the proper quantity for mixing with gruel to make an enema.

Cerate. A species of ointment made rather hard with wax.

(a) **Simple Cerate.** Add 20 ounces of melted wax to a pint of olive oil, and mix while warm, stirring till cold.

(b) **Cerate of Spermaceti.** Melt together eight ounces of white wax and ten of spermaceti; then add a pint of olive oil, and stir together till they cool.

(c) **Cerate of Acetate of Lead.** Melt four ounces of white wax in eight fluid ounces of olive oil; then gradually add four drachms of powdered acetate of lead, previously rubbed with two fluid ounces of olive oil, and stir with a spatula till they unite.

(d) **Cerate of Resin.** Mix together 15 ounces each of resin and wax, and melt them over a slow fire; then add a pint of olive oil, and press the cerate, while hot, through a linen cloth.

Chalk, prepared. Friable carbonate of lime, rubbed into a fine powder and washed.

(a) *Physical properties.* An inodorous, insipid, white, friable powder, heavy, and insoluble in water.

(b) *Therapeutical effects.* Anti-acid, astringent, and absorbent.

(c) *Used* in acidities of the stomach and bowels, and to correct the irritation which is established in diarrhoea. Externally as a mild application of sores and burns.

(d) *Dose.* 10 to 15 grains.

Chamomile Flowers.

(a) *Physical properties.*

The flowers are small, with a strong, fragrant odor, and bitter aromatic taste, and some slight degree of warmth. Water and alcohol both absorb the virtues of this plant.

(b) *Therapeutical effects.* Tonic, stomachic, and carminative. The warm infusion, when weak, is emetic. Externally soothing.

(c) *Used* in dyspepsia, hysteria, flatulence, and also to work off emetics.

(d) *Dose* of the powder. 30 to 40 grains twice a day. The infusion—a half ounce to a pint of water—is usually preferred.

Chloride of Zinc. A combination of Zinc with chlorine.

(a) *Physical properties.* In solid piece, snow-white, inodorous, having a strongly styptic and metallic taste.

(b) Powerfully caustic, destroying the vitality of the part with which it is in contact, and causing very severe pain. In solution it is used as a disinfectant, appearing to act more energetically than chlorinated soda or lime, with a less disagreeable odor of chlorine.

(c) *Used* as a caustic in cancer and fungoid disease. In solution, it is applied to cutaneous diseases, and to mucous membranes, but requires great caution in its use. As a disinfectant, it must be largely diluted. (See DISINFECTANTS.)

Cincona Bark (yellow).

(a) *Physical properties.* Larger, thicker, and less rolled than the pale bark. Externally of a brownish yellow, and internally of a cinnamon brown. The fracture is fibrous; taste bitter, and less aromatic than the pale, with scarcely any degree of astringency.

(b) *Therapeutical effects.* Astringent, tonic, antiseptic, and febrifuge.

(c) *Used* in typhoid fevers, and in all low states of the system, being in such cases superior to quinine.

(d) *Dose.* 10 grains to 50, in wine or wine and water.

Cinnamon. Bark, oil, and water, used as a warm and cordial spice to prevent the griping of purgatives, etc.

Cod-Liver Oil. Prepared from the liver of the codfish.

(a) *Physical properties.* An oil of three different colors: pale yellow, pale brown, and dark brown. The pale brown appears to possess the highest virtues.

(b) *Therapeutical effects.* Nutritive and acting also on the general system.

(c) *Used* largely in consumption and chronic bronchitis to diminish the secretion from the lungs, and arrest, to some extent, the waste incident to these diseases; in nervous affections as a nerve-food, and in some skin diseases; also in other exhausting diseases.

(d) *Dose.* One drachm carried up to 4 in any convenient vehicle, as infusion of cloves.

Colocynth. The peeled fruit of the bitter cucumber.

(a) *Physical properties.* A white, soft, porous, medullary substance, investing the seeds with an intensely bitter, acrid, and nauseous taste.

(b) *Therapeutical effects.* Powerfully aperient.

(c) *Used,* with warm cordial spices, as an ordinary aperient. (*See EXTRACTS.*)

(d) *Dose.* 5 to 10 grains.

Conium (Hemlock). The leaves of *Conium maculatum*, an indigenous plant.

(a) *Physical properties.* Has a heavy narcotic smell, with a bitter, nauseous, and herbaceous taste; color, dull green; powers soon destroyed by light. Should be gathered just as the plant comes into flower, and dried in the sun, or in a stove.

(b) *Therapeutical effects.* Sedative, narcotic—in some cases alterative, and even tonic.

(c) *Used* in scirrhus and cancerous affections externally, and internally for neuralgia and pulmonary complaints; also in scrofulous complaints of children, especially in ophthalmia—in all cases requiring great caution; externally as a poultice, made by scalding the fresh leaves.

(d) *Dose.* 2 to 3 or 4 grains.

Copaiba Balsam.

(a) *Physical properties.* A liquid of a transparent yellowish color, and peculiar smell and taste, which is pungent, acrid, and nauseous; when fresh, of the consistency of linseed oil, gradually becoming thicker by exposure to the air, till at last it is as solid as resin; soluble in ether and alcohol.

(b) *Therapeutical effects.* Stimulant, diuretic, purgative in large doses; allays irritation of

the mucous membranes, and especially those of the urinary passages.

(c) *Used* in chronic bronchitis, spasmodic asthma, whooping-cough, and in chronic inflammation of the bladder, etc.

(d) *Dose.* 10 minims to 30 in emulsion, or in the gelatine capsules in which it is sold.

Creosote. A peculiar liquid prepared from pyroxylic oil.

(a) *Physical properties.* An oily, colorless, transparent fluid, with a disagreeable smell, resembling somewhat the odor of badly-smoked meat.

(b) *Therapeutical effects.* Tonic, stomachic, diaphoretic, antiseptic, and styptic.

(c) *Used* internally in phthisis; also in troublesome vomiting, from any cause not readily understood, as seasickness.

Decoction of Cinchona.

(a) Boil 10 drachms of bruised yellow cinchona in a pint of water for ten minutes, in a closed vessel, then strain.

(b) *Therapeutical effects.* Antiseptic, astringent, tonic, febrifuge.

(c) *Used* in fever, malignant sore throat, dyspepsia.

(d) *Dose.* 1½ to 3 ounces twice or thrice a day.

Decoction of Dandelion.

(a) Boil 4 ounces of bruised dandelion in 1½ pints of distilled water to a pint, and strain.

(b) *Therapeutical effects.* Diuretic, slightly aperient, and specially acting on the liver.

(c) *Used* in torpid conditions of the liver, jaundice, habitual constipation, etc.

(d) *Dose.* 2 or 3 ounces twice or thrice a day.

Decoction of Iceland Moss.

(a) Boil 5 drachms of Iceland moss in a pint and a half of water down to a pint, and strain.

(b) *Therapeutical effects.* Tonic, emollient, slightly astringent.

(c) *Used* in consumption and dysentery.

(d) *Dose.* 1 to 2 ounces.

Decoction of Logwood.

(a) Boil 10 drachms of sliced logwood in 1½ pints of water to a pint, and strain.

(b) *Therapeutical effects.* Astringent and tonic.

(c) *Used* in diarrhoea and dysentery.

(d) *Dose.* 1 ounce to 2 ounces after each action of the bowels.

Decoction of Poppyheads.

(a) Boil five ounces of bruised poppyheads in 3 pints of water for a quarter of an hour, and strain.

(b) *Therapeutical effects.* Anodyne and soothing.

(c) *Used* as a fomentation in painful swellings and inflammation.

Decoction of Sarsaparilla (simple).

(a) Boil four ounces of sarsaparilla in 4 pints of water to 2 pints, and strain.

(b) *Therapeutical effects.* Alterative, diaphoretic, and tonic.

(c) *Used* in cutaneous diseases, chronic rheumatism, and scrofula.

(d) *Dose.* 2 ounces, twice or thrice a day.

Decoction of Sarsaparilla (compound).

(a) Mix 4 pints of boiling decoction of sarsaparilla, 10 drachms of sliced sassafras, 10 drachms of guaiacum-wood shavings, 10 drachms of bruised stick-liquorice, and 3 drachms of mezereon bark; boil for a quarter of an hour, and strain.

(b) (c) (d) *Therapeutical effects.* The same as the last, but warmer, and therefore better suited to weak stomachs.

Dill Water. Prepared from Dill seeds by distillation.

(a) *Physical properties.* An aromatic odor, with a pungent agreeable taste.

(b) *Therapeutical effects.* Carminative and stimulative.

(c) *Used* in the flatulence and gripings of children.

(d) *Dose.* $\frac{1}{2}$ drachm to 1 $\frac{1}{2}$ ounce.

Extract of Gentian.

(a) Made from the gentian root.

(b) *Therapeutical effects.* Tonic and stomachic.

(c) *Used* in dyspepsia.

(d) *Dose.* 5 to 20 grains.

Extract of Henbane. Prepared from the leaves of *Hyoscyamus niger*.

(a) *Physical properties.* An extract of a dingy olive color, and a peculiar disagreeable smell; taste, bitterish and saline.

(b) *Therapeutical effects.* Narcotic, anodyne, and antispasmodic.

(c) *Used* instead of opium, in irritability of the nervous system, or mucous surfaces, or in combination with purgatives to prevent their griping, as it does not cause constipation.

(d) *Dose.* 5 to 8 grains.

Extract of Hop.

(a) *Physical properties.* A dark-colored bitter extract, without much smell.

(b) *Therapeutical effects.* Tonic and sedative.

(c) *Used* in chronic dyspepsia and loss of sleep.

(d) *Dose.* 10 to 15 grains.

Extract of Sarsaparilla (liquid). Prepared from sarsaparilla, and used for the same purposes as the decoction. It is sold both as a simple and compound extract.

(a) *Dose.* 30 drops to 1 drachm two or three times a day in water.

Gamboge. A gum resin, of a purgative nature, but too powerful for domestic use.

Horseradish (the fresh root).

(a) *Physical properties.* Pungent odor, biting, acrid taste; communicates its active principles partially to water, but completely to alcohol.

(b) *Therapeutical effects.* Stimulant, diuretic, sudorific, emetic.

(c) *Used* in paralytic affections and chronic rheumatism.

(d) *Dose.* 1 to 2 drachms, cut into small pieces, or made into an infusion.

Infusion of Chamomile.

Chamomile tea.

(a) Macerate 5 drachms of chamomile flowers in a pint of boiling distilled water for ten minutes, in a closed vessel, and strain.

(b) *Therapeutical effects.* Tonic, stomachic; emetic, when warm. Externally soothing.

(c) *Used* in dyspepsia, and to assist the operation of emetics.

(d) *Dose.* 1 to 2 ounces. For emetic purposes, a weaker infusion is used in large quantities.

Infusion of Cloves.

(a) Macerate 3 drachms of bruised cloves in a pint of boiling water, in a covered vessel, and strain.

(b) *Therapeutical effects.* Stimulant, stomachic, slightly tonic.

(c) *Used* as a vehicle for more active tonics, especially cod-liver oil.

(d) *Dose.* 1 ounce to 2 or 3.

Infusion of Gentian (compound).

(a) Macerate 2 drachms of sliced gentian, 2 drachms of dried orange-peel, and 4 drachms of lemon peel in a pint of boiling water for an hour, in a covered vessel, and strain.

(b) *Therapeutical effects.* Stomachic and tonic.

(c) *Used* in dyspepsia and general debility.

(d) *Dose.* 1 $\frac{1}{2}$ to 2 ounces two or three times a day.

Infusion of Linseed (compound).

Linseed tea.

(a) Macerate 6 drachms of bruised linseed and 10 drachms of sliced fresh liquorice in a pint of boiling water, for four hours, near the fire, in a covered vessel, and strain.

(b) *Therapeutical effects.* Soothing, especially to the mucous passages.

(c) *Used* in chronic bronchitis and strangury.

(d) *Dose, ad libitum.*

Infusion of Orange-peel (compound).

(a) Macerate half an ounce of dried orange-peel, two drachms of lemon-peel, one drachm of cloves bruised, in a pint of boiling water, for a quarter of an hour, in a covered vessel, and strain.

(b) *Therapeutical effects.* Stimulant, stomachic, and tonic.

(c) *Used in dyspepsia, and as a vehicle for other remedies.*

(d) *Dose.* 1 ounce to 2 or 3, at short intervals.

Infusion of Quassia.

(a) *Macerate* 10 scruples of quassia sliced, in a pint of boiling water for two hours, in a covered vessel.

(b) *Therapeutical effects.* Tonic and stomachic.

(c) *Used in dyspepsia.*

(d) *Dose.* $1\frac{1}{2}$ to 2 ounces.

Infusion of Rhubarb.

(a) *Macerate* 8 drachms of sliced rhubarb root in a pint of boiling water for two hours, in a covered vessel, and strain.

(b) *Therapeutical effects.* Stomachic, tonic, and aperient.

(c) *Used in dyspepsia accompanied with constipation, especially in combination with gentian.*

(d) *Dose.* $\frac{1}{2}$ half ounce to $1\frac{1}{2}$ ounces.

Infusion of Roses (compound).

(a) Put three drachms of the dried red rose leaves into a pint of boiling water, then add a fluid drachm and a half of diluted sulphuric acid. *Macerate* for two hours, and strain the liquor; lastly, add 6 drachms of sugar.

(b) *Therapeutical effects.* Astringent, refrigerant, and antiseptic.

(c) *Used as a drink in fevers; also as a vehicle for sulphate of magnesia, quinine, etc.*

(d) *Dose.* $1\frac{1}{2}$ to 2 ounces.

Infusion of Senna (compound).

Senna tea.

(a) *Macerate* 15 drachms of senna leaves, and four scruples of bruised ginger in a pint of boiling water for an hour in a closed vessel, and strain.

(b) *Therapeutical effects.* Aperient.

(c) *Used as a vehicle for more active purgatives, which it assists; or by itself as a mild purgative.*

(d) *Dose.* 1 to 3 ounces.

Ipecacuanha, the root.

(a) *Physical properties.* In pieces of three or four inches in length, with a resinous fracture; an acrid, aromatic somewhat bitter taste, slightly nauseous; peculiar odor; yields its active principle to water, spirit, and wine.

(b) *Therapeutical effects.* Emetic, diaphoretic, expectorant, and acting peculiarly on the liver.

(c) *Used as an emetic; also as an expectorant in bronchitis, asthma, etc., as a nauseate in pneumonia, diarrhoea, dysentery; as a diaphoretic in various diseases, and in torpid liver, to promote its proper secretions.*

(d) *Dose.* As an emetic, 15 to 30 grains; as a nauseate, 2 to 4 grains; as a diaphoretic,

1 grain, with a small dose of opium; as an expectorant or for torpid liver, $\frac{1}{2}$ to 1 grain.

Jalap, the Root.

(a) *Physical properties.* Thin, transverse slices, or round masses; solid, hard, and heavy; dark gray color, striated appearance; sickly smell; taste sweetish but nauseous.

(b) *Therapeutical effects.* Actively aperient.

(c) *Used in obstinate constipation, worms, dropsy; requires a carminative to prevent griping and nausea.*

(d) *Dose.* 10 grains to 30.

Laudanum. (See OPIUM.)

Liniment of Ammonia.

(a) To 1 fluid ounce of the solution of ammonia add 2 fluid ounces of olive oil and shake together.

(b) *Therapeutical effects.* Stimulant and rubefacient.

(c) *Used in sore throat externally, also in chronic rheumatism, with friction.*

Liniment of Camphor.

(a) Dissolve 1 ounce of camphor in 4 fluid ounces of olive oil.

(b) *Therapeutical effects.* Stimulant.

(c) *Used in chronic rheumatism, with friction.*

Liniment of Camphor (Compound).

(a) Dissolve $2\frac{1}{2}$ ounces of camphor and 1 drachm of oil of lavender in 17 fluid ounces of rectified spirits of wine; then add 3 fluid ounces of the strong solution of ammonia, and shake well together.

(b) *Therapeutical effects.* Stimulant.

(c) *Used with friction in the same way as the simple liniment, but it is more powerful.*

Liniment of Turpentine.

(a) Shake well together 2 ounces of soft soap and an ounce of camphor, with 16 fluid ounces of the spirit of turpentine, until mixed.

(b) *Therapeutical effects.* Stimulant.

(c) *Used in paralytic affections and chronic rheumatism; also to burns and scalds.*

Liquor of Acetate of Lead. Sold by the druggists.

(a) *Therapeutical effects.* Sedative and astringent when applied externally.

(b) *Used as a lotion to inflamed surfaces when largely diluted with water.* Goulard water is prepared from it by adding a fluid drachm and a half of it and 2 fluid drachms of proof spirit to a pint of distilled water.

Magnesia, Carbonate of.

(a) *Physical properties.* A solid, white, tasteless, inodorous powder, insoluble in water.

(b) *Therapeutical effects.* Anti-acid and purgative.

(c) *Used in dyspepsia with costiveness, in the constipation of children and delicate grown persons*

(d) *Dose.* $\frac{1}{2}$ drachm to 1 drachm or 2.

Magnesia, Sulphate of. Epsom salts.

(a) *Physical properties.* Small, pointed crystals of a transparent, colorless appearance; inodorous, with a disagreeable bitter taste; dissolves readily in water.

(b) *Therapeutical effects.* Purgative.

(c) *Used* as a cooling laxative, washing the bowels out, but not searching them.

(d) *Dose.* 1 drachm to 1 ounce.

Marsh Mallows.

(a) *Physical properties.* A root; long cylindrical; grayish without, white within; inodorous; taste sweetish.

(b) *Therapeutical effects.* Soothing.

(c) *Used* to make a soothing drink in irritation of the mucous membranes, or as a fomentation; boiling the leaves and roots to form it.

Mercury, Ammonia-chloride of.

White precipitate.

(a) *Physical properties.* A white, inodorous powder; insipid, insoluble in water and alcohol.

(b) *Therapeutical effects.* Used externally only; it is detergent.

(c) *Used* for cutaneous diseases and for destroying lice, etc., in its powdered condition.

Mercury, Mild Chloride of. Calomel.

(a) *Physical properties.* A white, semi-transparent crystalline mass, inodorous, insipid, and insoluble. Usually sold as a heavy white powder.

(b) *Therapeutical effects.* Alterative, purgative, and producing absorption.

(c) *Used* in chronic diseases of the liver and general torpidity of the stomach and bowels; in dropsy, in combination with other medicines. A most dangerous medicine when employed by those who are not aware of its powerful effects.

(d) *Dose.* 1 grain twice a day as an alterative, 4 to 5 grains as an aperient, combined with, or followed by, some mild vegetable purgative.

Mercury, Nitric Oxide of. Red precipitate.

(a) *Physical properties.* A powder of a brilliant red color, insoluble in water.

(b) *Therapeutical effects.* Stimulant, external.

(c) *Used* in old ulcers and to heal indolent sores of all kinds when made into an ointment with lard. (See Ointments.)

Mint-water. Prepared from peppermint or spearmint. These are sold in the shops.

(a) *Therapeutical effects.* Both are carminative and slightly stimulating. Spearmint water is also diuretic.

(b) *Used* as a vehicle for other remedies.

Mixture of Chalk.

(a) Rub $\frac{1}{2}$ ounce of prepared chalk and 8 drachms of sugar with a fluid ounce and a half

of mixture of acacia and 8 fluid ounces of cinnamon water.

(b) *Therapeutical effects.* Anti-acid, absorbent, and astringent when given in diarrhoea.

(c) *Used* in diarrhoea.

(d) *Dose.* A tablespoonful every two hours.

Mixture of Iron (compound).

(a) Rub 2 drachms of powdered myrrh and 1 drachm of carbonate of potassium with a fluid ounce of spirit of nutmeg; to these, while rubbing, add 18 fluid ounces of rose-water, 2 drachms of sugar, and $2\frac{1}{2}$ scruples of powdered sulphate of iron. Put the mixture in a well-stoppered bottle.

(b) *Therapeutical effects.* Stomachic, astringent, tonic, emmenagogue.

(c) *Used* in chlorotic girls, and in all the defective secretions of young females.

(d) *Dose.* 1 to $1\frac{1}{2}$ ounce.

Ointment of Creosote.

(a) Rub half a fluid drachm of creosote with an ounce of lard, until they are incorporated.

(b) *Therapeutical effects.* Stimulant.

(c) *Used* in scald head, etc.

Ointment of Galls (compound).

(a) Mix 6 drachms of finely powdered galls, 6 ounces of lard, and $1\frac{1}{2}$ drachm of powdered opium.

(b) Astringent and anodyne.

(c) *Used* for hemorrhoids; but one quarter of the quantity of gallic acid answers much better.

Ointment of Green Iodide of Mercury.

(a) Mix from 80 grains to 1 drachm of green iodide of mercury with 1 ounce of lard.

(b) *Used* in scald head, for which it is very efficacious.

Ointment of Nitric Oxide of Mercury.

(a) Rub 1 ounce of finely powdered nitric oxide of mercury with 10 ounces of wax, and 6 ounces of lard.

(b) *Therapeutical effects.* Stimulant.

(c) *Used* in indolent ulcers.

Ointment of Zinc.

(a) Mix 1 drachm of oxide of zinc with 6 drachms of lard.

(b) *Used* as a cooling, astringent, and drying ointment.

Olive Oil.

(a) *Physical properties.* A transparent fixed oil, of a yellowish color; inodorous and without much taste.

(b) *Therapeutical effects.* Soothing, and slightly aperient.

(c) *Used* in bronchial irritation; also as a vehicle for other medicines in the form of liniment.

(d) *Dose.* 1 to 2 drachms.

Peruvian Balsam.

(a) *Physical properties.* Of the consistence of honey; color, brown; agreeable smell, and hot, acid taste.

(b) *Therapeutical effects.* Stimulant, expectorant; externally applied to indolent ulcers.

(c) *Used* in catarrh and chronic rheumatism.

(d) *Dose.* 15 minims to half a drachm.

Pill of Mercury. Blue pill.

(a) The metal partially oxidated, and mixed with confection of roses.

(b) *Therapeutical effects.* Alterative and purgative, especially on the liver.

(c) *Used* in dyspepsia, torpidity of the liver, and constipation.

(d) *Dose.* 1 to 5 or 6 grains.

Pill of Rhubarb (compound).

(a) Made up of rhubarb, aloes, and myrrh.

(b) *Therapeutical effects.* Laxative.

(c) *Used* in dyspepsia and constipation.

(d) *Dose.* Two at bedtime.

Pitch, Burgundy. The impure resin of the Norway spruce fir.

(a) *Physical properties.* A tenacious mass, of fragrant odor, semi-transparent, and unctuous.

(b) *Therapeutical effects.* Stimulant and rubefacient.

(c) *Used* externally in the form of a plaster in bronchitis, whooping cough, etc.

Poultice of Charcoal.

(a) Macerate for a short time before the fire 2 ounces of bread in 2 fluid ounces of boiling water; then mix and gradually stir in 10 drachms of linseed meal; with these mix 2 drachms of powdered charcoal, and sprinkle a drachm on the surface.

(b) *Antiseptic and digestive.*

(c) *Used* in gangrene.

Poultice of Hemlock.

(a) Make a poultice of linseed meal; then add 1 ounce of extract of hemlock previously softened with water, or 4 ounces of the fresh leaves scalded and bruised.

(b) *Therapeutical effects.* Anodyne and discutient.

(c) *Used* in glandular swellings and cancerous sores.

Poultice of Linseed.

(a) Put into a basin enough meal to form a poultice, making a hole in its center; then pour upon it boiling water to fill that hole, and stir rapidly with a kitchen knife. This will generally be sufficient to make the poultice of the proper consistency. It is always better to add enough water at first, as it is not so smooth if added piecemeal.

(b) *Therapeutical effects.* Stimulant, and yet soothing.

(c) *Used* for abscesses and ulcers when inflamed.

Poultice of Mustard.

(a) Make either a bread or a linseed-meal poultice, then sprinkle over it enough flour of mustard to conceal its surface, and wet it with a little boiling water. Some people add hot vinegar to wet it with.

(b) *Therapeutical effects.* Stimulant, and often inclined to blister the skin.

(c) *Used* as a rapid counter-irritant.

Poultice of Yeast.

(a) Mix 5 ounces of yeast with an equal quantity of water, at 100 degrees; with these stir up a pound of flour, so as to make a poultice; place it by the fire till it swells, and use.

(b) Stimulant, emollient.

(c) *Used* for indolent abscesses and sores.

Powder of Ipecacuanha (compound). Dover's powder.

(a) *Physical properties.* Compound of opium, ipecacuanha, and sulphate of potassium.

(b) *Therapeutical effects.* Diaphoretic, anodyne, and narcotic.

(c) *Used* to produce perspiration in rheumatism and dysentery, etc.

(d) *Dose.* 5 to 10 grains.

Quinine, Sulphate of.

(a) *Physical properties.* Colorless, inodorous, lustrous, bitter efflorescent crystals, totally soluble in water previously acidulated with sulphuric acid.

(b) *Therapeutical effects.* Stomachic, stimulant, febrifuge, and tonic.

(c) *Used* in general debility, neuralgia, and after fever.

(d) *Dose.* 1 to 3 grains.

Rhubarb.—The root, whole and powdered.

(a) *Physical properties.* The root is in firm, flattish, irregular pieces, occasionally pierced with large holes; color, bright yellow, externally; odor, peculiar and aromatic; taste, bitter, astringent, and somewhat nauseous; imparts its virtue to water and alcohol. The powder is of a reddish yellow.

(b) *Therapeutical effects.* Purgative and stomachic; acting on the small bowels.

(c) *Used* as a mild purgative in the constipation of children and adults.

(d) *Dose.* 10 to 30 grains.

Saffron.

(a) A coloring matter obtained from the *Crocus sativus*.

Senna.—The leaves.

(a) *Physical properties.* Leaves of a pale green color; leaflets broad, lanceolate; the two sides unequal; odor faint, somewhat like green tea; taste, nauseous and bitter. Yields its properties to spirit and water.

(b) *Therapeutical effects.* Cathartic.

(c) *Used in constipation, and to lower the system. Made into the infusion.*

(d) *Dose.* 5 grains to 25, rubbed down with ginger and sugar.

Soda, Bicarbonate of.

(a) *Physical properties.* A heavy white powder, without smell, and tasting slightly soapy. Entirely soluble in water.

(b) *Therapeutical effects.* Anti-acid.

(c) *Used in the manufacture of effervescing draughts, and for acidities of the stomach.*

(d) *Dose.* 5 to 30 grains.

Soda, Sulphate of.—Glauber's salts.

(a) *Physical properties.* Crystals, of an exceedingly bitter taste, and without smell. Soluble in water.

(b) *Therapeutical effects.* Purgative and diuretic.

(c) *Used in costiveness.*

(d) *Dose.* $\frac{1}{2}$ to 1 ounce.

Spirit of Ammonia (aromatic).

(a) *Physical properties.* A compound, containing carbonate of ammonia and aromatics, with spirit; and possessing an aromatic, warm, and alkaline taste. Miscible with water, which it renders milky.

(b) *Therapeutical effects.* Stimulant and cordial.

(c) *Used as the ordinary diffusible stimulus in faintings and hysteria; also added to senna to prevent griping.*

(d) *Dose.* 30 to 60 drops.

Spirit of Ammonia (fetid).

(a) *Physical properties.* The same as the above, with the addition of asafoetida.

(b) *Therapeutical effects.* Stimulant and antispasmodic.

(c) *Used in hysterical fits.*

(d) *Dose.* 30 to 60 drops.

Spirit of Horse-radish (compound).

(a) Mix 20 ounces of sliced horse-radish, 20 ounces of dried orange peel, 5 drachms of bruised nutmegs, and a gallon of rectified spirit with 10 pints of water; then distill to a gallon, with a slow fire.

(b) *Therapeutical effects.* Stimulant, diaphoretic and diuretic.

(c) *Used internally in dyspepsia, and in paralysis, externally rubbed into the skin.*

(d) *Dose.* 1 to 2 drachms.

Spirit of Nitric Ether. Sweet spirits of niter.

(a) *Physical properties.* A colorless, transparent, volatile, inflammable fluid, of an ethereal odor.

(b) *Therapeutical effects.* Cooling, diuretic, and diaphoretic; also slightly antispasmodic.

(c) *Used in febrile diseases, dropsy, and spasm.*

(d) *Dose.* 20 to 60 minims, largely diluted.

Squill.—The sea onion.

(a) A root of a pear shape, covered with several thin dry tissues, under which are oval, flaky, red or white scales; odor, pungent; taste, acrid and bitter. Imparts its virtue to vinegar, spirits, and water.

(b) *Therapeutical effects.* Expectorant, emetic, diuretic.

(c) *Used in chronic bronchitis and asthma.*

(d) *Dose.* 2 to 6 grains. Syrup of squills, dose, 1 to 1½ drachms.

Syrup of Iodide of Iron is used in order to preserve the iodide of iron from injury.

(b) *Therapeutical effects.* Alternative, and affording the effects of iron and iodine.

(c) *Used in scrofulous diseases, and in cachectic states of the system.*

(d) *Dose.* 20 to 40 minims.

Turpentine, Spirit of.

(a) *Physical properties.* A limpid, colorless fluid, of a strong odor and hot taste, exceedingly inflammable.

(b) *Therapeutical effects.* Stimulant, diuretic, cathartic, and destructive to worms.

(c) *Used in hemorrhages, lumbago, etc., and to destroy worms; also externally as a rubefacient.*

(d) *Dose.* 10 drops to 30 internally, or 2 to 4 drachms mixed with castor oil as a vermifuge; but it should not be given internally without the sanction of a physician.

Tincture of Camphor (compound.) Purgative elixir.

(a) A tincture containing camphor, opium, anise, and benzoic acid.

(b) *Used in coughs.*

(c) *Dose.* 1 drachm.

Tincture of Ginger.

Dose. 1 drachm.

Tincture of Iodine. (See IODINE.)

Dose. 5 to 15 minims.

Tincture of Myrrh.

Dose. 30 to 60 minims. Useful as a wash for the teeth. Rarely used internally.

Tincture of Opium. Laudanum.

Dose. 6 to 20 minims.

Tincture of Quinine.

Dose. Teaspoonful.

Tincture of Rhubarb (compound). A very warm, useful preparation.

Dose. 2 to 4 drachms.

Tincture of Valerian (compound).

Dose. 30 to 60 minims, in dyspepsia and hysteria.

Tolu, Balsam of.

(a) *Physical properties.* Of considerable consistence; reddish brown in color; odor, very pungent; taste, warm, and sweetish.

(b) *Therapeutical effects.* A stimulant expectorant.

(c) *Used in chronic coughs, and also in wounds and ulcers.*

(d) *Dose.* 10 grains.

Valerian.

(a) *Physical properties.* Several long, slender, dusky-brown fibers, issuing from one head; strong, fetid odor; warm, bitterish, subacid taste.

(b) *Therapeutical effects.* Antispasmodic, tonic.

(c) *Used in hysteria.*

(d) *Dose.* 1 drachm.

Wine of Iron.

(a) Digest for 30 days 2 ounces of tartarated iron in a pint of sherry.

(b) *Therapeutical effects.* Stomachic and tonic.

(c) *Used the same as other steel medicines.*

(d) *Dose.* Two tablespoonfuls.

Wine of Opium.

(a) Prepared with opium and spices.

(b) *Therapeutical effects.* Stimulant, afterwards anodyne.

(c) *Used chiefly as an application to the eyes.*

(d) *Dose.* 10 to 20 minims.

Wine of Potassio-tartrate of Antimony. Antimonial wine.

(a) Dissolve 2 scruples of potassio-tartrate of Antimony in a pint of sherry.

(b) *Therapeutical effects.* Emetic and dia-phoretic.

(c) *Used in inflammatory diseases.*

(d) *Dose.* 15 to 60 minims.

Zinc, Chloride of. A powerful drug, but scarcely adapted to domestic use, except as a disinfectant, for which it is sold in solution. (See DISINFECTANTS.)

Zinc, Sulphate of. White vitriol.

(a) *Physical properties.* Transparent crystals.

(b) *Therapeutical effects.* Tonic, astringent, and emetic.

(c) *Used as a wash or as an emetic.*

(d) *Dose.* As an emetic, 10 to 30 grains; tonic, 2 grains.

CARE OF THE EYES.

A writer on the care of the eyes, in an English paper, says: "All are anxious to preserve the eyesight, but few know how effectually to do so, and many never think of the matter till failing sight warns them that it is absolutely necessary. By the latter," adds the same writer, "the following suggestions will be read with interest:—

"The sight in most persons begins to fail from forty to fifty years of age, as is evidenced by an instinctive preference for large print; a seat near the window for reading is selected; there is an effort to place the paper at a con-

venient distance from the eye, or to turn it so as to get a particular reflection of the light; next the finger begins to be placed under the line read, and there is a winking of the eye as if to clear it, or a looking away at some distant object to rest it; or the fingers are pressed over the closed lids in the direction of the nose, to remove the tears caused by straining.

"Favor the failing sight as much as possible. Looking into a bright fire, especially a coal fire, is very injurious to the eyes. Looking at molten iron will soon destroy the sight; reading in the twilight is injurious to the eyes, as they are obliged to make great exertion. Reading or sewing with a side light injures the eyes, as both eyes should be exposed to an equal degree of light. The reason is, the sympathy between the eyes is so great that if the pupil of one is dilated by being kept partially in the shade, the one that is most exposed cannot contract itself sufficiently for protection, and will ultimately be injured. Those who wish to preserve their sight should observe the following rules and preserve their general health by correct habits:—

"1. By sitting in such a position as will allow the light to fall obliquely over the shoulder upon the page or sewing.

"2. By not using the eyes for such purposes by any artificial light.

"3. By avoiding the special use of the eyes in the morning before breakfast.

"4. By resting them for a half minute or so while reading or sewing, or looking at small objects; and by looking at things at a distance or up to the sky; relief is immediately felt by so doing.

"5. Never pick any collected matter from the eyelashes or corners of the eyes with the finger nails; rather moisten it with the saliva and rub it away with the ball of the finger.

"6. Frequently pass the ball of the finger over the closed eyelids toward the nose; this carries off an excess of water into the nose itself by means of the little canal which leads into the nostril from each inner corner of the eye, this canal having a tendency to close up in consequence of the slight inflammation which attends weakness of eyes.

"7. Keep the feet always dry and warm, so as to draw any excess of blood from the other end of the body.

"8. Use eyeglasses at first, carried in the vest pocket attached to a guard, for they are instantly adjusted to the eye with very little trouble, whereas, if common spectacles are used, such a process is required to get them ready that to save trouble the eyes are often strained to answer a purpose."

ANTIDOTES FOR POISONS.

The following list gives some of the more common poisons and the remedies most likely to be on hand in case of need :—

Acids.—These cause great heat and sensation of burning pain from the mouth down to the stomach. The remedies are : Magnesia, soda, pearl ash, or soap dissolved in water, every two minutes ; then use the stomach pump or an emetic.

Alkali.—Drink freely of water with vinegar or lemon juice in it, made very strong of the sour.

Ammonia.—Remedy is lemon juice or vinegar.

Arsenic Remedies.—Give prompt emetic of mustard and salt, a tablespoonful of each, in a coffee-cup of warm water ; then follow with sweet oil, butter made warm, or milk. Also may use the white of an egg in half a cupful of milk or lime water. Chalk and water is good, and the preparation of iron, ten drops in water every half hour ; hydrated magnesia.

Alcohol.—First cleanse out the stomach by an emetic, then dash cold water on the head, and give ammonia (spirits of hartshorn).

Laudanum, Morphine, Opium.—First give a strong emetic of mustard and water, then very strong coffee and acid drinks ; dash cold water on the head, then keep in motion.

Belladonna.—Give an emetic of mustard, salt and water ; then drink plenty of vinegar and water or lemonade.

Corrosive Sublimate, Saltpetre, Blue Vitriol, Bedbug Poison.—Give white of egg, freshly mixed with water, in large quantities ; or give wheat flour and water, or soap and water freely, or salt and water, or large draughts of milk.

Lead.—White lead and sugar of lead. Give an emetic, then follow with cathartics, such as castor oil, and Epsom salts especially.

Nux Vomica.—First emetics and then brandy.

Oxalic Acid (frequently taken for Epsom salts).—First give soap and water, or chalk or magnesia and water. Give every two minutes.

White Vitriol.—Give plenty of milk and water.

Nitrate of Silver (lunar caustic).—Give a strong solution of common salt and water, and then an emetic.

Verdigris.—Give plenty of white of egg and water.

MEDICAL DICTIONARY.

Abatement. Decrease of fever.

Abdomen. The belly.

Abnormal. Unnatural, irregular.

Abscess. A collection of purulent matter.

Absorption, absorptive. Taking up or soaking up.

Acephalous. Without a head.

Acid. Sour ; a substance which neutralises alkalies.

Adhesive stripe, adhesive plaster. Cloth or other material coated on one side with sticking composition.

Afterbirth. A body attached to the womb and by a cord to the child, supplying blood and nourishment before birth.

Albumen, albuminous. One of the elements of the body that hardens with heat. The white of an egg.

Aliment, alimentary. Food. The alimentary canal begins with the mouth and ends with the rectum.

Alkali. Caustic ; a substance which neutralises acids.

Alternative. Altering or purifying the blood.

Alternating. One medicine following another after an interval.

Altruism. Regard for another.

Alveoli. The bony sockets to the teeth.

Alvine. Pertaining to the intestines.

Anemia. Deficiency in blood. The want of red corpuscles gives the pallid appearance to the skin.

Anesthesia. Deprived of sensation.

Anaphrodisiac. An agent to blunt sexual appetite.

Anastomosis. Communication between blood vessels.

Anatomy. A description of the organs of the body.

Anodyne. Relieving pain.

Antacid. Neutralizing acid.

Antibillous. A term applied to active cathartics.

Antidote. Medicines counteracting poisons and rendering them inert.

Anti-malarial. Preventing an attack of malaria.

Antiperiodic. Breaking up periodicity or appearance at regular intervals.

Antiperistaltic. Forcing the contents of the bowels backward into the stomach.

Antiseptic. Destroying poison.

Antispasmodic. Stopping spasms.

Antrum. A cavity in the superior maxillary bone, connected with the nose.

Anus. The lower opening of the bowel.

Aorta. A large artery arising from the heart.

Aperient. A gentle laxative or purge.

Aphonia. Loss of voice.

Aphthous. Affected with aphthæ ; a curd-like covered sore.

Areola, areolar. The connecting tissue between fibers and vessels. Pertaining to areole.

Artery. A blood vessel which (with one exception) carries the red blood.

Asphyxia. Suspended animation.

Aspirator. A pumping apparatus with a long, fine, sharp-pointed tube for removing fluids from internal parts.

Assimilation. The act of transforming the food into various parts of the body.

Asthenic. Debilitated.

Atrophy, atrophied. Wasting away. Withered.

Auscultation. Discovering chest diseases by listening.

Axillary. Arising from a depression between the stem and leaf-stock.

Bandage. A long piece of cloth, of variable width, used for binding.

Benumb. To deprive of sensibility.

Bicuspid teeth. The fourth and fifth teeth from the center of the lips.

Bile, bilious. A fluid secreted by the liver. Pertaining to bile ; a peculiar temperament.

Blastema. A germ.

Bloodletting. Opening a vein in the arm to let out blood.

Bolus. A large pill or anything of its size.

Bougie. A flexible instrument for dilating the urethra.

Bronchial tubes. Vessels carrying air to the lungs.

Bronchi.

Bronchus, bronchi. The lower air-passage.

Buccal walls. Inner surface of the cheeks.

Cacoplasm. Bad or low form of organization.

Cæcum. A part of the intestines emptying into the colon ; the blind gut.

Calcareous. Of the nature of lime.

Calculus, calculous. A stony formation. Pertaining to calculus.

Capillary. Blood vessels, hair-like in size.

Capsule. A covering or case.

Carbon. One of the elementary bodies or metalloids.

Cardiac. Pertaining to the heart.

- Carnivora.** Flesh-eating animals.
- Cartilage, cartilaginous.** A white, elastic solid part of the body. Gristle. Gristly.
- Caseous.** Like cheese.
- Castration.** Removing the testicles.
- Catamenial.** Relating to the monthly flow.
- Cathartics.** Agents that produce evacuation of the bowels.
- Catheter.** A tube with an eyelet near its end, used for conveying fluids.
- Caustics.** Corrosive or burning substances.
- Celibate.** A bachelor.
- Cell.** The smallest particle of living matter. The body and all of its parts are made up of cells.
- Cellular tissue.** The tissue uniting all parts of the body.
- Cerebellum.** The small or lower brain.
- Cerebrum.** The great or upper brain.
- Cerumen, ceruminous.** Ear-wax. Waxy.
- Cholesterine.** A crystallizable substance formed in the bile.
- Chronic.** Long standing, seated.
- Chyle.** The milky fluid formed from digested food, and which is emptied directly into the blood vessels.
- Chyme.** Digested food.
- Cicatrix, cicatrices.** The scar from a wound. Scars.
- Circulation.** The flow of blood from the heart to the extremities and back again.
- Circumcision.** The act of cutting off the foreskin or prepuce of males.
- Clonic.** Rigid, with occasional relaxation of the muscles.
- Coagulate.** To harden, as the white of an egg, by boiling.
- Coitus.** Sexual connection.
- Collapse.** Complete prostration or inaction.
- Colliquative.** Exhaustive.
- Coma.** Comatose, profound sleep.
- Conception.** Being with child in the womb.
- Congenital.** Dating from birth.
- Congestion.** The flow of blood to a part. Stagnant circulation.
- Conjunctiva.** The membrane covering the ball of the eye and inner surface of the eyelids.
- Contagion.** Communication of disease from one to another by touch, food, drink, or the atmosphere.
- Continence.** Abstinence from sexual congress.
- Convalesce, convalescence.** To recover health and strength. Period of recovery.
- Convulsions.** Spasms.
- Cornea.** The tough transparent membrane in the front of the eyeball.
- Corpuscle.** A minute body. A particle.
- Corroborant.** A remedy which gives strength; tonic.
- Corrosive.** Burning.
- Cortical.** The bark or external portion.
- Costiveness.** Irregular and delayed motion of the bowels. Constipation.
- Counter-irritation.** Irritating one part to relieve irritation in another.
- Cramps.** Sudden and painful contractions of muscles.
- Cranial.** Belonging to the skull.
- Crisis.** The period of change; it may be to worse or to better.
- Cul-de-sac.** A pouch.
- Cupping.** Drawing blood by lancing, and the application of a heated cup.
- Decussate.** To cross each other.
- Defecation.** Evacuation of the bowels.
- Dejections.** Matter voided from the bowels.
- Delirium.** Mental aberration.
- Deltoid muscle.** A muscle passing over the shoulder and terminating at the center and outer part of the upper arm.
- Depurative.** Purifying. Removing impurities.
- Dextrine.** A substance obtained from starch.
- Diagnosis.** Discovery of a disease by its symptoms; discriminating between a disease and others with which it may be confounded.
- Diaphoretic.** Inducing perspiration; sweating.
- Diaphragm.** The muscle separating the chest and its contents from the abdomen and its contents.
- Diastaltic.** Reflex action induced by the spinal marrow.
- Diathesis.** Tendency of the constitution to a particular disease.
- Diathetic.** Relating to predisposition to disease.
- Dietic, dietetic.** Relating to the food and drink.
- Digestion.** Conversion of the food into form suitable for nourishment and into refuse or excrement.
- Disinfectant.** Purifying or cleansing from infection.
- Diuretic.** Increasing by secretion the quantity of urine.
- Dram.** One-eighth of an ounce, or a teaspoonful of fluid.
- Drastic.** Very powerful cathartic action.
- Duc.** Canal.
- Duodenum.** The first part of the intestines.
- Dysmenorrhœa.** Painful menstruation.
- Dyspnoea.** Difficult breathing.
- Economy.** The parts constituting the body or the laws governing them.
- Effete.** Worn out; useless.
- Effusion.** Escape of a fluid.
- Elimination.** Ejection by stimulating the secreting organs.
- Eliminatives.** Agents which expel substances from the body, as by the skin, kidneys, etc.
- Emaciation.** Loss of flesh.
- Embryo.** The animal in its earliest existence in the uterus.
- Emesis.** Vomiting.
- Emission.** A discharge.
- Emulsion.** A pharmacal compound of oil and water.
- Emunctory.** Any organ of the body acting as the outlet of effete and worn-out matter.
- Enciente.** Pregnant.
- Encephalon.** The head; all within the head.
- Encysted.** Covered with a membrane or sac.
- Endosmosis.** Fluids passing through membranes into structures.
- Enema.** Liquid injections into the bowel.
- Enervation.** Weakness.
- Enteric.** Intestinal.
- Entozoa.** Worms.
- Epidemic.** A disease attacking many individuals in a locality at the same time.
- Epithelial.** Relating to the thin covering to the eyes, lips, mouth, intestines, and the like.
- Erosion.** Corrosion; eating away.
- Erosia.** Amatory passion.
- Eruptions.** Wind or gases raised from the stomach with some noise.
- Essence, essential.** The active principle of plants. A diluted oil.
- Eustachian tube.** A canal about two inches in length connecting the ear and back of the mouth (pharynx).
- Exacerbation.** Increase in fever.
- Exanthematous.** Attended with fever and skin eruptions.
- Excito-motory.** Reflex nervous action.
- Excito-nutrient.** Affecting nutrition by reflex nervous action.
- Excito-secretory.** Affecting secretion by reflex nervous action.
- Excrement, excrementitious.** Matter ejected from the bowel.
- Excretion, excretive.** The faculty of selecting and discharging from the system fluids, as in sweating and in urine, useless matter as in feces, and impurities by either.
- Exhaling.** Breathing out; throwing off vapor.
- Expectorant.** Remedies which loosen phlegm in the air-passages, and hence facilitate its discharge and relieve oppressed breathing.
- Expectorate.** To discharge mucosities by coughing and spitting.
- Expiration.** Exhaling air by the lungs.
- Extravasate.** To escape from the containing vessel and permeate the surrounding textures.
- Exudation.** Escaping or discharging through pores.
- Farinaceous.** Containing farina or flour.
- Fascicles.** Little bundles of fibers.
- Fauces.** The back of the mouth and upper part of the throat.
- Feces, fecal.** That part of the food remaining after digestion and which is ejected at intervals from the bowels.
- Feculent.** Foul.
- Fermentation.** Chemical action and combination by which new substances are formed.
- Fiber, fibrous.** The hard, elastic, organic particle which, aggregated, forms muscle and other tissues.
- Fibrine.** An organic substance, fluid, coagulable, found in the blood, lymph, etc.

- Filaments.** A thready fiber.
- Flagellation.** Flapping the body with the corner of a wet towel or the snap of a whip.
- Flatulence.** Wind in the stomach and bowels.
- Fetus, foetal.** The young of any animal during uterine existence. Pertaining to the unborn.
- Follicle.** A little depression throwing off moisture to keep the contiguous part soft and supple.
- Foreskin.** The prolonged skin of the penis, which covers the glans or head.
- Fumigation.** Disinfection by gas, smoke, or vapor.
- Function.** The normal or healthy action of an organ.
- Fundament.** The seat; anus.
- Fungus.** Parasitical plant.
- Ganglion.** Masses of nerves resembling brain.
- Ganglionic.** Composed of ganglia.
- Gangrene.** Mortification; local death.
- Gastric juice.** The digestive fluid secreted by the stomach.
- Generative.** Productive.
- Genetic.** Pertaining to the genital organs.
- Genitals.** The generative organs.
- Germ theory.** The theory of the propagation of disease by germs floating in the atmosphere.
- Gestation.** The period of carrying the young in the womb.
- Glands, Glandular.** Organs of the body, each possessing vital properties peculiar to itself, as secretion of tears, milk, saliva, urine, excretion, etc.
- Glans.** The conical end of the penis, covered by the foreskin.
- Gluten.** The ingredient in flour (farine) which gives it adhesiveness.
- Grain.** One sixtieth of a drachm.
- Grainivora.** Grain-eating animals.
- Granular.** Consisting of little grains.
- Granules.** Little grains.
- Gripping.** The pains of colic.
- Gullet.** The canal for food leading from the throat to the stomach.
- Gynecology.** That part of the science of medicine devoted to the diseases of women.
- Hectic.** Debilitated; exhausted.
- Hereditary.** Transmitted from parent to child.
- Hibernate, hibernation.** A partial suspension of animation. Animals that sleep through the winter hibernate.
- Histogenetic.** Tissue-forming.
- Hydragogues.** Medicines producing copious, watery, alvine discharges.
- Hydrocarbons.** Starch, sugar, and oils.
- Hydrogen.** A light, inflammable gas, forming, by chemical combination, water and animal and vegetable matter.
- Hygiene, hygienic.** The science of the preservation of health.
- Hymen.** A fold of membrane at the outer orifice of the vagina, found sometimes, but not always, in virgins.
- Hypertrophy.** Increased nutrition and consequent growth.
- Hypnotic.** Producing sleep.
- Hypochondriasis.** Belief in the possession of an imaginary disease.
- Hypodermic.** Under the skin.
- Hypodermic syringe.** An instrument for injecting liquid remedies under the skin.
- Ileum.** The convoluted portion of the intestines.
- Impotence.** Loss of sexual power; inability to copulate.
- Indications.** The symptoms or conditions needing medication.
- Infection, infecting.** The communication of disease by touch, food, drink, or the breath.
- Infecundity.** Unfruitfulness.
- Infiltrate.** To penetrate the pores of a part.
- Inflammation.** A condition attended with heat, pain, redness, and swelling.
- Injection.** Passing a liquid into a cavity of the body, through and by means of a syringe.
- Innocuous.** Harmless.
- Inoculation.** Taking a disease by contact with an abraded surface.
- Insolation.** Sunstroke.
- Insomnia.** Inability to sleep.
- Inspiration.** Inhaling air by the lungs.
- Insipated.** Thickened by evaporation.
- Instinct.** An inborn principle directing to health and self-preservation.
- Intercoastal.** Between the ribs.
- Intestine, intestinal.** The canal from the stomach to the anus; the bowels. Relating to the intestines.
- Invermiration.** Infested with worms.
- Iris.** The colored membrane seen in the eyeball; it is blue in blue eyes, gray in gray eyes, etc.
- Irritation.** Local excitement, or excess of vital action.
- Kidneys.** Two organs, one on each side of the spine, internally and above the small of the back, which secrete the urine from the blood.
- Lachrymal gland.** Organ for forming tears.
- Lachrymation.** Weeping.
- Lacteal.** Milky. Vessels containing chyle.
- Larynx.** The Adam's apple of the neck; the upper part of the windpipe which contains the organs of voice.
- Lancinating.** A deep and sudden pain, compared to the stab of a lance.
- Leeching.** Removing blood by the application of a leech.
- Lesion.** A diseased change.
- Leucocytes.** White corpuscles of the blood.
- Leucorrhoea.** Whites.
- Liquor sanguinis.** The fluid part of the blood, holding in solution fibrine, albumen, etc.
- Liver.** The great assimilating gland of the body. It is situated below the diaphragm or midriff, and above the stomach, bowels, and kidney, and extends from the base of the chest to the spine, and from side to side.
- Lobe.** A rounded, projecting part.
- Loins.** The small of the back, between the ribs and pelvis.
- Lungs.** Two organs situated in the chest, one on each side, with the heart between; the organs of respiration.
- Lymph, lymphatic.** The fluid secretion of the lymphatic glands, which is emptied into the circulation.
- Mackintosh.** Cloth covered with waterproof material.
- Malaria.** Poisoning emanations in the air, producing disease.
- Mammary gland.** The female breast.
- Mastication.** Chewing the food.
- Masterbation.** Personal excitement of the sexual organs.
- Median line.** An imaginary line dividing the body into the right and left side.
- Medulla oblongata.** An organ, marrow-like, lying at the base of the skull.
- Medullary.** Pertaining to the marrow.
- Membrane, membranous.** A thin, web-like structure covering parts and organs, and lining cavities.
- Meninges.** Coverings of the brain and spinal cord.
- Menses, menses.** The monthly uterine flow during the middle age of women.
- Menstrual.** Pertaining to the monthly flow.
- Mesentery.** The folds of the peritoneum which hold the intestines in place.
- Metamorphosis.** Transformation.
- Metastasis.** Change in the seat of a disease.
- Miasm, miasmatic.** The germs of disease floating in the air, which produce infection.
- Microscope.** An instrument for magnifying minute objects.
- Micturate.** To evacuate the bladder.
- Molar teeth.** The sixth, seventh, and eighth teeth from the center of the lips.
- Molecule.** A little portion of any body.
- Morbid.** Diseased.
- Motor.** Moving.
- Mucilages.** The gummy principle of plants.
- Mucoid.** Like mucus.
- Mucus, mucous.** A viscid fluid, which in health keeps the membranes in their proper condition.
- Myopic.** Near-sighted.
- Narcotic.** A stupefying remedy; in large doses destroying life.
- Nausea.** Sickness at the stomach; ineffectual effort to vomit.
- Navel.** The round scar at the center of the abdomen, marking the place of attachment of the cord previous to and at birth.
- Neuralgia.** Nerve-pain.
- Neurine.** The substance of which the brain is composed.

Nitrogen, nitrogenous. The gas constituting four fifths of the volume of the atmosphere.
Noxious. Poisonous; harmful.
Nucleus, nuclei. The germinal point in a cell; kernel.
Nutrition. Increasing in growth, or supplying the materials for growth.

Obcordate. Half egg-shape and half heart-shape.
Obesity. Excessively fat.
Esophagus. The food-passage from the throat to the stomach.
Oestruation. Periodical sexual desire; heat.
Oleaginous. Oily.
Ophthalmoscope. An instrument for examining the interior of the eye by concentrated and reflected light.
Optic nerve. The nerve conveying visual impressions from the eye to the brain.
Osmosis. Attraction of fluids for each other through moist membranes and their motion.
Occicles. Little bones.
Ounce. One sixteenth of a pound; in fluids, eight drachms or teaspoonfuls.
Oxygen. The gas constituting one fifth the volume of the atmosphere. It supports combustion.

Pad. A folded cloth used as a support.
Palate. Roof of the mouth.
Palatine arch. The arch in the rear of the mouth, formed by the palate bone.
Palsy. Loss of sensation or motion, or both; paralysis.
Pancreas, pancreatic juice. A large gland in the abdomen, beneath and behind the stomach. Its secretion.
Papillae. Little raised points upon the surface; they can be seen upon the tongue.
Papulose, papular. With dry pimples.
Paralysis. To lose the power of motion in a part, or sensation, or both.
Parasites. Animals or plants that subsist upon others.
Parenchyma. The texture of organs like the liver, kidneys, etc.
Parotid gland. A gland at the angle of the lower jaw which secretes saliva and discharges it by a short tube upon the cheek near an upper molar (back) tooth.
Paroxysm. The period of more aggravated symptoms, following an interval of comparative freedom.
Parturition. Childbirth.
Pathology. That department of medical science whose object is the knowledge of disease.
Pelvis. The bony structure at the termination of the spine, enveloping and protecting the lower intestines, bladder, genitals, etc.
Pentandria Monogynia. A name given to a class of plants having five stamens and one style.
Perussion. Striking with the finger-tips to discover by the resonance the condition of internal parts.
Perineum. The part between the genitals and the anus or tip of the spine.
Periodicity. Occurring at regular periods, as a chill every other day, etc.
Pericostium. The tough membrane covering all bones.
Peristaltic. The peculiar motion of the intestines which propels its contents forward, somewhat like the crawling of a worm.
Peritoneum. The membrane lining the abdominal walls and covering the intestines.
Petaloid. Resembling a leaf-stock.
Petals. The colored leaves of a flower.
Pharmacist, pharmacist. One who manufactures drugs.
Pharmacy. The manufacture of drugs.
Pharynx. The posterior portion of the cavity of the mouth, behind the palate, above the windpipe and gullet. The breath and food pass through it.
Phosphorus, phosphates. A substance familiar to us in matches. It is a constituent of the brain and nerves.
Phrenic nerve. The respiratory nerve. It arises in the neck, passes through it and the chest, and is mainly distributed to the diaphragm.
Physiology. The functions of the organs of the body; the phenomena of life.
Pile-compressor. An instrument supporting the rectum and anus.
Placenta. A fleshy body attached to the womb and by a cord to the child, supplying blood and nourishment before birth.

Plasma. The fluid portion of the blood holding in solution fibrine, albumen, etc.
Plastic. Formative.
Plethora. Abounding in blood; full-blooded.
Pleura. A wetted membrane lining the walls of the chest and covering the outer surface of the lung. There are two.
Plexus. A network of blood-vessels or nerves.
Pneumogastric nerve. The great nerve distributed to the chest and stomach.
Polypus. A kind of tumor.
Post-mortem. After death.
Prepuce. The prolonged skin of the penis which covers the glans or head.
Probang. A whalebone rod with a sponge on one end.
Probe. A wire for examining wounds, canals, etc.
Prophylactic. Preventive.
Prostate gland. A gland at the upper portion of the urethra surrounding it and touching the bladder.
Psoas muscle. The great muscle which draws the thigh up to the abdomen.
Puberty. That period of life, about the age of 12, when the procreative organs most rapidly develop; hair grows about them and upon the face of the male, the breasts of the female enlarge, and, in fact, the period of youth has passed and that of manhood or womanhood arrived.
Pubic bone. A bone in the lower abdomen immediately under that part of the surface covered with hair.
Pulse. The beating or throbbing of arteries produced by afflux of blood from heart.
Pupil. The circular opening in the colored part of the eye (iris).
Purgative. A medicine causing free alvine discharges.
Pus. Matter discharged from inflamed tissue.
Pustules. Mattery pimples.

Receptaculum chyli. A hollow organ for holding chyle.
Rectum, rectal. That portion of the bowels nearest the outlet.
Recuperate. To regain health and strength.
Regurgitate. To flow backward.
Remission. Decrease in fever.
Renal. Pertaining to the kidney.
Respiration. Breathing.
Retching. Ineffectual effort to vomit.
Retina. The lining of the eye.
Reversive. Agents which create diseased action on the surface to relieve internal disorder.
Roborant. Strengthening; tonic.
R, recipe. Take the articles following.

Saccharina. Of the nature of sugar.
Saliva. One of the digestive fluids which is mixed with the food during mastication.
Sanitarium. A remedial institute.
Schneiderian membrane. The lining of the nasal cavity.
Scrofulous. Of the nature of scrofula.
Scrotum. The skin covering the testicles.
Sebaceous. A name given to the oil-glands of the skin.
Secernent. Secreting.
Secrete, secretion. Drawing out fluids from the blood; each gland absorbs material peculiar to itself.
Sedatives. Remedies which control or depress excessive vital action.
Self-pollution. Personal excitement of the sexual organs.
Semen. The fecundating fluid of the male which is secreted by the testicles.
Seminal. Pertaining to semen or sperm.
Sensorium. The center of sensations.
Sepals. The leaves of the envelope of a flower.
Serum, serous. The watery portion of animal fluids.
Sigmoid flexure. A bend in the intestines just above the rectum.
Sinapism. An irritating plaster.
Sound. A solid rod, catheter shape.
Spasms. Violent and involuntary muscular movements.
Specific disease. Syphilitic diseases; private diseases.
Speculum. An instrument for dilating the orifice to internal canals or cavities.
Spermatic. Pertaining to sperm or the organs of generation.

Spermatic cord. A cord consisting of blood-vessels, nerves, and the canal of the sperm, which supports the testicle.

Spermatozoa. The formative agents in generation found in the semen of the male.

Sphincter. A round muscle closing an outlet.

Splinter. A splinter of bone.

Spleen. A spongy organ situated deep in the upper abdomen, between the kidney and stomach.

Sputa. Expecterated matter.

Squamous. Scaly.

Stercoraceous. Excrementitious.

Sternutatives. Remedies which provoke sneezing.

Stethoscope. An instrument for exploring the chest.

Sthenia. Possessing excessive strength.

Stun. Unconsciousness produced by a blow or fall.

Stupor. Diminished sensibility or exercise of the intellectual faculties.

Styptic. Arresting hemorrhage; astringent.

Sublingual gland. A salivary gland under the tongue.

Sudoriferous. A name given to the sweat glands of the skin.

Suppository. A semi-solid medicine deposited in the rectum.

Suppurate. To discharge matter or pus.

Suspensory bandage. A bandage for supporting the scrotum.

Sympathetic nerves. The nervous system of the automatic functions.

Symptom. A sign of disease.

Syncope. Fainting.

Tampon. A plug made of lint or cotton.

Tapping. Drawing off fluids in cavities by puncturing the surface.

Tenesmus. Violent contractions.

Testes. The male organs contained in the scrotum.

Testicles. Testes.

Tetanus. Permanent contraction of muscles.

Therapeutics. The department of medical science concerned in the treatment of disease.

Thoracic. Pertaining to the chest.

Thyroid glands. Throat glands.

Tissues. The anatomical elements of organs.

Tonica. Remedies which improve the health and strength.

Tonsil. A gland at the side of the throat near the soft palate.

Toxic. Poisonous.

Trachea. That part of the windpipe between the larynx or vocal organs and the bronchial tubes.

Traumatic. Pertaining to a wound.

Tubercle. Concretions of degenerated matter.

Tube. A little tube or canal.

Tympanitic. Having a drum-like sound from the accumulation of air.

Tympanum. The drum of the ear.

Ulcer, ulceration. A chronic sore situated in the soft parts. A diseased action resulting in ulcer.

Umbilicus. The navel.

Uræmic. Pertaining to urine.

Urea. A constituent of urine.

Ureters. The canals, two in number, carrying the urine from the kidneys to the bladder.

Urethra. The canal or pipe leading from the bladder for the conveyance of urine from the body.

Uric acid. A constituent of urine; in excess it forms combinations, producing calculus or stone.

Urine. The secretion of the kidneys which collects in the bladder and is discharged through the urethra.

Uterus. An organ situated between the bladder and rectum and above the vagina, which holds the fetus during gestation.

Uvula. A fleshy organ hanging from the center of the soft palate.

Vaccine. Pertaining to smallpox.

Vagina. The canal, five or six inches in length, leading to the uterus or womb.

Varicose. Pertaining to a dilated vein.

Vascular. Full of blood-vessels.

Vaso-motor. Affecting vessels by reflex nervous action.

Vein. A blood-vessel which, with one exception, carries the blue or venous blood.

Ventricle. A chamber in the heart.

Vertigo. Dizziness.

Vesicle. A bladder-like sac.

Vesicular. Full of little vessels.

Vicarious. In place of another; a function performed through other than the natural channels.

Virus. The poison transmitting infectious disease.

Viscus, viscera. An organ of the body. Organs.

Vitality. The vital principle.

Void. To evacuate.

Vomiting. Emptying the stomach upward.

Water-brash. A profuse flow of saliva.

Womb. An organ situated between the bladder and rectum and above the vagina, which holds the fetus during gestation.

Zoon, Zoa. Animal. Animals.

Zymotic. Epidemic and contagious.

THE HEART OF NEW YORK.

Book VI.

Finance, Industry, Transportation.

Finance, Industry, Transportation.

EARLY FORMS OF CURRENCY.

Skins of wild animals cured constitute one of the earliest forms of currency known, and while employed in the most ancient times, are not yet disused in some portions of the world. Such a medium seems appropriate among those who subsist by the chase, as all primeval peoples must in some degree, and it is not, therefore, surprising to find that in the transactions of the Hudson Bay Fur Company with the Indians, the unit of value by which the price of other articles was reckoned was the beaver skin.

Pastoral people employ similarly the skins of tame animals, originally delivering the entire skin, a cumbrous process deficient in convenience and economy, but finally employing a small disc cut from the leather as a representative of its value. Live stock is also widely employed, as it has been from the days of Abraham, and though a rude, it is still a substantially uniform, denominator of value. The Greeks stamped the image of an ox on a piece of leather, and the image had thence the current value of the animal represented. In the East, the camel, the ass, and the sheep have been, ever since they were subdued to the uses of mankind, employed to reckon possessions or determine the amount of tribute or marriage portions. In Lapland and some portions of Sweden and Norway, the amount of wealth possessed by a person is denominated in reindeer. Among the Tartars the number of mares similarly determines the opulence of their possessors. Among the Esquimaux it is customary to speak of one another as worth so many dogs.

Slaves have been employed to determine ratios of value since the state of bondage was first established among men. In New Guinea the slave is still the unit by which the value of other possessions is recorded, as he used to be among the Portuguese traders of the Gold Coast. The Portuguese also found small mats called libongoes, valued at about one and one half pence each, employed as currency on the African coast, and bunches of red feathers serve by their comparative stability to mark the fluctuations of yams and breech-clouts in some of the tropical islands of the Pacific. Some tribes of North American Indians found wampum as useful in their rather limited mercantile transactions as the merchant of South street or Burling slip finds greenbacks or bills of exchange.

Cowry shells are still extensively used in

East India, Siam, and among some of the islands of the Indian Archipelago. Among the Fijians whales' teeth pass readily from hand to hand, effecting all necessary interchanges, the red teeth being taken at about twenty times the value of the white ones.

Ornaments of all kinds have in all times constituted measures of value. In Egypt, Phœnicia, Etruria, and many other ancient countries, as well as in Ireland and Northumbria, rings have been found which were designed to serve the double purpose of ornament and currency, and the same dual function may be ascribed to the anklets, armlets, and earrings which are worn throughout British India, Persia, Egypt, and Abyssinia. The Goths and Celts fashioned their rings of thick golden wire wound in spirals, from which various lengths could be broken to accommodate the varying needs of traffic. Gold chains have been similarly employed. In many countries golden beads are yet hoarded, worn, and circulated, fulfilling thus the triple functions of money, inasmuch as they constitute at once a store of value, a standard of value, and an instrument of exchange. Amber was used as currency by the savage races of the Baltic in the period of the Roman dominion, as it still is in some of the regions of the East. The Egyptian scarabee carved on sard or nephrite or other precious stones, circulated freely throughout the Mediterranean coasts and islands probably before the first Phœnician coin was impressed; and engraved gems and precious stones were employed to transfer wealth as well from one country to another as from hand to hand until a comparatively recent period. In Africa ivory tusks pass to and fro in the processes of trade, rudely defining the ratio of value of other articles. Among the Tartars, bricks of tea, or cubes of that herb pressed into a solid form, pass from hand to hand as freely as beaver skins do at the trading posts of Hudson Bay or the Saskatchewan. Among the Malaysians the only currency entirely equal to the requirements of trade consists of rough hardware, such as hoes, shovels, and the like. Pieces of cotton cloth of a fixed length, called Guinea cloth, for a long period constituted the unit of value in Senegal, Abyssinia, Mexico, Peru, Siberia, and some of the islands of the Pacific Ocean. In Sumatra, cubes of beeswax of a fixed weight; in Scotland handmade nails; in Switzerland, eggs; in Newfoundland, dried codfish; in Virginia, tobacco; in Yucatan, cacao nuts; in

the Greek Islands and the Levant, olive oil; in the regions of the Upper Nile, salt, have all, at one time or another, served the purposes of commercial interchange. In agricultural countries it is not strange that corn should have early been adopted as a measure of value. The leases of the great school foundations of Britain, Cambridge, Oxford, and Eton, with probably many others, were "corn leases," that is, specifying that the rental should consist of so many quarters of corn. In Norway, corn is deposited in banks and lent and borrowed on time or call loans, as money is with us. In Central America and Mexico, maize was long employed to serve the uses of currency.

In New England, in the early colonial days, leaden bullets were employed to indicate value, and that metal is still coined and circulated in Burmah. Pewter has often been coined, and in many countries, though not to the same extent as tin. In fact, tin coins are not only of immense antiquity, but their impress has been sanctioned by government authority down to a recent period. The Phœnician mariners freighted their galleys with the tin of Britain before Carthage was founded, and coins of the same oiled the wheels of commerce in the marts of Tyre and Sidon before Solomon built the temple at Jerusalem. In England, as late as the period of William and Mary, tin half-pence and farthings were struck, though they failed to become a permanent part of the circulation. In numismatical collections, series of tin coins stamped with the effigy and legend of several of the Roman emperors are abundant. In Java as well as Mexico, tin coins were once current, and the metal, measured by weight, is still a sort of legal tender in the Straits of Malacca.

METALLIC COINS.

In all civilized countries, gold, silver, and copper have always constituted the main elements of coinage and the most familiar forms of currency. The ratio of value between the first two has probably varied less during the last 2,500 years than that between any other known substances. Copper has fluctuated more, but its function has always been subsidiary and limited to small transactions. In the hierarchy of the metals used as coins, gold may represent the king, silver the lord, and copper the slave. The latter is now practically emancipated, bronze and nickel taking its place. Indium, osmium, and palladium have been proposed as substitutes for gold, and aluminum and manganese for silver, but without any practical result thus far. Platinum, which is mainly found in the Ural Mountains, has been coined to some extent by the Russian government;

but, although a beautiful and valuable metal, possessing many of the qualities to render it acceptable as coin, its employment as money has been found to be impracticable.

Great numbers of alloys have been employed in coinage, and indeed it may be said that almost the entire system of metallic currency throughout the world is composed of alloys. The Tuscan sequin, the purest coin known in history, contained 999 parts of gold in 1,000. The six ducat piece of Naples was next in purity, having only an alloy of 4, while old Byzantine coins called bezants contained an alloy of 14 parts in 1000. Pure gold and silver, however, are soft metals, and untempered by others are subject to serious loss by abrasion. They are, therefore, rendered more useful by the admixture of a small portion of copper which, in the English system, in the case of gold, may be expressed decimally by 916.66, and of silver 925 parts in 1,000. Nickel is usually alloyed with three parts of copper, and it is noteworthy that its adoption as a subsidiary coinage in Germany, coincident with the demonetization of silver, caused it to advance rapidly in price, while the latter was as rapidly declining. The old Roman *as* was made of the mixed metal called *as*, a compound of copper and tin, and in quality and value not unlike bronze. Brass was also extensively used from the time of Hiram of Tyre to that of the Emperor Otho. The old Kings of Northumbria coined a small money called *stycas* out of a natural alloy, composed of copper, zinc, gold, silver, lead, and tin, which the metallurgists of that rude northern coast had not enough chemical skill to separate.

Lycurgus established an iron coinage for Lacedæmon, not only making the coins of such weight and bulk as to forbid their export, but depriving them of their metallic value by causing them while heated to be plunged into vinegar, thereby destroying their malleability.

While these coins were the largest of which historic mention is made, the Portuguese *rei*, too small to be actually coined, is doubtless the smallest unit of value in the money systems of the world. It is only about the nineteenth part of an English penny, and is considerably smaller than the Chinese cash, which, of actual coins, is perhaps of the lowest value known. In Sweden, during the last century, huge squares of copper, weighing between three and four pounds, with a stamp in each corner and one in the center, were issued as coin, and curious specimens of them may still be seen in numismatical collections. These, with the Maundy money, a small portion of which is still annually struck at the British Mint, and distributed by Her Majesty in alms, probably

represent the extremest variation of dimensions known among modern systems of coinage, the smallest piece of the Maundy money being a silver penny.

The Chinese probably illustrate in the most extreme manner the length to which loose views concerning currency can be carried. The history of their currency presents that mingling of the grotesque with the tragic which most of their actions have when viewed through Western eyes. Coined money was known among them as early as the eleventh century before Christ, but their inability to comprehend the principles upon which a currency should be based has led them into all sorts of extravagances, which have been attended by disorder, famine, and bloodshed. Coins came at last to be made so thin that one thousand of them piled together were only three inches high; then gold and silver were abandoned, and copper, tin, shells, skins, stones, and paper were given a fixed value and used until, by abuse, all the advantages to be derived from the use of money were lost, and there was nothing left for the people to do but to go back to barter, and this they did more than once. They cannot be said now to have a coinage; 2900 years ago they made round coins with a square hole in the middle, and they have since made no advance beyond that. The well-known cash is a cast brass coin of that description, and although it is valued at about one mill and a half of United States money, and has to be strung in lots of one thousand to be computed with any ease, it is the sole measure of value and legal tender of the country. Spanish, Mexican, and the new trade dollars of the United States are employed in China; they pass because they are necessary for larger operations, and because faith in their standard value has become established; but they are current simply as stamped ingots, with their weight and fineness indicated.

The coined money of Great Britain is the most elegantly executed, and among the purest in the world. The greater part of the continental coinage is poorly executed and basely alloyed. In Holland, and most of the German states, the coins legally current as silver money are apparently one third brass, and resemble the counterfeit shillings and sixpences of a former period in England. In France and Belgium, the new gold and silver coins are handsome, and so likewise are the large gold and silver pieces of Prussia. The coins and medals executed by direction of Napoleon in France are in a high style of art.

The Latin Monetary Union was established in December, 1865, for the purpose of maintaining the double standard of metallic cur-

rency, or keeping silver at a constant ratio with gold. The combination was formed by a union of France, Italy, Belgium, and Switzerland.

The possible depreciation of silver was foreseen, and some of its fluctuations had been experienced, but it was thought that, by a close union of silver-using powers rating silver at a common value, its price could be made permanent. At first the combination proceeded boldly. It threw open the mints of the Union to bullion owners, declaring that it would coin silver at the ratio to gold that it had established of fifteen and one half to one, and proclaimed that the coins thus issued should have in the markets both a legal tender efficiency and an intrinsic efficiency in exchange exactly represented by that proportion.

The plan worked well until the year 1873, when Germany demonetized silver. But in the meantime it was sought to give the double standard a broader foundation by bringing other nations into the combination. For this purpose, at the invitation of the French government, forty-five representatives of twenty-three countries met at Paris, in 1867. The proposed double standard was examined and discussed from every point of view by men skilled in financial science, and was at last rejected by a vote of forty-three to two. In 1870, there was a second gathering of the same kind, which, by a smaller majority, arrived at the same conclusion. Meantime silver had begun to accumulate, and depreciation to foreshadow itself more clearly. The demonetization of the metal by Germany gave the first sharp alarm. The Union was immediately forced to limit the coinage for 1874 to \$24,000,000. This was increased to \$30,000,000 in 1875, but again reduced in 1876 to \$24,000,000, and in 1877, to \$11,600,000. In the meantime, also, France, Belgium, and Switzerland stopped the coinage of five-franc pieces, thus reducing what silver they had to a large subsidiary currency. Later signs of the dissolution of the Union with the defeat of its objects were supplied by the failure of the monetary conference at Paris, and by the withdrawal of Switzerland from the Union.

GREAT BRITAIN, COINED MONEY OF.

In Great Britain, money of the current and standard coinage is frequently signified by the term sterling, as "one pound sterling," etc. With respect to the origin of the word sterling there are three opinions. The first is that it is derived from Stirling Castle, and that Edward I., having penetrated so far into Scotland, caused a coin to be struck there, which he

called Stirling. The second opinion derives it from the figure of a bird called starling, which appears about the cross in the ancient arms of England. The third most probably assigns its true origin, by deducing it from Esterling; for in the time of Henry III., it is called *Moneta Esterlingorum*, the money of the Esterlings or people of the East, who came hither to refine the silver of which it was made, and hence it was valued more than any other coin, on account of the purity of its substance. The denomination of the weights and their parts is of the Saxon or Esterling tongue, as pound, shilling, penny, and farthing, which are so called in their language to the present day. The term sterling is now disused in England in all ordinary transactions, but is still used in Scotland to distinguish sums from the ancient money of the country, as referred to in old deeds and notices of pecuniary transactions. The old Scots' money, previous to the Union of 1707, was in pounds, shillings, and pence, but these were only a twelfth of the value of sterling money of the same denomination; thus a pound Scots was only twenty pence sterling. The word sterling is also in use in the colonies, to distinguish the legal standard of Great Britain from the currency money in these places.

It is customary to estimate the purity of gold by an imaginary standard of 24 carats. If in a piece of gold weighing 24 carats there be 1-24th of alloy, then the piece is one below the standard. What is called jewelers' gold is seldom purer than 20 fine to 4 of alloy — the alloy being usually silver, but sometimes copper, which gives a deeper red tinge to the metal. Perfectly pure gold is never seen either in trinkets or coins, for it is too ductile, and for that and other reasons requires a certain quantity of alloy. Sovereigns, and other modern English gold coins, contain one twelfth of alloy, but this twelfth is not reckoned as gold in point of value. At present the gold coin of Great Britain is issued at very nearly its precise market value as bullion. A pound weight of gold of 22 carats fineness produces coins to the amount of 46 pounds, 14 shillings, and 6 pence, which is about the price at which bullion sells for in the market. Thus the gold of that country is coined free of expense. In coining silver, the government is allowed by the Act of 56, George III., a profit or seigniorage of about 6 per cent.; the pound weight of silver, which should produce 62 shillings, being coined into 66 shillings. The silver coins being therefore of a little less real value than the sums they represent, they are not liable to be melted down by silversmiths for the manufacture of articles in their trade.

AMERICAN COINAGE, EARLY.

The earliest coinage that can be called American, in the sense of Anglo-American, was ordered by the original Virginia Company only five years after the founding of Jamestown. The coin was minted at Somers Island, now known as the Bermudas. For a long while the standard currency of Virginia was tobacco, as in many of the early settlements of the Northwest it was beaver skins, and other pelts reckoned as worth such a fraction of a beaver skin or so many beaver skins. In 1645 the Assembly of the Virginia Colony, after a preamble reciting that "It had maturely weighed and considered how advantageous a quoin would be to this colony, and the great wants and miseries which do daily happen unto it by the sole dependency upon tobacco," provided for the issue of copper coins of the denomination of twopence, threepence, sixpence, and ninepence; but this law was never carried into effect, so that the first colonial coinage of America was that struck off by Massachusetts under the order of the General Court of that colony, passed May 27, 1652, creating a "mint house" at Boston, and providing for the mintage of "twelvepence, sixpence, and threepence pieces, which shall be for forme flatt, and stamped on the one side with N. E., and on the other side with xiid., vid., and iiii., according to the value of each pence." In 1662 from this same mint appeared the famous "pine tree shillings," which were twopenny pieces, having a pine tree on one side. This mint was maintained for thirty-four years. In the reign of William and Mary copper coins were struck in England for New England and Carolina. Lord Baltimore had silver shillings, sixpences, and fourpences made in England to supply the demand of his province in Maryland. Vermont and Connecticut established mints in 1785 for the issue of copper coin. New Jersey followed a year later. But Congress had the establishment of a mint for the confederated States under advisement, and in this same year agreed upon a plan submitted by Thomas Jefferson, and the act went into operation on a small scale in 1787. After the ratification of the Constitution of the United States in 1789 all the state mints were closed, as the Constitution specifically places the sole power of coining money in the Federal Government.

The gold pieces are:—

1. The double eagle, or \$20 piece. Coinage of the double eagle was authorized by the Act of March 3, 1849. Its weight is 516 grains. Its fineness is 900. (This technical form of expression means that 900 parts in 1,000 are pure metal, the other 100 parts are alloy.) The amount of coinage of the double

eagle is far greater than that of all the other gold pieces of the country.

2. The eagle, or \$10 piece. Its coinage was authorized by the Act of April 2, 1792. The weight was first established by law at 270 grains, but was changed forty-two years afterward, by the Act of June 28, 1834, to 258 grains, where it has remained ever since. Its fineness was in the beginning made 916 $\frac{2}{3}$, but was changed by the Act of June 28, 1834, the same act that lowered its weight, to 899.225. Two years and a half subsequently its fineness was increased—less than one part in a thousand—to 900. Its weight and fineness have remained thus fixed to the present day.

3. The half eagle, or \$5 piece. This elegant coin has undergone the same vicissitudes as the eagle. Its coinage was authorized by the same Act of April 2, 1792. Its weight was 135 grains, and its fineness 916 $\frac{2}{3}$. By the Act of June 28, 1834, its weight was reduced to 129 grains, and its fineness to 899.225. By the Act of January 16, 1857, its fineness was slightly raised to the uniform standard of 900. Its weight and fineness have thus remained to our time.

4. The quarter eagle, or \$2.50 piece. This fine coin belongs to the same family with the eagle and half eagle. Its coinage was authorized, its weight and fineness correspondingly altered, by the same acts. The statute of 1792 made its weight 67.5 grains and its fineness 916 $\frac{2}{3}$. Its weight was reduced to 64.5 grains and its fineness to 800.225 by the Act of 1834. The Act of 1837 raised its fineness to 900.

5. The dollar. This pretty little gold piece was created by the Act of March 3, 1849, the same act that authorized the coinage of the double eagle. It has remained unchanged. Its weight is 25.8 grains and its fineness 900.

6. Three-dollar piece. An Act of February 21, 1853, established this irregular coin. Its weight, 77.4 grains, and its fineness 900, are of the normal standard, and have not been changed by subsequent acts.

In gold coin the alloy was at first a compound of silver and copper. It was forbidden by statute that the alloy should be more than half silver. It is now nearly all copper, owing to advances in the art of assaying and improved methods in coinage.

There are four coining mints, located at Philadelphia, Pa.; San Francisco, Cal.; Carson City, Nev.; and New Orleans, La., the last one being put in operation on January 20, 1879. The largest proportion of assaying and refining is done at New York city; Helena, Montana; Boise City, Idaho; and Denver, Colorado.

The Philadelphia Mint is capable of turning out about \$1,500,000 in coined money a month; the San Francisco Mint, \$1,000,000; the Carson City Mint, \$500,000; and the New Orleans Mint about 500,000 pieces of various denominations. Under the law of February 28, 1878, which required that between 2,000,000 and 4,000,000 of the new ("Bland") dollars should be turned out by the mints every month, the coining facilities of the government were severely tested to produce this particular silver coin, and maintain the usual supply of gold and subsidiary coins. Silver is sent from the assay offices to the mints pure, or 999 fine, which is about as pure as silver can be. It is sent in large bars, and, when received at the mint, is melted and alloyed with copper. Coin silver is 900 fine.

The first silver coins were struck in 1794 (authorized in 1792), at the Philadelphia Mint, and consisted of 1,758 dollars, and 10,600 half dollars, and a few half dimes (5 cents), more for curiosities than use. In the succeeding year the issue was 203,033 dollars, 323,038 half dollars, no quarters, no dimes, and 86,416 half dimes. In 1796 the mint coined only 72,920 dollars, and 3,918 half dollars, with 2,948 quarters. In 1797 the number of dollars issued was 2,776, and the mint records state that there were no half dollars and only 252 quarters. Dollars only were coined in 1798. In 1796 the head of Liberty was changed, and a new head, inferior in point of comeliness, substituted. This also had flowing locks, but these were bound by a broad fillet, and hence the name "fillet dollars." In 1798 there were no halves nor quarters, and there were none in 1799, nor again in 1800. But in the following year the half dollars were commenced again, being of the fillet series, with the heraldic eagle on the reverse.

1804 is the *annus mirabilis* of the American silver coins. According to the records, 19,570 dollars were issued, 156,519 halves, and 6,738 quarters. There are but two dollars of 1804 known to exist, and these are said to have been struck surreptitiously from the original die at the Philadelphia mint in 1827. The value of these two to numismatians is enormous; as high as \$1,000 has been refused for one of them.

The first dollar pieces (1792) contained 416 grains of silver of 892.7 fineness, and this proportion was maintained until 1873, when the quantity of silver was reduced to 412.5 grains, and the fineness increased to 900. The fifty-cent pieces, from 1792 to 1837, contained 208 grains, 892.7 fineness, and the twenty-five cent pieces a proportionate amount; and both were

subjected to a reduction in number of grains and increase in fineness in 1878. The ten-cent pieces contained 41.6 grains, of standard fineness, and now bear 38.58 grains under the new standard of fineness. From 1851 to 1853, the five-cent pieces were composed of 12.375 grains, 750 fine, and from 1853 to 1873, when their coinage was abolished, 11.52 grains, 900 fine. The old copper cents, authorized in 1792, contained 264 grains; the next year the amount was reduced to 208, and three years later to 168. As a purely copper token this coin was abolished shortly after the last reduction in the number of grains. The two-cent piece of April, 1864, contained 96 grains of copper, zinc, and tin, and was discontinued in 1873. The half-cent pieces were established in 1792, containing 132 grains; this amount was reduced in 1793 to 104, and in 1796 to 84. None are coined now. An act of March, 1875, authorized the coinage of a silver twenty-cent piece, containing 77.16 grains, 900 fine. This coin being but a trifle smaller than the twenty-five cent piece, led to such a general confusion of the two, that in 1878 its coinage was stopped. But few are now found in circulation. The one-cent piece of present use was authorized in 1857, and consisted of 72 grains of copper and nickel, and in 1864 this composition was changed to 48 grains of copper, zinc, and tin. Finally, the five and three cent nickel pieces were authorized in 1866 and 1865 respectively; the latter has a comparatively small circulation.

The amount of standard silver dollars coined from February 28, 1878, to October 31, 1882, was \$128,829,880, of which \$93,006,382 remained in the Treasury, and \$35,823,498 was placed in circulation. Of the \$30,007,175 coined in the thirteen months preceding October 31, 1882, \$2,950,072 went into circulation, and \$27,057,103 remained in the Treasury.

The total value of the minor coin in the Treasury on September 1, 1882, was \$504,515.29. The supply of five-cent nickel coins in the Treasury, which three years previous reached the sum of \$1,184,252.95, had been exhausted, and their coinage was resumed by the mint. None of these coins are supplied by the Treasury, but the one-cent and five-cent pieces are furnished in multiples of \$20 by the mint, which bears the expense of their transportation.

BANKS.

The term bank, in reference to commerce, signifies a place of deposit of money, and is derived from the Italian *banca*, a seat or bench, because the early custodians and dealers in money in Italy used benches for money tables

in the market places of the principal towns. During the middle ages, in which commerce was but little developed, there could be no field open for banking as a business; but on the revival of business in the twelfth century, and when the cities of Italy engrossed nearly all the trade of Europe, the necessity arose again for the employment of bankers. The successful manufacturing efforts of the Florentines brought them into commercial dealings with different countries in Europe, and thence arose the establishment of banks as private concerns. The earliest public bank established in modern Europe was that of Venice, which was founded in 1171. About the year 1350, the cloth merchants of Barcelona, then a wealthy body, added the business of banking to their other commercial pursuits; being authorized so to do by an ordinance of the King of Aragon, which contained the important stipulation that they should be restricted from acting as bankers until they should have given sufficient security for the liquidation of their engagements. In 1401 a bank was opened by the functionaries of the city, which was both a bank of deposit and of circulation, the first of the kind ever established in Europe.

The Bank of Genoa was planned and partially organized in 1345, but was not brought into operation until 1407, when the numerous loans which the Republic had contracted with its citizens were consolidated, and formed the nominal capital stock of the bank. As security for its capital in the hands of the Republic, this bank, which was given the name of the Chamber of St. George, received in pledge the Island of Corsica, and several other dependencies of Genoa. Since 1800, when the French, besieged in Genoa, appropriated its treasure to the payment of their troops, the bank has had little other than a nominal existence.

The banks of note next established, of which records remain, were opened in Holland and in Hamburg. The most celebrated of these was the Bank of Amsterdam, established in 1609, simply as a bank of deposit, under the guaranty of the city. The credit given in the bank for foreign coin and the worn coin of the country was called bank money, to distinguish it from current money of the place; and as the regulations directed that all bills drawn upon or negotiated at Amsterdam, of the value of 600 guilders and upwards, must be paid in bank-money, every merchant was obliged to keep an account with the bank, in order to make his ordinary payments. The Bank of Hamburg was established in 1619, on the model of that of Amsterdam originally. Deposits were received only in bullion, and a

charge was made for their safe keeping. It advanced money on jewels up to three fourths of their value. The city was responsible for all deposits, which might be sold at auction if they remained eighteen months without payment of charges. If the value was not claimed within three years, the property in the deposits was lost, and passed to the poor fund of the city.

Next in point of date among these establishments is the Bank of England, which was opened in 1694. It was originally chartered for ten years, and the charter has since been prolonged, by various renewals, till August 1, 1879, and, from that date, subject to a year's notice. The Bank of England is, and always has been, the government bank, transacting for it all the banking business of the nation, receiving the produce of the taxes, loans, etc., and paying the interest of the public debt, the drafts of the Treasury, and other public departments, transferring stock, etc. For this service the bank receives, exclusive of the use of the balances of the public money in its hands, about £95,000 a year.

Down to 1797 the bank always had paid its notes on demand. But in 1796 and the early part of 1797, owing to rumors of a French invasion, there was a run made on the bank, and it was feared that a suspension was inevitable. In February, 1797, Mr. Pitt, apprehensive that he might not be able to obtain sufficient specie for foreign payments, in consequence of the low state of the bank reserve, procured the issue of an order in council, requiring the bank to suspend specie payments. The suspension lasted till 1823, and is known to writers on finance as "the period of the bank restriction." The bank's notes, however, continued to circulate, and a committee of the House of Commons reported soon after the suspension that the bank was not merely possessed of the most ample funds to meet all its engagements, but that it had a surplus stock, after the deduction of all demands, of no less than £15,513,000.

The Bank of England is the custodian of the reserves of the several London banks and private bankers. These deposited reserves are, for the most part, loaned out by the bank. Then, again, the reserves of the country banks, and of the Scotch and Irish bankers as well, are deposited with the great English banks, which, in their turn, keep their reserves at the Bank of England. Therefore the reserve in the banking department of the Bank of England is the banking reserve not only of the Bank of England but of all London, and not only of all London, but of all England, Ireland, and Scotland. The credit system of Great Britain depends upon the security of the Bank of England.

The Bank of Vienna, established in 1703 as a bank of deposit and circulation, became a bank of issue in 1793. This institution now does comparatively little commercial business, being recognized as a means of the government for managing the public debt and finances.

The Banks of Berlin and Breslau were founded in 1765 under the direct authority of the government. They are banks of deposit and issue, and also discount bills of exchange. In some important particulars the banking system of Germany resembles that of the United States, the Imperial Bank and its branches in nearly every town corresponding to the American chain of National Banks. The Imperial Bank enjoys an enormous monopoly of immunities and powers.

Russian Banks. During the reign of the Empress Catharine, three different banks were established in St. Petersburg: the Loan Bank, the Assignment Bank, and the Loan Bank for the nobility and towns. The first, opened in 1772, made advances upon deposits of bullion and jewels, and allowed interest upon all sums remaining for one year and over. At present the operations of this bank are carried on for the benefit of the Foundling Hospital in St. Petersburg. The Assignment Bank was opened in St. Petersburg in 1768, and in Moscow in 1770. It issues paper money, and is really an imperial institution. The Loan Bank, for the nobility and towns, advances money on real security, discounts commercial paper, and carries on an insurance business. In 1797 the Aid Bank was established for the purpose of advancing money to relieve estates from mortgages, and to provide for their improvement. There is also the Commercial Bank of Russia, whose capital is declared to be sacred by the government, and free from all taxes, attachments, and calls from the State. It has numerous branches throughout the empire, receives deposits of coin and bullion, discounts paper, and makes advances upon merchandise of domestic production.

The Bank of Stockholm was founded in 1688, when its direction was assumed by the Assembly of the States of the Kingdom of Sweden, and it became a bank of deposit, discount, and circulation. Since 1766, when the affairs of the bank fell to a very low state, and the Assembly assisted it with a large loan, a committee, composed of members of each of the three States, nobles, clergy, and burghers, is appointed triennially to inspect its condition, securities, and prospects.

The Bank of France, originally formed in 1800, was placed on a solid basis in 1806, when its capital was raised to 90,000,000

frances. The bank is now the only authorized source of paper money in France. Its charter and exclusive privileges have been conferred, varied, or continued by different governments and under various laws; the year 1897 was the time fixed at which the terms made with the bank by the public might be ended. The bank has branches scattered throughout all the departments. Besides discounting, the Bank of France advances upon deposits of stock and pledges of a miscellaneous kind. It also undertakes the safe custody of valuables. A council of twenty-one members conducts the direction of affairs, viz.: a governor and two sub-governors, who are to be nominees of the head of the government; fifteen directors and three censors, nominated by the shareholders.

UNITED STATES BANKS.

The first United States bank was established by Act of Congress, approved July 25, 1791. It was organized at Philadelphia, with a capital of \$10,000,000, divided into 25,000 shares of \$400 each. The act prescribed that any person, copartnership, or body politic might subscribe for any number of shares not exceeding 1,000—only the United States could subscribe for more than this number of shares; that with the exception of the United States the subscriptions should be payable one fourth in gold and silver, and the remaining three fourths in certain six per cent. bonds of the United States; that the subscribers should be incorporated under the name of "The President, Directors, and Company of the Bank of the United States," and the organization should continue until March 4, 1811; that the bank could hold property of all kinds, inclusive of its capital, to the amount of \$15,000,000; that twenty-five directors should be chosen, who in turn should choose from their number a President; that as soon as \$400,000 in gold and silver was received on subscription, the bank could organize, after giving a notice of its intention. The general effect of this institution was very salutary. The credit of the United States became firmly established. The bank notes stood at par with gold and silver. The large deposits made the money available for the use of the Treasury, and the State bank currency, which had flooded the country with no prospects of redemption, was greatly reduced. But with all its recognized advantages, the act to recharter was defeated in 1811 by the casting vote of the Vice-President, George Clinton. Its loss, however, was immediately felt in the sudden and rapid increase of the currency of the State banks. To ward off an impending crisis, a second bank was established by an act approved by President Madi-

son, April 10, 1816, at Philadelphia. A capital of \$35,000,000 was required, which was to be equally divided into 350,000 shares, of which the United States took 70,000. The charter extended to March 3, 1836. The bank was prohibited from lending, on account of the United States, more than \$500,000, or to any prince or foreign power any sum whatever, without the sanction of law first obtained; and it was also prohibited from issuing bills of less denomination than \$5. In time, to facilitate business, branch offices were established in every state. In December, 1829, however, the bank met strenuous opposition in the message of President Jackson, who argued, as did Jefferson when the first bank was started, against the constitutionality of its charter; and when Congress, in 1832, passed a bill to recharter the institution he imposed his veto, and soon after removed from the bank the United States deposits. The bank corporation, however, continued to exist until 1836, when the charter terminated.

Savings Banks.—These are banks for receiving and taking charge of small sums, the savings of industry, and were instituted for the benefit of workmen and others, who were able to spare a little from their earnings. It is believed that Quaker thrift in Philadelphia, Pa., led to the inception of the idea, and that the first savings bank in the world was founded in that city in 1816. As the scheme grew in popularity throughout the United States, guardians of minor children, administrators of estates of deceased persons, and other holders of trust funds, found the savings banks very serviceable as places of deposit for money that had to be laid away for a specified period of time. Hence, the exigencies of business transactions forced an innovation upon the original plan. In the United States this use of savings banks is still maintained; but during the past fifteen years safe deposit and trust companies have been numerous established for the special purpose of holding funds, both in trust and in legal dispute, besides securities of all kinds, jewelry, diamonds, and articles of like value. Thus a guardian, an administrator, or a society will invest money in Government, State, or City bonds, or, if permitted by the terms of trust, in real estate, or stock of various corporations, and place the bond, certificate of stock, or other acknowledgment of the indebtedness, with a safe deposit or trust company for safe keeping. The savings banks are allowed by law to invest their money in first-class securities only, so as to prevent their officers from using the fund in the irregular pursuit of "wild-cat" speculation.

VALUE OF FOREIGN COINS IN UNITED STATES MONEY.

(Proclaimed by the Secretary of the Treasury October 1, 1904.*)

| COUNTRY. | Standard. | Monetary Unit. | Value in U. S. Gold Dollar. | COINS. |

Wild-cat Banks.—The fraudulent institutions known as wild-cat banks were started principally in the West and South after the closing up of the United States Bank and the transfer of its deposits to State banks in 1832. The scarcity of capital in these regions made it comparatively easy to put in circulation anything that purported to be money. Hence, anyone with a very limited capital—or, in fact, without any capital at all—could open a bank, issue \$10,000 or more in small notes, and pass them over in easy loans to land speculators, who, in their turn, paid them out in country villages and among farmers, where the standing of the bank of issue would necessarily be unknown. Hundreds of these banks were started, and immense amounts of so-called money were loaned to build cities in the wilderness, and to contractors anxious to build railroads without material, tools, or means of paying wages. In some cases the real place of issue was, for instance, New Orleans or Buffalo, while the bills purported to be issued and pay-

able in, say, Georgia or Illinois. This method of doing business lasted four years, when the panic of 1837, one of the most painful and prolonged crises in the financial history of the United States, overtook the country. Fortunately this led to the adoption in nearly all the States of such banking laws as rendered similar schemes impossible in the future. These institutions were called wild-cat banks, owing to their utter lawlessness and because their victims were “most awfully clawed.”

Trade Dollars.—Previous to the coinage of this dollar, which was brought into existence through the demand on the Pacific coast for a coin to be used in commercial relations, particularly with China and Japan, the old silver dollar of 871½ grains was the only one known. The new dollar contained 420 grains, and eventually was extensively circulated all over the Union, but was retired after the Forty-fourth Congress enacted that it was not a legal tender.

Clearing House.—The clearing house is

an institution founded not merely upon the idea of saving time and trouble in the use of the precious metals, but also of circulating notes. The Clearing House of London, which was the first of the kind, originated among the bankers of that city, whose transactions in the checks, bills, and drafts drawn upon each other became so large as to call for the daily, and even hourly, use of vast sums in bank-notes by all of them. Appreciating how readily the debts and credits respectively due or held by them might be set off, one against the other, they formed the clearing house, where, up to four o'clock each day, all drafts, bills, etc., upon each individual member were taken. This system of the London Clearing House has, however, been much extended and improved. Clearing houses exist in New York, Philadelphia, Boston, Chicago, and other cities in the United States. A description of the system in use in Philadelphia will, in the main, answer for all. The clearings are made each morning at 8.30, just before which hour a messenger and a clerk from each bank are at the clearing house. The clerks take their seats at a series of desks arranged in the form of a half oval. The messenger brings with him from his bank a sealed package for each other bank, containing all checks or drafts on such banks. The name of the bank sending, and that of the bank to which it is sent, is printed on each package, and the amount sent is written thereon. The messengers take their places near the desks of their respective banks, and they have with them tabular statements of the amount sent to each bank, and the aggregate. These are exhibited to the respective clerks and noted by them on the blank forms. At 8.30 o'clock precisely, the manager calls to order and gives the word, when all the messengers move forward from left to right of the clerks, handing in to those clerks the packages addressed to their respective banks, and taking receipts for them on their statements. The several clerks then pass around a memorandum of the debts, credits, and balances, each of his respective bank. When these memoranda have made the circuit, each clerk has on his statement the debts, credits, and balances, whether debtor or creditor, of each bank. If these debts and credits, or debtor or creditor balances, are found to balance, the clerks now leave the clearing house. If not, they remain until the error or errors are discovered. The balances due by the several banks are paid into the clearing house that day by 11.30 o'clock A. M., and are receivable by the creditor bank by 12.30 P. M. Each bank is obliged daily to furnish to the clearing house a statement of its condition at the end of the

business on that day, and tables are daily furnished to the several banks of all the banks in the clearing house.

Freedman's Bank was established in March, 1865, as a charitable enterprise, to encourage frugality and thrift among the newly-liberated slaves. The institution was started at first in Washington, but afterward branch banks to the number of thirty-four were located in different parts of the Union. The bank was not intended to be a money-making concern, either for bankers or for depositors, but as a place of deposit for the savings of negroes, which savings were to be invested in the stocks, bonds, Treasury notes, and other securities of the United States. During the existence of the bank, nine years, it handled no less than \$58,000,000 of deposits, the negroes being led to believe that the safety of the institution was guaranteed by the Government, which was untrue. The institution was managed by a number of trustees of unsavory financial reputation, and, as a consequence, at the expiration of nine years it suspended payment. At the investigation which was made by a committee appointed by Congress a most scandalous condition of affairs was discovered. The regulations of the charter had been completely ignored, and the funds had been dissipated by loans made upon inadequate securities. By law the investments of the bank were confined to Government securities alone. Unimproved real estate, unsalable stocks and personal notes, were among the assets of the bank. Deficits and embezzlements at the branch banks also produced many losses. The unsecured debts owed to the depositors amounted to \$2,900,000, and the assets yielded about \$1,700,000. For some years three bank commissioners were employed, at a salary of \$3,000 each, to wind up the affairs of the institution. After \$475,000 had been expended in this "winding-up" process the affairs of the bank were all turned over to the Comptroller of the Currency. Dividends have been paid at various times; but many small depositors, through ignorance and despair, forfeited their dividends by not calling for them. In all, 77,000 dividends, amounting to \$112,000, were thus forfeited.

Revenues of the Government, year ending June 30, 1903:—

| | |
|-----------------------------------|------------------|
| From customs, | \$284,479,562.00 |
| From internal revenue, | 230,510,124.00 |
| From sales of public lands, | 11,024,744.00 |
| From other miscellaneous sources, | 84,082,224.00 |
| Total receipts, | \$609,896,674.00 |

Expenditures for the same period:—

| | |
|---------------------------------|------------------|
| For the civil establishment, | \$124,944,290.00 |
| For the military establishment, | 118,619,520.00 |
| For the naval establishment, | 82,618,984.40 |

| | |
|------------------------------|------------------|
| For Indian service, | \$12,935,168.00 |
| For pensions, | 138,425,646.00 |
| For interest on public debt, | 28,556,385.00 |
| Total expenditures, | \$506,099,007.00 |
| Showing a surplus of, | \$54,297,667.00 |

DIVISION OF LABOR.

The Statistical Yearbook for the German Empire, for 1903, gives the following figures with reference to the occupation of the population of different countries:—

| COUNTRY. | Agriculture. Per cent. | Industries. Per cent. | Commerce. Per cent. | Other Pursuits. Per cent. |
|-----------------|---------------------------|--------------------------|------------------------|------------------------------|
| German Empire. | 37.5 | 37.4 | 10.6 | 14.5 |
| Austria | 38 | 37 | 11 | 14 |
| Hungary | 64 | 22 | 6 | 8 |
| Italy | 57 | 28 | 4 | 11 |
| Switzerland | 37 | 41 | 11 | 11 |
| France | 44 | 34 | 9 | 13 |
| England, Wales. | 10 | 57 | 11 | 22 |
| Scotland | 14 | 58 | 10 | 18 |
| Ireland | 44 | 31 | 5 | 20 |
| Great Britain | 15 | 54 | 10 | 21 |
| United States | 36 | 24 | 16 | 24 |

With reference to the percentage of females employed, the United States stands first, with only 14.3 per cent., the Netherlands and Sweden coming next. In Germany the percentage of females employed to the total self-supporting population is 25, while in England it comes up to 27. In Italy the percentage is 40 and in Austria 47.

Trades Unions.—In one form or another, combinations have always existed since the employed and employing classes became distinguishable from each other. Trades unions, organized for purposes such as those which contemporary unions contend for, have existed for more than three centuries. So early as 1548 a statute of Edward VI. is directed, among other culprits, against certain “artificers, handicraftsmen, and laborers,” who had “sworn mutual oaths” to do only certain kinds of work, to regulate how much work should be done in a day, and what hours and times they should work. The usual penalties of fines, pillory, and loss of ears were to follow a breach of its enactments. Add the regulation of wages and the employment of union or non-union men to the objects enumerated in this statute, and we have in effect the trades unions of the present day. Many fruitless acts were afterward passed to prevent combinations for raising wages; but since that time the trades unions have increased in numbers and membership, until they include nearly all the laboring classes of England and America. The advocates of the unions insist that they are the only means by which workmen can defend themselves against the aggressions of employers. It is argued that the individual laborer has no chance of resisting the capital-

ist on equal terms; that starvation treads too closely on his heels to permit his successfully opposing a reduction of his wages, no matter how arbitrary or unjust. It is urged that associations of employers are practically universal, and that their object is mainly to secure for themselves the largest possible share of the profits which are the product of capital and labor united. What has probably been the greatest result of the trades union idea is the passage of laws looking to the welfare of the workman. There is scarcely a state in the Union that has not statutes providing for the hours of labor, the sanitary conditions of workshops, the liability of employers, the age limit for the employment of children. The public is beginning to understand that better conditions for workmen mean better communities, more schools, and more intelligence. Organization of labor has undoubtedly had an effect in maintaining wages.

Mississippi Scheme.—The gigantic commercial scheme commonly known by this name was projected in France by the celebrated financier John Law of Edinburgh in 1717, and collapsed in 1720. Its primary object was to develop the resources of the Province of Louisiana and the country bordering on the Mississippi, a tract at that time believed to abound in the precious metals. The company was incorporated in August, 1717, under the title of the “Company of the West,” and started with a capital of 200,000 shares of 500 livres each. They obtained the exclusive privilege of trading to the Mississippi, farming the taxes and coining money. The prospectus was so inviting that shares were eagerly bought; and when, in 1719, the company obtained the monopoly of trading to the East Indies, China, and the South Seas, and all the possessions of the French East India Company, the brilliant vision opened up to the public gaze was irresistible. The “Company of the Indies,” as it was now called, created 50,000 additional shares; but a rage for speculation had seized all classes, and there were at least 300,000 applicants for the new shares, which consequently rose to an enormous premium. Law, as director general, promised an annual dividend of 200 livres per share, which, as the shares were paid for in the depreciated *billets d'état*, amounted to an annual return of 120 per cent. The public enthusiasm now rose to absolute frenzy, and Law's house and the street in front of it were daily crowded by applicants of both sexes and of all ranks, who were content to wait for hours—nay, for days together—in order to obtain an interview with the modern Plutus. While confidence lasted a factitious impulse was given to trade in

Paris, the value of manufactures was increased fourfold, and the demand far exceeded the supply. The population is said to have been increased by hundreds of thousands, many of whom were glad to take shelter in garrets, kitchens, and stables. But the Regent had meanwhile caused the paper circulation of the National Bank to be increased as the Mississippi scheme stock rose in value, and many wary speculators, foreseeing a crisis, had secretly converted their paper and shares into gold, which they transmitted to England or Belgium for safety. The increasing scarcity of gold and silver becoming felt, a general run was made on the bank. The Mississippi stock now fell considerably, and despite all efforts it continued to fall steadily and rapidly. In 1720 the National Bank and the Company of the Indies were amalgamated; but, though this gave an upward turn to the share market, it failed to put the public credit on a sound basis. The crisis came at last. In July, 1720, the bank stopped payment, and Law was compelled to flee the country. The French Government was nearly overthrown, and widespread financial distress and bankruptcy were occasioned.

Credit Mobilier.—The Credit Mobilier of America was a joint stock company organized in 1863 for the purpose of facilitating the construction of public works. In 1867 another company, which had undertaken to build the Union Pacific Railroad, purchased the charter of the Credit Mobilier, and the capital was increased to \$3,750,000. In 1872 a lawsuit in Pennsylvania developed the startling fact that much of the Credit Mobilier was owned by members of Congress. A suspicion that those members had voted corruptly in the legislation affecting the Pacific Railway at once seized the public mind, and led to a Congressional investigation, in the course of which many scandalous transactions were brought to light, and the reputation of many public servants suffered greatly. The investigation showed that some of the members of Congress who had this stock in their possession had never paid for it; in other words, that their votes had probably been obtained by giving them stock. In other cases it was shown that persons whose integrity could not be questioned had been reported as stockholders, for the purpose of influencing others to subscribe or to regard the project favorably. The report of the committee exonerated many whose names had been used without authority in connection with the scheme. Owing to the profitableness of the work in which the company was engaged, the stock rose rapidly in value previous to the investigation, and enormous dividends were paid to the shareholders.

Boycott and Boycotting.—The origin of the term "Boycotting" was as follows: A Captain Boycott was the agent of a land owner in Ireland. His policy proved to be distasteful and offensive to the tenants, and such was their feeling in the matter that they asked the landlord to remove him. This was refused, and in retaliation the tenants and their friends refused to work for or under Boycott. They would not harvest his crops, and they made an agreement among themselves that none of them or theirs should assist or work for him in the harvest. His crops were endangered, when relief arrived in the person of certain Ulster men, who, under the protection of troops, harvested the crops of Boycott. The defensive league of the tenantry was much more powerful and effective than might be supposed from the single instance of the combination referred to above. The ramifications of their compact were very numerous and extensive. For example, if anyone had dealings with Boycott or those who represented him, then no one was to have any dealings with that person. If a man worked for Boycott he was looked upon by his old friends and neighbors as a stranger—no one would sell to or buy of him, no one was to know him. The effect of this agreement when carried to this extent was just what its authors proposed, and "Boycotting" has become a very forcible phrase.

Debt, Imprisonment for.—During late years the laws of most countries bearing upon imprisonment for debt have been greatly modified. In England the old harsh laws concerning debtors, which made the issuance of 101,000 writs for debt in one year, 1825, possible, were abolished in 1838; and in 1869, by the passage of the "Debtors' Act," still more lenient regulations were adopted. Imprisonment is still possible there, in certain cases, as when it is believed a debtor intends leaving the country, or when a debtor refuses, when he is able, to settle a claim decided against him by the courts, or when there is palpable evidence of premeditated fraud. The imprisonment cannot continue, however, longer than a specified time—usually one year. Imprisonment for debt was abolished in France by a decree of March 9, 1793, was re-enacted several years later, was again abolished in 1848, and was again re-established the same year. Since that time, however, the law has been greatly modified, and now imprisonment is permitted for a limited period only, and certain classes are exempted from the law; as, for instance, those under twenty years or over seventy years of age, ecclesiastics, and women not engaged in commerce. In France, as in most all continental countries, the entire cession of the prop-

erty of the debtor to his creditors will procure immunity from personal process, even though it may not cover the amount owed. New York was the first state in the United States to abolish imprisonment for debt. This was done in 1831, and the example was shortly followed by the other states; and though there is great difference in the insolvent laws of the several states, they all permit debtors their freedom, except in cases wherein dishonesty or speculation render the debtor also amenable to the Penal Code. Both in Greece and in Rome, in ancient times, the creditor had a claim to the person of the debtor. In Rome, thirty days after judgment was pronounced against the debtor, he was given into the hands of his creditor, who kept him sixty days in chains, exposing him on three market-days, and proclaiming his debt. If no one stepped in to release him, the debtor, at the end of that time, might be sold for a slave or put to death. If there were several creditors, the letter of the law permitted them to cut their debtor in pieces, sharing him in proportion to their claims. The common practice, however, was to treat him as a slave, and make him work out the debt. The children in his power, in accordance with the constitution of society at Rome, followed his condition.

American Mine, Oldest.—The first recorded account of the discovery of coal in the United States is contained in Hennepin's narrative of his explorations in the West, between 1673 and 1680, when he saw the coal outcrop in the bluffs of the Illinois river, not far from Ottawa and La Salle. In New Mexico and Arizona, there are silver mines which were operated by the Toltecs and Aztecs years before the Spanish invasion. So there are copper mines in the Lake Superior region in which the tools and mining marks of ancient miners of prehistoric times were found by the pioneers of the present American mining companies. Where the first colonists of Virginia got the ship load of "fool's gold" which they sent back to England, to the great disgust of the London Company, is not certainly known; but it is known that at the same time, in 1608, they shipped a quantity of iron from Jamestown, which yielded seventeen tons of metal—the first pig-iron ever made from Ameri-

can ore. In North and South Carolina, and Georgia, there are diggings, now overgrown with forests, which are supposed to have been excavated by the followers of De Soto and his immediate successors between 1539 and 1600. The oldest mining enterprise of the United States, still active, is generally conceded to be the mine La Motte, in the lead district of Eastern Missouri, which was opened about 1720 under Renault, of Law's notorious Mississippi Company. It was named after La Motte, the mineralogist of the expedition, and has been worked at intervals ever since it was opened.

Liverpool Docks.—The docks, at Liverpool, England, extend on the city side of the river Mersey $6\frac{1}{2}$ miles, and have a water area of $333\frac{1}{2}$ acres, and a lineal quayage of 22 miles. The great landing stage at Liverpool is the finest structure of the kind in the world. It was originally built in 1857, and was greatly enlarged in 1874, but shortly after its completion, July 28, 1874, it accidentally caught fire and was entirely consumed. It was again built in the most substantial manner. Its length is 2,063 feet, and its breadth is 80 feet. It is supported on floating pontoons, which rise and fall with the tide, and is connected with the quay by seven bridges, beside a floating bridge 550 feet in length for heavy traffic. The great system of docks at Liverpool was commenced by the corporation in 1709, and was for a century under the control of the City Council, but since 1856 their management has been in the hands of a board. The amount of capital invested in these docks is £10,000,000, of which £7,000,000 is in Liverpool proper, and the revenue derived from them is over £1,250,000 annually. They are constructed as water-tight inclosures, with flood gates, which are opened during the flowing and closed during the ebbing of the tide, so that vessels within can be kept afloat and at the same level while being loaded and unloaded.

Communism and Socialism.—Communism is the doctrine that society should be reorganized on the basis of abolishing individual ownership of property and control of wages, and most of the now generally admitted rights of individuals in their private and domestic relations, and substituting therefor community ownership and control of every person and everything. Attempts to realize Communism have been made in both England and France, but in all cases resulted in disaster to the communities. The communistic leader in England was Robert Owen, who made two attempts to carry out his views in that country. Fourier and St. Simon, French Communists, made similar efforts in France, but the results were

not more fortunate. A community of St. Simonians established a college or corporation at Menilmontant, with a "supreme father" at their head. The leaders were brought to trial by Louis Philippe on a charge of undermining morality and religion. They were subjected to imprisonment, and not having public feeling with them, they were unable to bear up against contumely thus thrown on them. Socialism is a sort of limited Communism. It would not entirely abolish individual rights of all, but would make such rights subordinate to the common good, and in a manner limit them to it.

Locomotives, weight and cost.—The average weight of the locomotive engines now on the standard gauge roads is from seventy to one hundred tons. As locomotives are now built, anything above eighty tons would be considered heavy, although there have been locomotives built weighing one hundred and fifteen tons, exclusive of tender. The cost of a locomotive for the standard gauge roads is about \$15,000. It is usually computed by railroad men that in weight and cost narrow gauge locomotives are from one third to one half less than those of the standard gauge lines.

Fur Trade, American.—The Northwest Fur Company, a British organization, practically controlled the fur industry along the great lakes and westward at the beginning of this century. A rival company, composed of American and French, and called the Mackinaw Fur Company, was formed about that time; but the importance of the American fur trade is undoubtedly due to the commercial genius of John Jacob Astor. In 1783 Mr. Astor landed in America with a few hundred dollars' worth of musical instruments, which he immediately exchanged for furs. This action was brought about through a conversation with a furrier during the voyage, who impressed upon the young emigrant the great profit to be gained in the fur traffic. From that time until 1809 he made repeated visits to the scattered settlements of western New York and Canada for the purchase of furs, and did much business with the Northwest Fur Company. All direct trade between the United States and Canada was then forbidden by laws of the British Government; hence furs purchased in the latter had first to be taken to London before they could be brought to New York. These restrictions on trade with Canada were removed by treaty in 1794. In 1809 the American Fur Company, an organization with \$1,000,000 capital, was granted a charter by the New York Legislature, and it was generally understood that the capital for this enterprise was furnished by Mr. Astor—in

fact that he was the company. In 1811 Mr. Astor, in connection with certain parties formerly connected with the Northwest Fur Company, purchased the Mackinaw Fur Company and merged it, with the American Fur Company, in another organization known as the Southwest Fur Company. Four years later, 1815, Mr. Astor bought all the shares of this company and pushed the American Fur Company to the front again, and in the same year succeeded in having a bill passed through Congress excluding all foreigners from taking any part in the fur trade of the United States—thus securing at one stroke a monopoly of the business. From that time he accumulated enormous wealth.

Gold Exports.—When this country buys abroad more than it sells abroad it must pay the difference, which is called the balance of trade, in sterling exchange. The par value of sterling exchange is \$4.867, that is, a pound sterling is worth \$4.867 in United States gold. The price or demand of sterling exchange varies according to the supply and demand of bills drawn against London. If we have made heavy shipments to London, or if Europe has been a heavy buyer of our securities, there is plenty of sterling exchange in the market, and it can be bought below its par value. When we have made heavy imports from Europe, or when Europe has been a heavy seller of our securities, or when American travelers have spent a large amount of money in Europe, the supply of sterling exchange is limited and its price rises. If the price of sterling bills is as high as \$4.88½ it is just as cheap to ship gold bars to London and pay the expenses of the shipment as it is to buy the exchange. If sterling exchange is \$4.89½ gold coin can be shipped without loss. If rates go higher, as, for instance, to \$4.90, gold coin or bars can be shipped at a good profit and exchange sold against them. When the rate of sterling exchange falls to \$4.83½ gold can be imported from London without loss, and if it goes lower it can be imported with a profit.

The South Sea Bubble.—The "South Sea Bubble," as it is generally called, was a financial scheme which occupied the attention of prominent politicians, communities, and even nations in the early part of the eighteenth century. Briefly, the facts are: In 1711, Robert Hartley, Earl of Oxford, then Lord Treasurer, proposed to fund a floating debt of about £10,000,000, sterling, the interest, about \$600,000, to be secured by rendering permanent the duties upon wines, tobacco, wrought silks, etc. Purchasers of this fund were to become also shareholders in the "South Sea

Company," a corporation to have the monopoly of the trade with Spanish South America, a part of the capital stock of which was to be the new fund. But Spain, after the treaty of Utrecht, refused to open her commerce to England, and the privileges of the "South Sea Company" became worthless. There were many men of wealth who were stockholders, and the company continued to flourish, while the ill success of its trading operations was concealed. Even the Spanish war of 1718 did not shake the popular confidence. Then in April, 1720, Parliament, by large majorities in both houses, accepted the company's plan for paying the national debt, and after that a frenzy of speculation seized the nation, and the stock rose to £300 a share, and by August had reached £1,000 a share. Then Sir John Blunt, one of the leaders, sold out, others followed, and the stock began to fall. By the close of September the company stopped payment, and thousands were beggared. An investigation ordered by Parliament disclosed much fraud and corruption, and many prominent persons were implicated, some of the directors were imprisoned, and all of them were fined to an aggregate amount of £2,000,000 for the benefit of the stockholders. A great part of the valid assets was distributed among them, yielding a dividend of about 33 per cent.

Trusts.—A "Trust," in its broad sense, is a combination of individuals or corporations for controlling the price of a commodity. It seeks to do this by restricting production or by "cornering" the market, and strives to accomplish its end without incurring the penalties of the law. This endeavor to keep within the law has given rise to many forms of "trust" agreements. The simplest is a mere naked contract between manufacturers or dealers that each shall carry on his business in his own way, but that none shall sell below an agreed minimum price. Examples of this are agreements between the coal producers of Pennsylvania and the trades union agreements. Another simple form of combination is an agreement that all shall carry on their business independently, but that profits shall all be turned into a common fund and divided in a definitely agreed on ratio, no matter what the profits of each individual may actually have been. Of such a nature are railroad pools. Another kind occurs when a corporation leases the works, or contracts to take all the products of other corporations, or enters into partnership with them. In all of these cases, however, there is a danger of overstepping the bounds of legality. Courts in all parts of the country have repeatedly refused to enforce such contracts if deemed to be injurious to the pub-

lic; and some authorities have declared them criminal, if dangerous to the common good. This has led to the invention of a subtle and elusive form which we may call the "Trust" proper. In this, the stock of all the stockholders of all the corporations comprising it is placed in the hands of a few men as trustees, thus securing to a dozen or so persons the absolute control of stock representing many millions of dollars and possibly thousands of owners. The Standard Oil Trust and the Sugar Trust were of this form, the Standard Oil being probably the pioneer in this line, and now one of the most powerful moneyed institutions in the world. This Trust in 1892 was declared illegal by decision of the Supreme court of Ohio, and became a "trust in liquidation." This proving a subterfuge for maintaining the organization in its original form, in 1898, upon threat of the same court to take away the charters of four of its important constituent companies, the Standard became a corporation under the laws of New Jersey, governed by fourteen directors.

Strikes, Statistics.—The plan of settling labor difficulties by strikes is a very old one. The first strike of the modern kind in the United States occurred in New York city, in 1802, when a number of sailors struck for an advance of wages. According to the U. S. Bulletin of Labor, Sept., 1904, between 1881 and 1900, 22,739 strikes occurred in the United States, in which 117,509 establishments were involved, and by which 6,105,694 employees were thrown out of work. The average duration of these strikes was 28.8 days; the total wage loss is given at \$257,863,478, and the loss of employers at \$122,731,121. Of these strikes 63.4% were ordered by labor organizations, that is 14,457, of which 52.8% were wholly successful, 13.6% partially so, and 33.5% failed. Of the 8326 strikes not so ordered only 85.56% were successful, 9.05% partially so, and 55.39% failed. The number of lockouts between 1881 and 1900 was 1005.

During the past few years almost every phase of labor has been organized and strikes have greatly multiplied. Many recent strikes have been national in their effects.

May 12, 1902, began the great coal strike in Pennsylvania, the most disastrous and far-reaching in effect on record. The strike lasted five months involving 147,000 men with a loss in wages of thirty to forty million dollars. Millions of people were affected by the shortage of coal, increasing their fuel bills from 50 to 150 per cent.

Watering Stock.—The credit of having originated the process of watering the stock of railroad companies belongs unquestionably to

the late Commodore Vanderbilt. The plan of operation is simple, and consists only in estimating the stock of the road at a figure greatly above its real value. For instance, when Commodore Vanderbilt secured control of the New York Central as well as the Hudson River Railroad in 1868, the combined stock of the two roads was only about \$36,000,000. Early in the following year he declared a tremendous dividend of new stock to the stockholders, and raised the estimated value of the two roads to \$90,000,000. This action of Vanderbilt was for the purpose of evading a law of the State of New York which provided that when the dividends of any railroad corporation should reach 10 per cent. the state could declare how the surplus above the 10 per cent. should be applied. This provision, it is plain, was rendered nugatory by Vanderbilt's scheme, as, if a railroad can at any time declare stock dividends with no reference whatever to the costs of construction and repair, a dividend of 10 per cent. may never be declared, though the road may be actually earning 80 or 40 per cent. upon its actual cost.

India Rubber.—This is mostly obtained from the Seringueros of the Amazon, who sell it for about 12 cents a pound to the merchants of Para, but its value on reaching England or the United States is over 50 cents a pound. The number of tons imported into Great Britain and the United States has been as follows:—

| | 1860. | 1870. | 1880. | 1887. |
|--------------------|-------|-------|-------|--------|
| United States..... | 1,610 | 4,318 | 7,529 | 12,900 |
| Great Britain..... | 2,150 | 7,606 | 8,479 | 11,800 |

The best rubber forests in Brazil will ultimately be exhausted, owing to the reckless mode followed by the Seringueros or tappers. The ordinary product of a tapper's work is from 10 to 16 pounds daily. There are 120 india rubber manufacturers in the United States, employing 15,000 operatives, who produce 280,000 tons of goods, valued at \$260,000,000, per annum.

How the Price of Southern Confederate Money Dropped.—When the first issue of the Confederate money was scattered among the people, it commanded a slight premium. It then scaled down as follows: June, 1861, 90c.; December 1, 1861, 8 c.; December 15, 1861, 75c.; February 1, 1862, 60c.; February 1, 1863, 20c.; June, 1863, 8c.; January, 1864, 2c.; November, 1864, 4½c.; January, 1865, 2½c.; April 1, 1865, 1½c. After that date, it took from \$800 to \$1,000 in Confederate money to buy a one-dollar greenback.

Facts about Gold and Silver.—A ton of gold or silver contains 29,166.66 ounces.

A ton of gold is worth \$602,875; silver, \$37,704.84.

The United States money standard for gold and silver is 900 parts pure metal and 100 parts of alloy in 1,000 parts of coin.

The value of an ounce of pure gold is \$20.67; 23.22 grains of pure gold equals \$1.

The term carat when used to distinguish fineness of gold means one twenty-fourth; pure gold is 24-carat gold.

A cubic foot of gold weighs 1,203 pounds, and is worth about \$361,808.

In round numbers the weight of \$1,000,000 in standard gold coin is 1½ tons (3,685 lbs.); standard coin, 26½ tons; subsidiary silver coin, 25 tons; minor coin, 5-cent nickel, 100 tons.

Glossary of Mining and Milling Terms.

Battery—Generally applied to a set of five stamps.
Bullion—Ingots of gold or silver ready for the mint.
Bumping-table—A concentrating table with a jolting motion.
Cage—A mine elevator.
Chute—A body of ore, usually elongated, extending downward within a vein; a slide for ore or waste rock.
Cobbing—Breaking ore for sorting.
Concentrator—Machine for removing waste matter from mineral.
Copper plates—Plates of copper coated with quicksilver, upon which the gold is caught as the ore flows from the stamps.
Cord—A cord weighs about eight tons.
Country-rock—The rock on each side of a vein.
Crevice—A fissure, split, or crack; the vein is called "the crevice."
Cribbing—The timbers used to confine wall rock.
Cross-cut—A level driven across the course of a vein.
Deposit—Ore bodies not confined to a lode.
Drift—A tunnel; a horizontal passage underground.
Dump—A place of deposit for ore or refuse.
Feeder—A small vein joining a larger one.
Fissure-vein—A crack or cleft in the earth's crust filled with mineral matter.
Float—Loose ore or rock detached from the original formation.
Fume—A pipe or trough to convey water.
Foot-wall—Layer of rock beneath the vein.
Free milling—Ores containing mineral that will separate from the gangue by simple methods.
Hanging-wall—The layer, or rock, or wall, over a lode.
Ladderway—That part of mine shaft containing the ladders.
Lapping—Timbers over and upon the sides of a drift.
Ledge or Lead—Mineral ores or gangue within fissure veins.
Mill-run—A test of the value of a given quantity of ore.
Ores—Compound of metals with oxygen, sulphur, arsenic, etc.
Pagetreack—The richest streak in the vein.
Pocket—A rich spot in the vein or deposit.
Refractory—Resisting the action of heat and chemical re-agents.
Shaft—A well-like passage into a mine.
Sluice—Troughs in which ore is washed.
Smelting—Reduction of ores in furnaces.
Spur—A branch of a vein.
Stamps—Weights for crushing ores.
Slope—The part of a vein above or below the drift from which the ore has been removed.
Stoping—Excavating the ore from the roof or floor of a drift.
Stratum—A bed or layer.
Stulls—A framework to support the rubbish when stoping.
Sump—A well at the bottom of a shaft to collect water.
Tailings—The refuse left after washing ores containing metals not saved in the first treatment.
Tunnel—A level driven across a vein.
Wagon—A machine used for raising ore or refuse.
Winze—An interior shaft sunk from one level to another.

Harvest Months of the World.

JANUARY.—The greater part of Chile, portions of the Argentine Republic, Australia, and New Guinea.

FEBRUARY TO MARCH.—The East Indies.

APRIL.—Mexico, Egypt, Persia, and Syria.

MAY.—Japan, China, Northern Asia Minor, Tunis, Algiers, Morocco, and Texas.

JUNE.—California, Spain, Portugal, Italy, Sicily, Greece, and some of the southern departments of France.

JULY.—The larger part of France, Austria, Southern Russia, and the larger part of the United States of America.

AUGUST.—Germany, England, Belgium, Netherlands, part of Russia, Denmark, part of Canada, and the Northeastern States of America.

SEPTEMBER.—Scotland, the larger part of Canada, Sweden, Norway, and the north midlands of Russia.

OCTOBER.—The northern parts of Russia and the northern parts of the Scandinavian peninsula.

Wine Production of the World.—The average production of wine in the prin-

pal vine-growing countries of the world is as follows: France, 765,175,972 imperial gallons; Algeria, 722,000,000 imperial gallons; Italy, 605,000,000 imperial gallons; Spain, 484,000,000 imperial gallons; Austria-Hungary, 187,000,000 imperial gallons; Portugal, 88,000,000 imperial gallons; Germany, 81,290,000 imperial gallons; Russia, 77,000,000 imperial gallons; Cyprus, 35,200,000 imperial gallons; Switzerland, 28,600,000 imperial gallons; Greece, 28,600,000 imperial gallons; United States, 18,000,000 imperial gallons; Turkey, 22,000,000 imperial gallons; Cape of Good Hope, 15,400,000 imperial gallons; Roumania, 15,400,000 imperial gallons; Servia, 11,000,000 imperial gallons; Australia, 1,933,800 imperial gallons; total, 2,485,599,772 imperial gallons.

Estimate made by the Russian Ministry of Finance.

The rye crop of principal countries, in bushels: United States, 23,996,000; Germany, 336,624,000; Austria-Hungary, 107,500,000; Russia in Europe, 903,931,000; France, 63,546,000; Japan, 35,000,000; the world, 1,601,826,000.

The barley crop of the world, in bushels, was 919,224,000; corn crop, 2,735,090; oats crop, 3,065,497,000.

ANIMAL, VEGETABLE, AND MINERAL PRODUCTIONS.

With the Names of the Countries Producing Them.

Agates—Africa and several parts of Europe, but chiefly Iceland, Saxony, and Tuscany.

Alabaster—Spain, Italy, England, America.

Alcanet (root)—Imported from the Levant, or the neighborhood of Montpellier in France.

Alligator—North America, South America, and the northern part of Africa.

Almonds—Spain, France, Italy, the Levant, Arabia, Asia, Africa. Indigenous to Greece.

Aloes—America, the West Indies. The medicinal Aloes are indigenous to India, Africa, and Italy.

Amber—In mines in Prussia, near the seacoast; on the shores of Sicily and the Adriatic; on the southern shores of the Baltic and eastern shores of England; Mexico.

Amethyst—Sweden, Bohemia, Saxony, and other parts of Europe; Siberia, India (Ceylon), Mexico, Brazil.

Anchovy—The Mediterranean (chiefly off Gorgona), off the coast of Spain, France, and Italy; and occasionally off those of England.

Anise Seeds—Egypt, to which they are indigenous; Syria and other Eastern countries; Spain, Malta, America.

Ant-Bear—South America (Brazil, Guiana), East Indies, and Cape of Good Hope.

Antelope—Europe, Asia, Africa, Arabia.

Apes—Asia (the East Indies), and Africa.

Armadoillo—Mexico, South America.

Arnetio—South America, East Indies, West Indies.

Arrack (a spirituous liquor)—Batavia, from rice; Coo, from the juice of the cocoa tree.

Arrowroot—East Indies, South America, West Indies.

Arsenic—Great Britain, Saxony, Bohemia, Hungary, Mexico.

Asafetida (a kind of gum)—Persia.

Asbestos (an incombustible kind of earth)—The Ural and some other European mountains; Swedish Lapland, Candia, China, North America.

Asphaltum (a friable kind of bitumen)—The Dead Sea, many parts of Europe and America, the island of Trinidad.

Baboons—Asia (Borneo and the Philippine Islands), and the hot parts of Africa.

Bamboo Cane—The East Indies, China, West Indies and America.

Banana—Egypt and the West Indies, and other tropical countries.

Barilla (an alkaline salt, used in making glass)—Spain and other parts of Europe, South America, West Indies.

Bear—The northern parts of Europe, Asia, Arabia, Egypt, Barbary, Japan, Ceylon, North America, Peru.

Beaver—The north part of Europe, Asia, and America.

Bergamot (a perfume)—Bergamo, in Italy.

Beryl (a gem)—Siberia, Dauria, on the frontiers of China, Saxony, south of France, North America, Brazil.

Betel (a shrub, whose leaf is chewed)—The East Indies.

Bird of Paradise—The islands of Papua and Doo.

Bison—Poland, Lithuania and North America.

Black Bear—India, Africa, America, Kamchatka.

Black Eagle—Abyssinia.

Black Fox—The north of Europe, Siberia, North America.

Black Swan—Botany Bay.

Boa Constrictor—Africa, South America, India.

Box Wood—Spain, Turkey, America.

Brandy—France, (chiefly in Cognac and Nantes); also in England, Spain, and the United States, but of inferior quality.

Brazil-Wood—Brazil (Pernambuco) and other parts of America; the East Indies.

Bread-Fruit—Otaheite and other South Sea Islands.

Buffalo—Asia, Africa, America.

Burgundy Wine—France.

Calabash Tree—The East Indies, America, West Indies.

Camel—Tartary, Siberia, Thibet, China.

Camelopard—Africa, Senaar, Abyssinia, Ethiopia, and the neighborhood of the Cape of Good Hope.

Camphor (a vegetable product)—China, Japan, and the East India Islands, Borneo, and Ceylon.

Canary Birds—Africa, the Canary Islands, Italy, and Greece.

Cantharides (a kind of beetle used in making blisters)—Spain, Italy, and south of France.

Cape Madeira Wine—The Cape of Good Hope.

Capers (the buds of a plant)—The south of France, Italy, and the Levant.

Capsicum (a pepper plant)—East Indies, Mexico, South America, West Indies.

Caraway Seeds—England, America.

Cardamom Seeds—East Indies (Malabar).

Carmine (a color prepared from cochineal)—East Indies, Mexico, South America.

Cassada (an edible root)—South America and the West Indies.

Cassia (an aromatic bark)—China, East Indies, South America, West Indies.

Castor Oil (from the seeds of a species of palm)—The East Indies, South America, West Indies.

Cat's-Eye (a kind of gem)—Ceylon, Siberia, America.

Catechu (a vegetable extract)—East Indies, Bombay, Bengal.

Caviare (a food made from the roes of sturgeon)—Russia.

Cedar—Syria, chiefly about Mt. Libanus; America.

Cayenne Pepper—East Indies, South America, West Indies.

Chameleon—Egypt and Barbary, India, Mexico, Guiana.

Chamois Goat—The Alps and Pyrenees.

Champagne Wine—France, United States.

Chestnut—Italy, France, Spain, Portugal, America.

Chigger (a species of flea that breeds under the skin)—South America.

Chinchilla (fur)—Chile.

Chocolate (Cacao)—Mexico, South America. West Indies.

Cinnabar (a red paint)—The palatinate of Germany, Bohemia, Almaden in Spain, and India.

Cinnamon—The East Indies, chiefly Ceylon; South America (Guiana).

Citron—Europe (Italy), Asia, West Indies.

Civet (an animal perfume)—Africa (coast of Guinea), Luia, Brazil.

Claret Wine—The neighborhood of Garonne on the western coast of France; United States.

Cloves—The Molucca Islands (chiefly Amboyna); the Isles of France and Bourbon; South America (Cayenne).

Cochineal (an insect used in dyeing and painting)—The East Indies, Mexico, South America.

Cockatoo—East Indies, and the Islands of the Indian Ocean; Banda, Ceram, the Philippines, and Sunda Isles.

Cocoanut—The East Indies, Arabia, Africa, South America, West Indies.

Cockroach (a kind of beetle)—Asia, America, West Indies.

Coffee—Arabia (Mocha), East Indies, West Indies, South America.

Condor (a bird of prey)—South America.

Constantia Wine—Constantia Farm, at the Cape of Good Hope.

Copal (a kind of resin)—Africa (Guinea), and America.

Copper—Anglesea and Cornwall, Sweden, Norway, Iceland, the Faroe Islands, and various parts of the continent of Europe, China, and Japan; Southern Africa, United States, Peru, and Chili.

Coral (a marine animal production)—The Mediterranean (about Sicily, Majorca, and Minorca), the Red Sea; off the coasts of Africa and America; in the South Seas.

Coriander Seed—South of Europe; England and America.

Cork—Portugal, Spain, and other parts in the south of Europe; Sicily (on Mt. Etna), the shores of the Mediterranean, South America.

Cornelian—The East Indies, Arabia, Egypt, various parts of Europe, several of the British shores, America.

Cotton—The Levant, Egypt, the East Indies, South America, United States, West Indies. The finest now produced is the Sea Island Cotton of Georgia, South Carolina, and Florida.

Crocodile—Africa (the rivers Nile and Senegal, and all the rivers of Guinea); India (the Ganges).

Crystal (a kind of gem)—Madagascar, South America (Brazil, Guiana), North America, Norway, the Alps, Scotland.

Currants—The Islands of the Grecian Archipelago, England, and the United States.

Cypress—The east of Europe, the Levant, Asia, America.

Dates—Egypt, the African coast of the Mediterranean, Arabia, the East Indies, Persia, Spain, and Italy.

Diamonds—The East Indies (Golconda, Raolconda, Borneo), Mexico, Brazil, South Africa.

Dolphin—The Atlantic and Pacific seas.

Dragon's-Blood (a kind of resin)—Japan, Cochinchina, Java, and other parts of the East.

Dromedary—The deserts of Arabia and other parts of Asia, and of Africa.

Ebony—The East Indies (chiefly Ceylon), and West Indies.

Eider Down (from the Eider Duck)—The north of Europe (chiefly Iceland), Asia, America.

Elephant—Africa and the East Indies. The most esteemed are those of Ceylon.

Elk or Moose Deer—North America, some parts of Europe and Asia, as far south as Japan.

Emerald—Egypt and Ethiopia, Russia, the confines of Persia, Mexico, Peru.

Emery (mineral used in polishing steel)—The Levant, Naxos, and other Grecian Islands, Germany, Guernsey, Spain, Italy, United States.

Ermine (a species of ferret)—Norway, Lapland, Finland, North America, Siberia, China.

Fan Palm—The south of Europe, the East Indies (Malabar and Ceylon), Japan, Cochinchina.

Figs—Italy, the Levant, Turkey, the Grecian Islands, Portugal, Spain, and south of France.

Fire-fly—America, India, Japan.

Fitchet (a species of weasel)—India, New South Wales.

Flamingo—Africa, South America, West Indies.

Flax—Every quarter of the globe.

Flying-fish—Inhabits the European, Red, and American seas, but is found chiefly between the tropics.

Flying squirrel—North America.

Frankincense (a kind of gum)—Arabia.

French Plums—Chiefly from Bordeaux.

Frontignac wine—Languedoc, France.

Faller's Earth—Sweden, Saxony, Portugal, Eng-

land; the finest and most plentiful found at Warden, near Woburn.

Galls (a vegetable excrescence)—Asia Minor, and Syria, the best from Aleppo.

Gamboge (a resinous gum)—Tonquin, the East Indies.

Garnet—Bohemia, and other parts of Europe, Madagascar, Ethiopia, India, Syria.

Gazelle—India, Persia, Egypt, Ethiopia.

Gentian (a kind of bitter root)—The Alps, and other mountainous parts of the continent of Europe.

Gin—Originally Schiedam, a village near Rotterdam in Holland, and hence sometimes called Holland Gin. Common gin, a deleterious mixture, made in great quantities in England and the United States.

Ginger (an aromatic root)—The East Indies, West Indies, Abyssinia, coasts of Guinea.

Gold—Asia (Arabia), India, Java, Sumatra, Peru, China, Japan, Siberia, Africa, Mexico, Brazil, Chile, United States.

Golden Eagle—Europe, Siberia, Abyssinia.

Golden Pheasant—China.

Gourd—America, south of Europe.

Grapes—France, Portugal, America, in great perfection; not so in England and other less genial climates.

Guava (a fruit)—The West Indies.

Gualacum (the resin of the *Lignum Vitæ* tree)—South America and West Indies.

Guinea Fowl—Africa.

Gum Arabic—Egypt, Barbary, Turkey, Persian Gulf.

Gypsum (or Plaster of Paris)—America, Spain, Italy, England.

Heliotrope (or blood-stone)—Siberia, Persia, Bukharia.

Hemp—Russia and other parts of Europe (the best from Riga), America, the East Indies, and some parts of England.

Hickory Nut—North America.

Hippopotamus—All the lakes and a number of rivers of Africa.

Hock Wine—Hockstedt in Suabia.

Humming Bird—South America (Guiana), West Indies, and United States.

Hyena (a species of wild dog)—India, Persia, Africa.

Ichnæumon (a species of weasel)—Egypt, Barbary, the south of Asia, and the Indian Islands.

Incense (a resinous perfume)—America.

India Rubber (the inspissated resinous juice of a tree)—Guiana, and other parts of South America.

Indigo (a deep blue vegetable dye)—East Indies, Africa, America, West Indies.

Ipecacuanha (a kind of root used chiefly as an emetic)—South America (Brazil), and the West Indies.

Iron—Sweden, Norway, Russia, England, Scotland, North America, Africa.

Isinglass (fish glue)—Russia.

Ivory—Asia (Achem and Ceylon), Africa (Guinea and the Cape of Good Hope).

Jackal (a species of wild dog)—Africa and the warm parts of Asia.

Jalap (a purgative root)—Chiefly from Xalapa in Mexico.

Jasper—Egypt, Siberia, Spain, Sicily, Hungary, Bohemia, Saxony, Silesia, Mexico.

Jet—Great Britain, Germany, France, and Spain.

Juniper Berries (from which Holland gin is distilled)—Sweden, Holland, Germany, the south of Europe, Asia, America.

Kangaroo—Australasia.

Lac (a vegetable substance prepared by an insect)—The East Indies, Bengal.

Llama (a species of camel)—Peru and Chile.

Lantern Fly—Surinam, and other parts of South America.

Lapis Lazuli (a kind of siliceous earth)—Siberia, China, Tartary, America, and various parts of Europe.

Lemons—Portugal, Spain, France, Italy, the Levant, Arabia, Jamaica, Mexico, and Florida.

Leopard—Senegal, Guinea, and other parts of Africa.

Lignum Vitæ—West Indies, chiefly Jamaica.

Limes—America, West Indies.

Edon—Africa, India, Persia, Japan.
Lodestone—Denmark, Sweden, Norway, Lapland.
Locust—Inhabits Tartary, and migrates in great swarms into various parts of Europe, Africa, and America.
Logwood—Honduras and the West Indies.
Lory (a beautiful species of parrot)—The Molucca Islands, Java, and New Guinea.
Lotus (a species of water lily)—The hot parts of Africa, East Indies, America.
Lynx (a species of cat)—The north of Europe, Asia, and America.
Macaroni—Italy, Sicily, Germany.
Mace—Banda Isle and other East Indies.
Madder (a root used in dyeing)—The south of Europe, Holland, and England.
Madeira Wine—The Island of Madeira.
Mahogany—Jamaica (the best), Cuba, Hayti, the Bahama Islands, Honduras, Panama, South America.
Maize or Indian Corn—America.
Malmsey Wine—Malvesia, one of the Grecian Islands.
Manganese (a species of calcareous earth)—Sweden, Germany, France, England.
Mangrove—Asia, Africa, and South America, between the tropics.
Manna (a vegetable product)—The south of Europe, particularly Sicily and Calabria.
Maple Sugar—Europe and North America.
Marble—Spain, France, Italy, Sweden, Norway, the Island of Paros, England, Scotland, America. The Statuary Marble is from Paros and Carrara.
Melons—Asia, South of Europe, Egypt, Arabia, America, West Indies.
Mica (a kind of argillaceous earth)—Siberia, Bengal, Malabar, Russia, Finland, Sweden, Saxony.
Millet Seed—The south of Europe, Africa, East Indies, and America.
Mocho Stone—East Indies, Iceland, the palatinate of the Rhine and other parts of Europe.
Monkeys—South America and the hottest regions of Asia and Africa.
Molasses—West Indies, United States (Louisiana).
Morocco Leather—The Levant, Barbary, Spain, France, Flanders, England, and America.
Mosquito (a species of gnat)—The hot parts of Europe, Asia, Africa, and America.
Mother of Pearl (the lining of the pearl mussel's shell)—The Red Sea, East Indies, America.
Mulberry—Italy (black), China, (white), United States (white and red), East Indies, Japan, Siberia, Russia.
Muscadel Wine—Languedoc in France.
Musk (an animal odoriferous substance)—Siberia, Persia, Tibet, Tonquin, Cochinchina.
Musk Ox—North America.
Myrrh (a gum resin)—The coast of the Red Sea.
Naphtha (a highly inflammable fluid bitumen)—Baku, on the shore of the Caspian Sea, Persia, Media, Tartary, China, Italy, Peru.
Natron (soda)—Denmark, Hungary, Switzerland, Egypt, China, Bengal, Persia, Syria, South America.
Nautilus Argonauta—The Mediterranean, African, and Indian Seas.
Nitre (a neutral salt, the chief ingredient in gunpowder)—Spain, France, Naples, Egypt, East Indies, America.
Nutmegs—The East Indies, South America.
Olives—Portugal, Spain, France, Italy, Northern Africa, Mexico.
Onyx—East Indies, Siberia, Bohemia, Saxony, Portugal, Mexico.
Opium (a concreted juice, obtained from a species of poppy)—Arabia, Persia, and other warm regions of Asia, especially the East Indies.
Opossum—America.
Orange-outang—Africa.
Oranges—Spain, Majorca, Portugal, Italy, Genoa, Nice, the Azores, America, West Indies. Oranges for wine from Seville in Spain.
Orpiment (yellow arsenic)—Hungary, Georgia, Turkey, the Levant, England.
Orrie Root—Italy and other parts of the south of Europe.
Ostrich—The torrid regions of Asia and Africa, South America.
Ottar, or Attar, of Roses—Arabia, Persia, Turkey, East Indies.

Ounce—The torrid parts of Africa and Asia.

Palm Oil Tree—South America.
Panther—Africa and the hot parts of Asia.
Papyrus (a plant which formed the paper of the early times)—Egypt, Abyssinia, Ethiopia, Syria, Sicily, Madagascar.
Parrots—Africa, East Indies, South America, West Indies.
Pearl (a gem produced by a species of oyster or mussel)—Arabia, Persia, the East Indies, America.
Pearl Ashes—America.
Pelican—South America, all the warm latitudes of the old and new continents, the lakes of Judea and Egypt, and the rivers Nile and Strymon.
Penguin—The South Islands, Europe, America.
Pepper—The East Indies, America, West Indies, Cape of Good Hope.
Peruvian Bark—South America (Peru and Quito).
Petroleum—The East Indies, Persia, Media, Siberia, France, England, Germany, Spain, Italy, and the United States.
Pimento—The West Indies, particularly Jamaica.
Pineapple—Mexico, South America, the hot parts of Africa, India, the West Indies.
Pitch—United States, Sweden, Norway.
Plantain (a fruit)—Africa, South America, West Indies.
Platina—South America (near Quito, Santa Fé, and Choco).
Plumbago—England, and several countries on the continent of Europe, America.
Pomegranate—Spain, Italy, Africa, West Indies.
Porcupine—Spain, Italy, India, Persia, South Tartary, Africa, America.
Porphyry—Egypt, Italy, Germany, and other parts of the continent.
Potash—Russia and America.
Prunes—France (chiefly from the neighborhood of Marseilles).
Ptarmigan (white grouse)—The mountainous parts of Europe and Siberia.
Pomace Stone—The neighborhood of Vesuvius and other volcanoes.
Pumpkin—Germany and America.
Quagga (a quadruped of the horse species)—South America.
Quassia (the root, bark, and wood, of a tree)—South America, and the West Indies.
Quicksilver—Ionia, Hungary, Spain, Italy, East Indies, South America.
Raccoon (a species of badger)—North America, Jamaica.
Raisins—Spain and Turkey, Asia Minor, California.
Rattan Cane—The East India Islands.
Red Port Wine—Oporto in Portugal.
Reindeer—Lapland, British America, Greenland.
Resin (the residuum from the distillation of the oil of turpentine)—Sweden and Norway, United States.
Rhenish Wine—The banks of the Rhine.
Rhinoceros—Africa, East Indies (Bengal, Java, Sumatra, Ceylon).
Rhubarb—Asiatic Turkey, Russia, China, Persia, Tartary, East Indies, and America.
Rice—Asia (the East Indies and China), Egypt, north of Africa, America (the best from Carolina), Spain, Italy, Turkey.
Rock Salt—England, Italy, Poland, America.
Rosewood—Jamaica, the Canary Islands.
Ruby—The East Indies, Peru, Brazil.
Rum—Jamaica, and other West India Islands.
Sable (a species of ferret)—Siberia, Kamchatka, and the northern parts of Europe and America.
Saffron (the flower of a plant)—Egypt, Europe, America.
Sago (a fecula obtained from the pith of a species of palm)—Africa, Malabar, and the East Indian Islands.
Sal Ammoniac—India, Persia, Isle of Bourbon, Egypt, the neighborhood of Etna, Vesuvius, Hecla, and other volcanoes, the Lapiri Islands.
Sandal Wood—The East Indies, and Sandwich Islands.
Sapphire—Brazil, East Indies, Persia, Bohemia, France.
Sardonix—Iceland, the Faroe Islands, Bohemia, Saxony, Ceylon.
Sarsaparilla (root of a plant)—North America.

Sassafras (the root, bark, and wood of a tree)—North America.

Scorpion—Africa, India, Persia, America.

Seal—The north of Europe, Greenland, and the Arctic Sea, the lower parts of South America, in both oceans.

Senna (the leaves of a plant)—Arabia, Persia, and Upper Egypt.

Shaddock (a species of citron)—East Indies, West Indies.

Shagreen (a grained leather prepared from the skin of a species of shark)—Constantinople, Tripoli, Algiers, and some parts of Poland.

Sherry Wine—Xeres in Spain.

Silk—Spain, the south of France, Italy, the Levant, Persia, China, East Indies, and United States.

Silver—Africa, Mexico, Peru, United States, Spain, Germany, Siberia, Sweden, Norway, and England.

Silver Bear—The confines of Russia.

Soy (a liquid condiment prepared from a kind of pulse)—China and Japan.

Spermoceti—The produce of the Cachalot, a whale, inhabiting the European seas, the coasts of America, and Davis Straits.

Sponge (a marine animal production)—The Archipelago, the Mediterranean and Indian Seas.

Spoonbill—South America, Mexico, Jamaica.

Stork—Abyssinia, Arabia, Asia.

Sturgeon—European and American seas and rivers.

Sugar—East India Islands, China, West Indies, Louisiana.

Sulphur—Italy, Sicily, Naples, Spain, Norway, Siberia.

Sunshch (a plant used in dyeing and tanning)—Spain, Portugal, the Levant, and United States.

Swordfish—The Mediterranean, Atlantic and East Indian Seas.

Tamarinde—Arabia, the East Indies, America, West Indies.

Tapir (an animal of the class mammalia)—South America.

Tar—Russia, Sweden, Norway, France, Switzerland, America.

Tarantula Spider—South of Europe, Barbary, East and West Indies.

Tea—China, Japan, India.

Teak Wood—East Indies, (Malabar, Pegu).

Tiger—East Indies, China, Japan, Africa.

Tin—England, the Scilly Islands, Bohemia, Saxony, Silesia, Banca, Molucca, Chile, Mexico.

Timber—Norway, Prussia, Russia, America.

Tobacco—United States, Peru, the West Indies, Asiatic Turkey, China, Philippine Islands.

Tokay Wine—Hungary.

Tolu Balsam (a fragrant concreted juice)—South America.

Topaz—Africa, East Indies, Siberia, Russia, Bohemia, Saxony, Mexico, Brazil.

Tortoise—Africa, Sardinia, America, and West Indies.

Treacle (a gross fluid, obtained in the manufacture of sugar)—The West Indies and Louisiana.

Turpentine (the resinous product of different species of pine, from which an essential oil is distilled)—North America, Russia, Norway, France, Switzerland, the Pyrenees, and Germany.

Turquoise (a mineral of a pale sky blue color)—Persia, Mount Caucasus, Egypt, Arabia, Hungary, France.

Vampire Bat—East Indian Islands, South America, Guinea, Madagascar, New Holland, New Hebrides, Friendly Islands, New Caledonia.

Vanilla (a plant whose aromatic pods are used in the manufacture of chocolate)—South America, West Indies.

Vulture—Egypt, Abyssinia, Arabia, Syria, Persia, South America, West Indies.

Walrus—The coast of Spitzbergen, Nova Zembla, Hudson's Bay, Gulf of St. Lawrence, and the icy Sea.

Whale—Greenland, Davis Straits, the Arctic and Antarctic Seas.

Whisky (a spirit drawn from barley, rye, corn)—United States, Scotland, and Ireland.

White Bear—Tartary.

Wolf—Europe, Asia, Africa, America.

Yams (the edible roots of a creeping plant)—America, West Indies, East Indies, Africa.

Zebra (a species of horse)—The plains of Southern Africa.

Zinc—Germany, United States, and South America.

| 11 " | 22 " | 33 " | 44 " | 55 " | 95 " |

When a policy is terminated at the option of the company, a ratable portion of the premium is refunded for the unexpired term.

Life Insurance.—In ordinary life policies a certain premium is to be paid every year until the death of the insured, when the policy becomes payable to the beneficiary. There are other kind of policies, however, and these are described below:—

Limited Payment Life Policy.—Conditions: Premiums to be paid annually for a certain fixed number of years, or until the death of the insured, should that occur prior to the expiration of this period. Policy payable at death of the insured. Advantages: Payments on this kind of policy may all be made while the insured is best able to make them, and if he live to an old age, the policy will not be a continual burden, but will rather be a source of income, as the yearly dividends may be taken out in cash or added to the amount of insurance.

Term Life Policy.—In this method of insurance, the insurance company agrees to pay to the beneficiaries a certain sum on the death of the insured, should that event occur within a fixed term.

Endowment Policy.—A combination of a Term Policy and a Pure Endowment. These policies are issued for endowment periods of 10, 15, 20, 25, 30, or 35 years, and may be paid up by a single payment, by an annual premium during the endowment period, or by five or ten annual payments. Conditions: 1. Insurance during a stipulated period, payable at the death of the insured, should that event happen within said period. 2. An endowment of the same amount as the policy, payable to the insured, if still living at the end of the period fixed. Advantages: Limited term of payments; insurance during the time when the death of the insured would cause most embarrassment to his family; provision for old age, as the amount of the policy will be paid

to the insured if still living, at a time when advanced age may make it of great benefit.

Annuity Policies are secured by a single cash payment and insure the holder the yearly payment of a certain sum of money during life.

Joint Life Policy.—An agreement to pay a certain sum on the death of any one of two or more persons thus insured.

Non-forfeiting Policies do not become void for non-payment of premiums. In some companies all limited-payment life policies, and all endowment policies, after premiums for three (or two) years have been paid, and the original policy is surrendered within a certain time, provide for paid-up assurance for as many parts of the original amount assured as there shall have been complete annual premiums received in cash by the company. Some companies voluntarily apply all credited dividends to the continuance of the insurance. Others apply the legal reserve to the purchase of term insurance at regular rates.

Special Forms.—The Reserve Endowment, Tontine Investment, and other special policies guarantee to the holder a definite surrender value at the termination of certain periods. The surrender value of a policy is the amount in cash which the company will pay the holder of a policy on its surrender—the legal reserve less a certain per cent. for expenses.

The Reserve of life insurance policies is the present value of the amount to be paid at death, less the present value of all the net premiums to be paid in the future.

The Reserve Fund of a life insurance company is that sum in hand which, invested at a given rate of interest, together with future premiums on existing policies, should be sufficient to meet all obligations as they become due. It is the sum of the separate reserves of the several policies outstanding.

Marine and Transit Insurance.—Insurance of vessels and their cargoes against the perils of navigation is termed *Marine Insurance*.

Inland and Transit Insurance refer to insurance of merchandise while being transported from place to place either by rail or water routes, or both.

Insurance Certificates, showing that certain property has been insured and stating the amount of the insurance and the name of the party abroad who is authorized to make the settlement, are issued by marine companies. They are negotiable and are usually sent to the consignee of the merchandise to make the loss payable at the port of destination.

The adjustment of marine policies in case of loss is on the same principle as the adjustment of fire policies containing the "average clause."

Open Policies are those upon which additional insurance may be entered at different times.

PUBLIC DEBT OF THE UNITED STATES.

STATEMENT TO JANUARY 1, 1903.

Night Signals on Ocean Steamship Lines.

American—Red light, roman candle throwing six red balls.
Anchor—Red and white lights alternately (lanterns).
Allan—Three blue lights displayed in form of triangle.
Cunard—Blue light and two roman candles, each throwing six blue balls.
French—Blue light forward, white light amidships, red light aft simultaneously.
Gulton—Blue lights, forward, aft, and on bridge simultaneously.
Hamburg—Two red, white, blue Coston lights at stern of vessel in succession.
Inman—Blue light forward and aft, and red light on bridge simultaneously.
Monarch—Green, white, green Coston lights.
National—Blue light forward and aft, and red light on bridge forming a triangle.
North German Lloyd—Two blue, red Coston lights, one forward and one aft simultaneously.
Red Star—Red light forward, amidships, and aft, together.
State—Blue, red Coston lights.
White Star—Two green lights simultaneously.

Designating Marks of Ocean Steamship Lines.

LINE. **FUNNEL MARKS.**
American—Lower two thirds red, with white keystone, black top.
Anchor—Black.
Allan—Red, with white ring under black top.
Cunard—Red, with black top.
French—Red, with black top.
Gulton—Lower two thirds black, a red band and black top.
Hamburg—Black.
Inman—Lower two thirds black, white band and black top.
Monarch—French-gray and black top.
National—White, with black top.
North German Lloyd—Black.
Red Star—Cream color, with black top with red star.
Royal Netherlands—Black, with band having green border.
State—Lower two thirds buff, red band under black top.
White Star—Cream, black top.

PRODUCTION OF COAL.**AREA OF THE WORLD'S COAL FIELDS, IN SQUARE MILES.**

China and Japan, 200,000; United States, 194,000; India, 35,000; Russia, 27,000; Great Britain, 9,000; Germany, 3,600; France, 1,800; Belgium, Spain, and other countries, 1,400. Total, 471,800.

The coal fields of China, Japan, Great Britain, Germany, Russia, and India contain apparently 303,000,000,000 tons, which is enough for 450 years at present rate of consumption. If to the above be added the coal fields in the United States, Canada, and other countries,

the supply will be found ample for 1,800 years. Improved machinery has greatly increased the yield per miner, and thus produced a fall in price to the advantage of all industries.

The production of the principal countries in 1899 in metric tons (2,204.6 lbs.) was: United States, 328,717,579; United Kingdom, 223,616,279; Germany, 135,844,419; Austria-Hungary, 38,738,372; France, 32,862,712; Belgium, 22,072,068; Russia (e), 12,800,000; Japan, 6,721,736; Australasia (e), 6,700,000; India, 5,016,055; Canada, 4,142,949; Spain, 2,600,279; Mexico, 409,125; Sweden, 239,344; Italy, 288,534; all other countries (e), 2,500,000; total, partly estimated, 723,617,836. (e) Estimated.

ANNUAL COAL PRODUCTION IN THE UNITED STATES.

| STATES. | Tons. | VALUE AT MINE. | | STATES. | Tons. | VALUE AT MINE. | |

THE SUBMARINE CABLES OF THE WORLD.

[From report issued by the International Bureau of Telegraph Administrations.]

The following table sets forth the entire system of submarine cables of the world, including those along the shores and in the bays, gulfs, and estuaries of rivers, but excepting those in lakes and the interior water-courses of continents. The list includes all cables operated by private companies, and in addition thereto under the name of each nation is given the list of cables operated by the government of that nation.

| COMPANIES. | Number of Cables. | Length of Cables in Nautical Miles. | COMPANIES. | Number of Cables. | Length of Cables in Nautical Miles. |
|--|-------------------|-------------------------------------|---|-------------------|-------------------------------------|
| Anglo-American Telegraph Co.: | | | Central and South American Telegraph Co. | 15 | 7,500 |
| Transatlantic System—Valentia (Ireland) to Heart's Content (Newfoundland)..... | 4 | 7,510 | Oompagnie Allemande des Câbles Télégraphiques..... | 1 | 1,114 |

* Includes Manitoba, Northwest Territories, and British Columbia.

The tables of statistics of hog products were compiled by the Cincinnati *Price Current*.

The Department of Agriculture reported the following farm animals in the United States on January 1, 1900: Horses, 13,537,534, value, \$603,969,442; mules, 2,066,127, value, \$111,717,092; milch cows, 16,292,360, value, \$314,813,106; oxen and other cattle, 27,610,054, value, \$689,486,260; sheep, 41,883,065, value, \$122,065,916. Total value farm animals, \$3,212,706,578.

PRODUCTION OF TOBACCO.**STATEMENT OF PRODUCTION IN THE UNITED STATES FROM THE LAST REPORT OF THE SECRETARY OF AGRICULTURE.**

| New York..... | 5,530 | 6,934,620 | 554,770 | Total..... | 523,103 | 406,678,385 | \$27,760,739 |

Careful estimate by the Department of Agriculture: Area, 595,000 acres; product, 403,004,000 pounds; value, \$24,258,000; yield per acre, 678 pounds. This is the last year that an estimate has been made by the Department.

The number of cigarettes manufactured in the United States in 1890-91 was, according to

the Internal Revenue returns, 2,877,799,440. The value of domestic leaf tobacco exported from the United States, year ending June 30, 1895, was \$25,622,776; value of leaf tobacco imported same period, \$14,745,720.

The product of tobacco in Europe is nearly equal in quantity to the average production of the United States. Neumann-Spallart has

usually made it about 500,000,000 pounds. Austria-Hungary produces about one third of it, Russia one tenth, Germany nearly as much, France about 35,000,000 pounds, and the other countries a small quantity. Europe can easily produce all the tobacco required, but two reasons are prominent for importation of tobacco from this country. It is very cheap, and it is very desirable for mixing with and fortifying European leaf.

TEA AND COFFEE.

Tea.—The limits of actual tea cultivation extend from 39° N. Latitude in Japan to Java, Australia, Natal, and Brazil in the southern hemisphere. China, India, Japan, Ceylon, Paraguay and Java are the great tea-producing countries.

The teas exported are of three principal classes—black tea, green tea, and brick tea, the last being the special form in which it is prepared for use throughout vast tracts of Central Asia.

Coffee.—The regions found to be best adapted for the cultivation of coffee are well-watered mountain slopes at an elevation ranging from 1000 to 4000 feet above sea-level, in latitudes lying between 15° N. and 15° S., although it is successfully cultivated from 25° N. to 30° S. of the equator in situations where the temperature does not fall below 55° Fahr.

Down to 1890 the only source of coffee supply was Arabia. The cultivation is now general throughout all civilized regions of the tropical world. Brazil's annual production probably exceeds that of all other localities combined.

The English are the greatest tea drinkers among western nations, the Americans the greatest coffee drinkers.

CANALS.

Chicago Ship Channel, connecting the waters of Lake Michigan at Chicago with the Mississippi, giving channel 160-290 feet wide, 22 feet depth, was completed in 1900 by engineers of the United States Army.

The Harlem River Ship Canal, connecting the Hudson River and Long Island Sound, by way of Spuyten Duyvil Creek and Harlem River, was opened for traffic on June 17, 1895, and cost about \$2,700,000.

The Erie Canal connects the Hudson River at Albany and Troy with Lake Erie at Buffalo, and is 363 miles in length. It cost \$7,600,000 and was begun in 1817 and completed in 1825 by the State of New York. It is 70 feet wide at the surface and 56 feet wide at the bottom and partly 7 and partly 9 feet deep. It receives its water supply from Lake Erie. It is now planned to greatly enlarge the canal so that boats of 1000-1200 tons may be used.

Manchester Canal.—A ship canal connecting Manchester and Liverpool. It is 35½ miles long, 28 feet deep, and has a bottom width of 126 feet. Its cost was about \$75,000,000.

It makes Manchester a seaport and saves the transshipment by rail, from Liverpool, of imported commodities. The annual traffic is very great.

Baltic Canal.—Also known as the "North Sea and Baltic," "Kiel," and "Kaiser Wilhelm" Canal. This connects the mouth of the Elbe and Kiel Bay. It is 61 miles long, 20½ feet deep, and has a bottom width of 72 feet. Its cost was about \$40,000,000.

It saves two days' time, by steamers, between Hamburg and all the Baltic ports of Germany, as compared with the old route via the strait between Jutland and Sweden. The canal is, of course, a waterway of great strategical importance for the Imperial fleets. It permits the German naval forces to concentrate themselves either in one sea or the other in a very few hours.

Panama Canal.—By convention with the Republic of Panama the United States paid that government for the rights and privileges of constructing the Panama canal \$10,000,000 at the time of the convention's ratification, and, beginning nine years after that date, is to pay \$250,000 yearly as rental. The treaty was ratified Feb. 26, 1904. According to the estimates of the final report of Nov., 1901, submitted to the government by the Isthmian Canal Commission of 1899-1901, the waterway is to be a canal with locks and is to be 49.09 miles long, 35 feet deep, and 150 feet in bottom width. The lock canal would be probably 60 to 90 feet above sea level and the commission estimated the excavation necessary for it at 97,440,489 cubic yards. The chief work of excavation is the Culebra cut, which must pass through the continental divide. The cost of completing was given at \$144,233,358, exclusive of the \$40,000,000 paid to the French Canal Company and the \$10,000,000 to Panama, and the time was estimated at 8 years.

Opinions differ widely as to the kind of canal which should be constructed. Of the board of consultive engineers which was appointed in 1905 to investigate and report upon the possibilities of the ocean canal and which consisted of the best of their profession, five favored a canal with locks and eight a sea-level canal. The former, they estimated could be completed in about ten years, the latter in fifteen at a cost variously computed at from \$240,000,000 to \$300,000,000. The excavation for a sea-level canal would probably be nearly 300,000,000 cubic yards.

Work was begun on the waterway in 1904

under the direction of the Panama Canal Commission appointed on Feb. 29 of that year. This body was found too large for efficiency and in April of 1905 Pres. Roosevelt appointed a new commission consisting of T. P. Shonts, chairman; Charles E. Magoon, governor of canal zone; John F. Wallace, chief engineer; Admiral M. T. Endicott; Gen. P. C. Hains; Col. O. H. Ernst and B. M. Harrod. The first three as an executive committee were to have the chief direction of the enterprise. Engineer Wallace resigned in June and was succeeded by John F. Stevens.

By the canal the distance from New York to San Francisco will be 6,107 statute miles, while by way of Cape Horn it is 15,350 miles. (See also Panama, p. 112.)

Nicaragua Canal was projected to connect the Atlantic and Pacific oceans, using the waters of Lake Nicaragua. Total distance from ocean to ocean, 169.4 miles; depth of canal, 30 feet; least width at bottom, 100 feet; time transit from ocean to ocean, 33 hours; length of Lake Nicaragua, 110 miles; average width, 30 miles; surface area, about 3,000 square miles; area of watershed of lake, about 8,000 square miles.

From New York to San Francisco by water, around Cape Horn, the distance is 15,350 miles; by the Nicaragua Canal the distance between the same points would be 5,655 miles, a saving of nearly 10,000 miles. The distance in statute miles from New York to the Pacific Ocean by the principal land and water routes is as follows: By water to Cape Horn, 7,897; by Southern Pacific Railroad, 3,709; by Canadian Pacific Railroad, 3,619; by Central Pacific Railroad, 3,269; by Northern Pacific Railroad, 3,237; by Nicaragua Canal, 2,519. Estimated cost of construction of Nicaragua Canal by the Nicaragua Canal Commission was \$118,118,790. A later estimate is \$189,000,000.

DICTIONARY OF LAW AND BUSINESS TERMS.

Abandonment. The relinquishing to the underwriters, under an insurance, of all the property saved from a wreck, in order to entitle the insured to claim for a total loss.

Abate. To break down, destroy, or remove; as, for instance, to abate (remove or put an end to) a nuisance.

Abduction. The unlawful taking or detention of a woman (having property in possession or expectancy), against her will, with the intention of procuring her marriage or defilement. Also the unlawful taking of an unmarried girl under the age of sixteen years, out of the possession and against the will of the father, or other person having the lawful care of her, although done without force or corrupt motives. The former is a felony, and the latter a misdemeanor.

Abettor. A person who encourages or excites another to commit an offense punishable by law.

Abseyance. The fee simple of lands is in abseyance when there is no person in being in whom it can vest, so that it is in a state of expectancy or waiting until a

proper person shall appear, or the right thereto is determined. The same applies to dignities or offices.

Abortion. The offense of procuring the miscarriage of a woman quick with child.

Abstract of Title. An epitome of the deeds and documents constituting the evidence of title to an estate.

Above Par. Stock which sell for more than their face value are said to be above par.

Acceptance. The act by which a person on whom a bill of exchange is drawn, undertakes to pay it at maturity. The bill of exchange itself is sometimes called, in common parlance, an acceptance.

Accessory. A person concerned in a felonious offense, although not the actual perpetrator, nor present at its performance. He may be accessory either before or after the fact.

Accommodation Bill. A bill of exchange accepted without value, for the purpose of raising money thereon by discount.

Action. The method of demanding the enforcement of a legal right, and procuring redress for a civil injury in the courts of common law.

Accept. To acknowledge by signature; to accept a draft is to acknowledge the obligation to pay it when due.

Acceptance "supra-protest" or for honor. An acceptance by some third party after protest for non-acceptance by the drawee, with the view of saving the honor of the drawer or of some particular indorser.

Acceptor. The party who accepts a draft so as to bind himself to pay the sum specified in it.

Acknowledgment. To admit; to certify by signature to the genuineness of a deed or mortgage; to give information of the arrival of a letter or remittance.

Accrued. Interest or increase due and unpaid.

Account. A statement; an arrangement of debits and credits in relation to any person or thing; a record of business transactions.

Account Sales. A statement of the product arising from the sale of goods received by a merchant from another party, and sold for his benefit, together with the costs and charges incurred in making such sale.

Accountant. One who is skilled in accounts.

Actuary. A clerk of certain courts and insurance offices; one skilled in annuities; an acting officer.

Administrator. He that has the goods of a person dying without a will committed to his care, for the purpose of legal distribution. The nearest of kin is entitled to administration.

Ad Valorem. Stamp duties, the amount of which is regulated according to the value of the property, etc., are so termed.

Adjust. To put in order; to bring to a satisfactory state, so that parties can agree in the result.

Advance. Additional price, stocks above par.

Advances. Sums of money paid by a merchant upon goods lodged in his hands for sale at a future time. This term also covers money loaned by bankers on bills of lading.

Adventure. Property ventured on a voyage; a speculation.

Advice. Counsel given, usually in regard to the purchase and sale of goods.

Adulteration. Mixing a spurious with a genuine article.

Affidavit. A written statement upon oath. It must be sworn before a person authorized to administer oaths; who that is, depends upon what the affidavit relates to. The same officer is not usually empowered to administer oaths in all the courts.

Affinity. Relation by marriage between the husband or wife and the blood relations of either; but not between the husband and wife themselves.

Affirmation. A solemn declaration in lieu of an oath.

Agent. A person appointed to do an act for another. The act when performed is, in law, the act of the principal; the maxim being "*qui facit per alium facit per se*."

Alibi. Elsewhere. A defense by which it is proved that the accused was not at the place where the offense was committed at the time of its commission.

Alien. One born in a foreign country out of the allegiance of the head or laws thereof.

Alimony. An allowance made by a husband to his wife when living apart from her.

Allocatur. The certificate by which a taxing master certifies the amount at which he has taxed a bill of costs.

Allonge. A slip of paper attached to a note, draft,

or other negotiable paper, to receive indorsements when the back of the paper will hold no more.

Allowance. Abatement, a deduction made for various reasons.

Amount. The sum total; the aggregate. Gross amount is the total without deduction. Net amount is the total less deduction.

Ambassador. An envoy of the highest rank sent to a foreign government.

Ancestor. The law distinguishes between ancestor and predecessor; the former is applied to individuals, the latter to corporations.

Ancient Demesne. A tenure of lands partaking of the properties both of copyhold and freehold.

Annuity. A periodical payment of money, amounting to a fixed sum in each year, the moneys so paid being either a gift or in consideration of a gross sum received.

Anticipate. To take beforehand, or pay before due.

Antedate. To date beforehand.

Appeal. The removal of a cause from an inferior into a superior court, for the purpose of impeaching the judgment of the inferior court.

Appearance to Action. The first formal step by a defendant in an action of suit. It is a notice that he intends to defend.

Appellant. The person appealing to a superior from the decision of an inferior court.

Appraiser. A person who values personal chattels.

Appropriation. The appropriation of a payment means the applying of it to the discharge of a particular debt, where the creditor to whom it is made has more than one debt due from the same debtor.

Appraisement. The act of setting a value upon goods or other property.

Appurtenance. That which appertains or belongs to something else.

Arbitration. An extrajudicial method of settling matters in difference by referring them to the arbitration or determination of persons appointed by the disputants, and termed arbitrators.

Arraignment. A term of criminal procedure. A prisoner, after having had the indictment read over him, is commanded to state whether or not he is guilty. This proceeding is termed the arraignment.

Arrest. A legal seizure, capture, or taking of a man's person which is effected by corporeal touching, or something equivalent thereto. In civil cases a man can only be arrested under legal process. The officer cannot break open a man's outer door for the purpose of arresting him; nor can arrest on a civil process be effected on a Sunday, except after an escape.

Arrest of Judgment. Where the court stays a judgment, after a verdict on some question of law.

Arson. Felonious house burning.

Articles of Peace. A complaint against a person to compel him to find sureties to keep the peace.

Arbitraging. Operating in the same stock or product in two different markets to make a profit out of the difference in price or "spread" between them, as, for instance, buying wheat in St. Paul, and selling it in Chicago.

Arrear. That which is behind in payment.

Assault and Battery. An attempt or offer, with force and violence, to do a corporal hurt to another is an assault; an injury actually done to the person of another in an angry, revengeful, or insolent manner, be it ever so small, is a battery.

Assets. Property, whether real or personal, in the hands of an executor, etc., for the purpose of satisfying debts.

Assignee. A person to whom any real or personal property is transferred by the act of law, as an executor, an assignee of a bankrupt, etc., or by the act of party, as a purchaser of a lease.

Assignment. A transfer of any kind of property from one person to another.

Assumpsit. A verbal or parol promise expressed or implied, springing out of a simple contract. The law always implies a promise to do that which a party is legally bound to perform. An action of assumpsit or promise is the remedy for breach of a parol as distinguished from a written contract.

Assurance. The securing the payment of a sum of money or other benefit on the happening of a certain event, as, for instance, the death of a person. This is the term now usually applied to life contingencies, as contradistinguished from fires, losses at sea, etc., as to which the term insurance is still used.

Assessment. A call upon the holders of stock or

policies to pay into the treasury a certain sum in order to pay off debts or effect a reorganization.

Assign. To transfer or make over to another, the right one has in any object, as in an estate, especially in trust for the security of creditors.

Assay. To determine the amount of a particular metal in an ore or metallic compound.

Assess. To tax, or value for the purpose of taxing.

Assignor. One who makes a transfer to another.

Association. A company of persons united for a particular purpose.

Assume. To take on one's self or become liable for the debts of another.

Attachment. A process of the courts of law and equity for compelling, by arrest, the performance of an act, which a party is already in contempt for not performing. Also an ancient remedy open to creditors in London, and some other cities, to attach the money or goods of their debtor in the hands of a third party within the city.

Attorney. A person appointed by another by letter or power of attorney to do anything for him in his absence.

Attorney-at-Law. An officer of the superior courts of law, legally authorized to transact the business of other persons—termed his clients—in those courts.

Attach. To take by legal authority.

Attest. To call to witness or give official testimony required in solemn instruments.

Auditor. A person authorized to examine and adjust accounts.

Average. A contribution to a general loss. When, for the safety of a ship in distress, any destruction of property is incurred, all persons having goods on board contribute ratably to the loss; this is called average.

Award. The judgment or decision of an arbitrator.

Backing a Warrant. The indorsing by a justice of the peace of the county where a warrant (which has been granted by the justice of the peace of another county) is about to be executed, and is a necessary act to be done before a person can be apprehended in a county different to that in which the warrant was issued.

Bail. The sureties for the reappearance of a person released from custody.

Bail-bond. A document under seal, by which a person becomes bail.

Bailee. An individual intrusted with the custody of goods; for instance, a carrier.

Bailiff. There are various kinds of bailiffs; the most common being those appointed by the sheriff, commonly called sheriff's officer.

Bailment. A delivery of a thing in trust for some special object or purpose.

Bailor. The person who makes a bailment, or delivers goods to a bailee.

Banker. A person who holds the money of another, and disposes of it as the other from time to time directs.

Bank Note. A promise by a banker to pay a specified sum to the holder.

Barristers. A body of men qualified by admission in one of the Inns of Court, to plead as advocates; such admission is termed, being "called to the bar."

Battel. A trial by combat, formerly allowed by the law, by which the innocence or guilt of a party was decided.

Balance. The arithmetical difference between the two sides of an account; the sum necessary to make the two sides of an account equal in amount, spoken of as a debit or credit balance; (verb) to bring into a state of equality; to settle by paying what remains due on an account.

Balance of Trade. The difference in value between our exports and our imports.

Bank. An establishment for the custody and issue of money; the office in which the transactions of a banking association are conducted.

Bankable. Receivable as cash by a bank, such as checks, express orders, money orders, etc.

Bank Bill. The note of a bank payable on demand, and used as currency; a bank note.

Bank Book. The book kept by a depositor, in which the receiving teller writes the separate deposits, and the bookkeeper of the bank enters the paid checks.

Bank Clearing. The aggregate amount of the checks and drafts exchanged between banks (members of clearing house association). In large cities less than ten per cent. of the commercial business is done with currency. While the clearings do not represent the sum total of the counter transactions of banks for any given

time, they form a good basis for calculation as to the comparative volume of trade from week to week. They really indicate the growth or shrinkage of trade.

Bequest. A testamentary disposition of personal estate.

Bear. A stock exchange phrase used to designate a man who, having sold more stock than he possesses, endeavors to depress its value, that he may buy at a low rate, and so make good his deficiency.

Bigamy. The criminal offense of a married man or woman pretending to marry again, his wife or her husband (as the case may be) being still alive.

Bill. The term applied to an intended statute when passing through Congress, prior to its becoming law.

Bill of Exceptions. A mode of appealing from the decision of a judge on a point of law.

Bill of Exchange. A written order for payment of money by one person (called the drawer), upon another (termed the drawee). When the drawee has undertaken to pay the bill, which he does by writing his name across it, he is termed the acceptor. Bills of exchange are negotiable, i. e., they confer on the holder the right of suing upon it, which he could not do in the case of a mere ordinary contract, for the want of that privacy which the law in ordinary cases requires between the parties to a contract. The law as to bills of exchange is governed by the Law Merchant. (See Law Merchant.)

Bill of Lading. A memorandum or receipt signed by the master of a ship, acknowledging the shipment of goods, which are usually made deliverable to the consignee by post. By indorsing the bill of lading the property in the goods is passed to the indorsee, and so from hand to hand. The bill of lading, properly indorsed, forms, in fact, the title to the goods, and without the production of which the captain would not deliver the goods.

Bill of Sale. An assignment of goods and chattels, by writing; generally, but not necessarily, under hand and seal.

Bill of Lading. A negotiable receipt for goods delivered to a transportation company for carriage.

Bill of Parcels. A written statement given by the seller to the buyer, containing particulars of the goods bought and their prices.

Bills Discounted. Promissory notes, acceptances, or bills of exchange discounted for the accommodation of an indorser by bankers.

Bills Payable. Promissory notes or drafts held by a merchant against others for future payment.

Bills Receivable. Promissory notes or drafts due to a merchant by others.

Bill of Rights. A bill permitting an importer to examine his goods at the custom house.

Block. A number of shares, say 5,000 or 10,000, massed together and sold or bought in a lump.

Bona Fide. With good faith.

Bond. A written obligation, under seal. If for the payment of a sum of money upon or after the death of a person, it is then termed a post-obit bond. The person making a bond is called the obligor, and he to whom it is given, the obligee.

Borough. A town having now, or having formerly had, corporate rights.

Bottomry. The borrowing of money by the master on the bottom or hull of a ship; to be paid with interest, if the ship return in safety, but otherwise to be lost or forfeited.

Board of Trade. A voluntary association of business men for the regulation and advancement of commercial interests.

Bond. An instrument under seal, by which the maker binds himself, and usually his heirs, executors, and administrators, to do or not to do a specified act. A certificate of ownership of a specified portion of a capital debt due by a government, a city, a railroad, or other corporation, to individual holders, and usually bearing a fixed rate of interest.

Bonded Goods. Imported goods left in a bonded warehouse until the duties are paid.

Bonded Warehouse. A government warehouse in which bonded goods are stored until the duties thereon are paid.

Bonus. A premium on a loan; something extra or in addition.

Boom. A rush of business. A quick inflation of values.

Breach of Covenant. The doing of an act which a party has covenanted not to do, or neglecting to do that which he has covenanted to perform.

Breach of the Peace. An act by which the public

repose is disturbed, and the safety of the community more or less endangered.

Breach of Promise. The doing, or abstaining from doing, something, contrary to an understanding or contract.

Breach of Trust. A neglect of duty by a trustee, or person standing in a fiduciary relation, in violation of his trust.

Bribery. The giving or receiving any reward for corrupt purposes.

Brief. An abridgment of a client's case, for the instruction of counsel on trial or hearing in court.

Broker. An agent employed to buy or sell goods; a sort of middleman between vendor and purchaser. He is not, like a factor, intrusted with the possession of the articles he vends.

Brokerage. The commission paid to a broker.

Brand. A trade-mark; a particular kind of goods.

Break. A quick, small decline.

Burglary. The offense of entering a dwelling-house, in the night, with the intent to commit felony.

Bursar. The treasurer of a college. In Scotland it is nearly synonymous with sizar in the English universities.

Bucket Shop. A place where bets are made on quotations of prices, established on legitimate Exchanges, and Boards of Trade. Pretended trading. Illegal in most States.

Buige. A quick, small advance.

Build. A person whose interest is to secure higher prices; a buyer for an advance.

Bulling. Raising the price of stocks, etc.

| s. Shillings. | = Equal to. |

Buyer Three. A Wall street expression signifying that the buyer has three days in which to pay for his purchase.

Bullion. Uncoinced gold or silver, including gold dust, ingots, and bars.

By-Law. A private law made by those duly authorized by charter, custom, or prescription; but such by-law must be consonant to the public laws and statutes, and for the common benefit.

By-Bidder. One who bids at an auction in behalf of the owner for the purpose of running up the price of articles.

Canon Law. A collection of ecclesiastical constitutions, definitions, and rules, derived from the ancient councils, the writings of the fathers, ordinances of popes, etc. At the Reformation it was enacted that a review should be had of the Canon Law; but that, until such review, the existing law should continue in force, except as far as the same should be repugnant to the law of the land or the Royal Prerogatives—which still remains the state of the law, such review never having been made. The canons of 1603 having been made by the clergy, and confirmed by the king, James I., alone, but not by Parliament, do not bind the laity.

Capias. A writ authorizing the arrest of a defendant in a suit. It is issued, either after judgment, or when it is satisfactorily shown that the defendant is about to leave the realm before trial.

Capias ad Satisfaciendum, or CA-SA. The writ of capias when issued after judgment; so termed, because the defendant is taken to satisfy the plaintiff's demands.

Carrier. A person whose business it is to carry goods for the proper delivery and safety of which he is legally responsible.

Caveat. A proceeding to prevent an act being done, such as the granting of administration, without notice to the party entering the caveat.

Caveat Emptor. Let the purchaser beware. It signifies that a vendor is not bound to answer for the goodness of his ware, unless he expressly warrants them.

Call. A privilege to buy at a certain time for an agreed price, called the "call price," which is always a little above market price.

Call Loans. Money loaned subject to the call or demand of lender. It must be returned the day it is called for before the close of banking hours.

Capital. Money or other property invested in business.

Cashier. The clerk who has charge of the cash; the second executive officer in a bank.

Carat. Weight showing the degree of fineness of gold.

Cargo. A ship's lading or freight.

Carte Blanche. Signature of an individual or individuals on blank paper with space above to write a note; full power.

Certiorari. A writ for the removal of a cause from an inferior to a superior court. This writ always lies, unless where expressly taken away by statute, and here-in it differs from an appeal, which can never be had unless expressly given.

Certificate. A written voucher attesting a fact.

Certified Check. A check to which the cashier of a bank certifies in writing as to the genuineness of the signature of the drawer, and that he has funds on deposit sufficient to meet it, the bank reserving the amount certified and regarding it as having been already paid, and therefore unavailable for other use.

Challenge. An exception taken by a prisoner against one or more jurors, who, when challenged, are set aside, if the challenge be allowed, and new ones put in their places.

Chancellor. An officer of the highest dignity and authority in various departments.

Chancery. The highest court of judicature next to the Parliament, and of very ancient institution. The Court of Chancery is called a Court of Equity, because it was instituted for the purpose of proceeding by the rules of equity and conscience, and of moderating the rigor of the common law; equity being the correction of that wherein the law, by reason of its universality, is deficient. Yet the Court of Chancery is not intended to act in opposition to, but in assistance of, the common law, supplying its deficiencies, not contradicting its rules; no judgment of law being reversible by a decree in Chancery.

Charter. A royal grant or privilege, granted to corporations, companies, etc.

Charter-Party. An instrument between merchants and owners or masters of ships, containing the particulars of the contract for the hire of the ship. It is in fact a mercantile lease of the ship.

Chattels. There are two kinds, chattels real and chattels personal; the former are leasehold property, and the latter personal goods or chattels, as furniture or money.

Chose. A thing. Chose-en-action is a thing of which a man has not the possession, and which he can only claim by action, as, for instance, a debt owing to him by another.

Chattel Mortgage. A mortgage of personal property.

Check. An order upon a bank, or banker, to pay on demand to the person named in the check, or to his order, the sum of money specified in the body of the check in writing.

Choses in Possession. Things of which one has the possession.

Citation. The first step in an ecclesiastical cause, analogous to the writ of summons in an action.

Civil Law. The Roman law is comprised in the institutes, code, and digest of the Emperor Justinian.

Cipher Code. An arrangement of words to stand for phrases, numbers, or quotations, so that telegrams may be thus sent in a private and condensed form.

Client. Anciently, a Roman citizen, taken under the protection of some great man, who was styled his patron. The term is now applied to a party who employs a solicitor or counsel in any legal proceeding.

Clear. To exchange checks and bills, and to settle balances as is done in a clearing house.

Clearing House. An organization for the settlement of balances between members. Usually applied to banks.

Clearing House Certificates. Certificates issued by a clearing house against collateral approved by the loan committee, and used in the settlement of the daily balances between its members.

Clearance. Certificate from the custom authorities permitting a vessel to leave port.

Clearing. Act of leaving port.

Clique. A combination of persons "to run a deal" or manipulate a market. Usually applied to stocks, grain, and provisions.

Closed Policy. A policy in which the amount insured is definitely stated.

Codicil. A supplement to a will.

Commission. The warrant, or letters patent, authorizing any inquiry judicial or otherwise; as the commission of the judges, the commission of the peace, etc.

Commitment. The sending a person who has been guilty of any crime, to prison, by warrant or order.

Committee. Persons to whom the consideration of any matter is referred; as a Committee of the House of Congress.

Common (Rights of). These are of four sorts: viz., pasture, piscary, estovers, and turbary. Common of pasture is the right of feeding one's cattle on the land of another; piscary, that of fishing in waters belonging to another; estovers, the right of taking wood from another's estate, for household use and implements in handiwork; and turbary, the right of digging turf upon another's ground.

Common Law. The law of England is composed of Acts of Parliament or statutes, and the custom of the realm, the latter consisting of those rules or maxims which have obtained by common consent an immemorial usage. The former are designated the *lex scripta*, or statute law; the latter the *lex non scripta*, or common law. This term is also applied to the superior courts of Westminster, which are called Courts of Common Law, as distinguished from the Court of Chancery, which is the Court of Equity.

Complainant. One who complains of the act of another in a court of justice, more commonly called plaintiff.

Compounding Offenses. Entering into an agreement not to prosecute an offender, for any consideration received or to be received, constitutes a crime, for which the offender may be indicted.

Compounding with Creditors. An agreement by which creditors take a portion of their claims in discharge of the whole.

Conditions of Sale. The terms upon which a vendor undertakes to sell to a purchaser.

Confirmation. A deed by which a voidable estate in land is made perfect.

Conjugal Rights. Those rights of husband and wife which spring out of their relationship.

Consanguinity. Relationship by blood, in contradistinction to affinity, which is a relationship by marriage.

Conservator. A standing arbitrator, appointed to compose and adjust differences that may rise between parties, etc.

Consideration. The price or motive of a contract, without which a simple contract is void. In technical language, it may be defined as "some detriment to the plaintiff sustained for the sake or at the instance of the defendant, or some benefit to the defendant moving from the plaintiff."

Consignee. A person to whom goods are delivered either as purchaser, or more generally for sale on commission.

Consignor. The person by whose act or direction goods are delivered to the consignee.

Consignment. The act of making over, or delivering, goods to another.

Conspiracy. A combination of two or more persons to carry into effect an unlawful purpose.

Consul. An officer appointed by government to reside abroad and watch over the interests of our countrymen who may happen to reside in or be passing through the place where the consul is located.

Contempt. A disobedience to the rules, orders, or process of a court, which has power to punish such offense, which it does by imprisonment.

Contract. A covenant or agreement between two or more persons with a lawful consideration.

Contribution. Where one surety or joint contractor has been obliged to satisfy the whole demand, he may obtain contribution from his fellow surety or contractor.

Contributory. One liable to contribute to the liquidation of the liabilities of a joint stock company, under the Winding-up Acts.

Conveyance. A deed which passes or conveys land from one person to another.

Conveyancers. Persons who devote themselves to the preparation of formal documents concerning property.

Convict. He that is found guilty of an offense by the verdict of a jury.

Coroner. An officer whose duty it is to inquire into the cause by which any person came to a sudden or violent death, which must be done, before him and the jury assembled for the purpose, upon view of the body.

Costs. The expenses incurred in the prosecution or defense of legal proceedings, of which there are two kinds, those between party and party, and those between attorney and client.

Count. In common law pleadings, is a section of a declaration.

County Court. Local courts established throughout the country.

Covenant. An agreement under seal.

Coverture. The state of a married woman as being under the protection and influence of her husband or baron. She is called a *feme covert*.

Coalers. Coal roads. A term usually applied on stock exchanges to describe the Reading, Lackawanna, Delaware and Hudson, and Jersey Central Railroads.

Cocket. A custom house warrant to show that goods have been entered.

Collaterals. Stocks, bonds, notes, or other value, given in pledge as security when money is borrowed.

Collateral Security. Security for the payment of money or the performance of covenants in addition to a principal promise or bond, e. g., a warehouse receipt for a paid-up insurance policy given as security for the payment of a promissory note would be collateral.

Combine. A word expressing the same meaning as "trust" and supposed not to be quite so distasteful to the opponents of monopolies.

Commercial Paper. Negotiable paper, such as drafts, bills of exchange, etc., given in the due course of business.

Common Stock. The ordinary shares in a corporation.

Compromise. An agreement embracing mutual concessions.

Concern. The business itself considered as a person independent of its ownership.

Consign. To send goods or property to an agent or broker. The sender of the goods is a consignor; the receiver is a consignee, and the goods or things sent are a consignment.

Consols. A contraction of "consolidated." It represents the consolidation of Great Britain's bonded debt, and is the leading English funded government security.

Contango. (London Stock Exchange.) A rate paid for carrying shares over until next settlement day. When a broker desires to "continue shares" or to postpone the day of payment or delivery, the premium paid is called in the seller's case "backwardation" and, in the buyer's case, "contango."

Conversion. Bonds are frequently issued with a provision whereby they can at any moment be exchanged for equivalent stock. Such securities are called "convertible," and the act of substitution is called "conversion."

Corner. An artificial scarcity created by holding property off the market for the extortion of abnormally high prices. Where the purchases of any party or parties exceed the amount of contract grain in regular warehouses on the last delivery day of the month for which such purchases have been made, the grain so bought is said to be cornered.

Corporation. A corporate body authorized by law to act as a single individual.

Coupon Bonds. Bonds payable to bearer without any registration of the owner's name anywhere. The interest in these bonds is evidenced by coupons which, when they become due, are cut off the original bond and collected.

Cover. The buying in of grain or stocks to fill short contracts is called "covering."

Covering Shorts. Buying in property to fill contracts (usually for future delivery) previously made.

Coasting. A sailing near land, or trade carried on between ports in the same country.

C. O. D. Collect on delivery. Goods sent by express marked in this way must be accompanied by the bill for them. This bill is collected and receipted by the messenger of the express company, before delivering the goods.

Commerce. Interchange of values or commodities.

Common Carrier. One who makes it a business to transport goods; railroad companies are common carriers.

Compact. An agreement by which the parties are firmly bound together.

Company. An association of persons for a common enterprise.

Contraband. Prohibited; illegal.

Condition Precedent. A condition which must be carried out before the obligation is performed.

Copartnership. Joint concern in business.

Correspondence. An interchange of letters, or intercourse.

Counterfeit. A forgery; spurious bank bills.

Countersign. To sign, as secretary or subordinate officer, a writing which has been signed by the superior.

Coupon. An interest certificate attached to a bond; when paid, it is cut off.

Cross-Examination. The interrogation of a witness by or on behalf of the party against whom the evidence is given.

Credentials. Testimonials; that which gives credit or authority.

Custom. A law, not written, established by long use, and the consent of our ancestors; if it be universal, it is common law; if particular, it is then properly custom.

Customs. Duties levied on commodities exported and imported.

Curb. Prices made by private transactions not in trading hours are called curb markets.

Curbstone Market. A hanger-on of Board of Trade or Stock Exchanges, who does business on the sidewalk. An irregular speculator, with the street for his place of business, and for his office his hat.

Currency. Money in current use.

Custom House. A government place where imported goods are entered and duties collected.

Damages. The amount of money awarded by a jury, to be paid by a defendant to a plaintiff, as a compensation for the injury of which the latter complains.

Days of Grace. Usually three days allowed for the payment of a note after maturity.

Debenture Bonds. Concentration of floating capitalization into convenient bonded form. Originally, notes in the form of bonds.

Debenture. A written instrument of the nature of a bond or bill for a certain sum of money.

De Bonis Non. When an administrator dies, the right does not descend to his own representative, but a fresh grant of administration must be obtained of the goods remaining unadministered, and which is called an administration de bonis non.

Declaration. In an action at law, signifies the plaintiff's statement of his cause of action.

Declaration of Trust. A written or verbal expression or statement, by which a person acknowledges himself to be a trustee for another. If relating to lands, it must be in writing.

Deed. A writing sealed and delivered by the parties to it.

De Facto. A thing actually done or existing.

Default (judgment by). If a defendant omits to appear or plead to an action, within the time allowed, the plaintiff can sign judgment by default.

Defaulter. A person who neglects to perform an act required to be done.

Defeasance. A collateral deed made at the same time with some other deed, and containing certain conditions which may defeat or render null and void the provisions of such other deed.

Defendant. The party against whom an action or suit is brought.

Demerene. Lands which formerly the lord kept in his own hands, being next to his mansion.

Demise. A word used in conveyances of estates for terms of years.

Demurrage. A compensation or allowance for detaining a ship beyond the usual or specified time.

Demurrer. A mode of raising a point of law, upon the facts stated in the pleadings, assuming them to be true.

Deposition. The testimony of a witness taken down in writing and signed by him.

Devise. The giving away of lands or other real estate by will.

Debtor. A party who owes a debt; one who owes another money, goods, or services.

Delivery Day. The first trading day of the month is usually called delivery day, but, as all transactions are at the option of the seller, he may select and deliver the grain on any day of the month for which it has been sold.

Deposit. To place funds in a bank; a sum deposited at a certain time; the amount on deposit at any given time.

Defalcation. A deduction, abatement, or diminution, as in a promissory note.

Debt. What one owes to another.

Delivery. To pass money or goods to another; a giving.

Demand. An asking by authority; a claim by right.

Depository. One to whom something is intrusted; a guardian.

Deputy. One appointed to act for another; a representative.

Disability. A legal incapacity to do an act.

Disclaimer. A renunciation by an executor or trustee of the office imposed upon him, also a mode of defense in equity, etc.

Discovert. A term applied to a widow or unmarried woman.

Disfranchise. To take away from certain places or persons any privilege, freedom, or liberty.

Disseisin. A wrongful invasion of the possession of another, and turning him out from the occupation of his lands, either by force or surprise.

Distress. The distraining or taking the effects of a tenant, in order to satisfy the rent due to his landlord.

Dishonor. To refuse to accept a draft, or to pay a note of acceptance.

Direct Evidence. Evidence which applies directly to the fact to be proved.

Discount. In mercantile transactions, a discount means a deduction of a certain amount from the face of a bill for cash. In banking, a discount means the deduction of a certain amount from the face value of a note or bill, as a payment for allowing the holder of the note the immediate use of the money; the rate of discount varies.

Dividend. A portion allotted to stockholders in dividing the profits.

Domicile. The domicile of a person is where he has his permanent home. There are three sorts of domiciles — by birth, by choice, and by operation of law.

Dower. A widow is entitled, at the death of her husband, to a life interest in a third part of the estates of inheritance of which her husband was seised, and did not dispose of by deed or will.

Domiciliated. A negotiable instrument payable in a different place from that in which it is drawn is domiciliated where payable.

Donee. One to whom a gift is made or a bequest is given.

Donor. One who gives or bestows.

Dormant. Not acting; a partner who takes no share in the active business of the concern, but shares in the gains or losses.

Drop. In stocks or grain it is equivalent to a "break" except that it may be due to wholly natural causes.

Draft. A bill of exchange used for domestic purposes.

Drawback. Duty refunded on exported goods.

Drawee. One on whom a draft is drawn; the payor.

Drawer. One who draws a bill or draft.

Duress. Anything done under compulsion and through unavoidable necessity.

Dun. To press urgently the payment of a debt.

Duty. A government tax paid on goods imported or exported.

Duplicate. A copy or transcript of anything.

Easement. A convenience which one has in or over the lands of another, as a way or a water course.

Earnest. A pledge, like money deposited, affords good grounds for reliance.

Effects. Goods or property of any kind.

Ejectment. An action at law to recover the possession of lands.

Elegit. A writ of execution under which all the debtor's lands may be seized or extended, and held by the judgment creditor until his judgment is satisfied.

Embezzlement. The act of appropriating that which is received in trust for another, which is a criminal offense.

Embargo. Prohibition of vessels from sailing.

Embarrassment. Financial distress; on the verge of bankruptcy.

Embassy. A public message or commission; the person by whom it is sent.

Emporium. A commercial center.

Enfeoff (To). The act of conveying an estate of freehold by deed of feoffment.

Enfranchisement. The admittance of a person into a society or body politic. Enfranchisement of copyholds is a conversion of copyholds into freehold tenure.

Engrossing. A style of writing, not now generally used, for deeds, but still used for the probates of wills.

Enrollment. The registering of deeds as required by certain statutes; as, for instance, deeds conveying lands to charitable uses.

Entail. That inheritance whereof a man is seized to him and the heirs of his body. Tail-general is where lands and tenements are given to one, and the heirs of his body generally. Tenant in Tail-special is where the gift is restrained to certain heirs of the donee's body, as male or female.

Entry. A record of a business transaction; depositing of a ship's papers at custom house to procure license to land goods.

Endorse. To write one's name on the back of a check, note, or draft.

Equitable Mortgage. The most familiar instance is the deposit (either with or without a memorandum, although it is better to have one) of the title deeds of an estate by way of security, which constitutes an equitable mortgage without the execution of any formal mortgage deed.

Equity of Redemption. The right which equity gives to a mortgager of redeeming his estate after the appointed time for payment has passed, and which right can only be barred by a foreclosure.

Equity. In law, qualifying or correcting the law in extreme cases.

Error. A writ of error is a commission to judges of a superior court, by which they are authorized to examine the record upon which a judgment was given in an inferior court, and to affirm, reverse, or vary the same, according to law.

Errors Excepted. A phrase inserted as a proviso, that the person who renders a statement may have the power of correcting any mistake that he may have committed.

Escheat. Is where lands, for want of heirs, or from forfeiture, escheat or fall back to the sovereign or lord of the fee as the original grantor.

Estate. The interest which a person has in lands, or other property.

Estoppel. Where a man is precluded in law from alleging or denying a fact in consequence of his own previous act, allegation, or denial to the contrary.

Estreat. Where a recognizance becomes forfeited by any of its conditions being broken, it is estreated; that is, extracted from the record, and sent up to the Exchequer, whence a process will issue to recover the penalty.

Evidence. Proof, either written or unwritten, of the facts in issue in any legal proceeding.

Excise. A tax or impost charge by government on certain commodities.

Execution. The act of putting the sentence of the law into force.

Executor. One appointed by a person's last will to administer his personal estate.

Exhibits. Documents, etc., produced in evidence, and marked for the purpose of identification.

Ex Officio. Anything done by virtue of an office. An information filed by the attorney-general, by virtue of his office, is called an Ex Officio-Information.

Ex Parte. A statement is called ex parte where only one of the parties gives an account of a transaction, in which two or more are concerned.

Ex Post Facto. An ex post facto law is a law made purposely to restrain or punish an offense already committed.

Extrajudicial. Any act done by a judge beyond his authority, or any opinion expressed by him not strictly pertinent to the matter in issue before him.

Exhaust Price. The point at which one's margins will be exhausted. If trades are not re-margined they are likely to be closed out by the broker at the exhaust price, if it is reached by the market.

Exchange. Act of bartering; a bill drawn for money; a place where merchants meet; a difference between the value of money in two places, or the premium and discount arising from the purchase and sale of funds.

Executory. Yet to be performed.

Exports. Goods or produce carried abroad in commerce.

Express. A special messenger; a regular conveyance for packages, etc.

Factor. An agent intrusted with the possession of goods for sale belonging to his principal. A broker, on the other hand, has not the custody of the goods of his principal.

Faculty. A privilege or dispensation granted by an ecclesiastical court in certain cases.

False Pretenses. The criminal offense of obtaining any chattel, money, or valuable security by means of a false pretense; it is punishable by transportation, fine, or imprisonment.

Face. The amount expressed on a note or draft.

Failure. Act of becoming insolvent.

Facsimile. An exact copy.

Fancy Stocks. Term applied to stocks subject to sudden fluctuation in price.

Favor. A note or draft is said to be in favor of the payee.

Fee Simple. That estate or interest in lands which a person holds to him and his heirs forever. During his life he possesses over it a perfectly free and unrestrained power of disposition, and on his death, without having alienated it by deed or will, it descends to his heirs, both lineal and collateral, male and female, according to an established order of descent.

Felony. Formerly defined as comprising "all capital crimes below treason." It may now more accurately be defined as comprising all crimes occasioning a forfeiture of lands or goods or both.

Feme Covert. A married woman.

Feme Sole. An unmarried woman.

Fcoffment. A mode of conveyance of lands in fee, accompanied by certain solemnities. It is rarely, if ever, now used.

Fiat. An order or warrant for a thing to be done or executed.

Fieri Facias. A writ of execution, by which the sheriff is commanded to levy the debt and damages of the goods and chattels of the defendant.

Finding. A finder of goods may appropriate them to his own use if he really believes when he takes them that the owner cannot be found; but if a jury should say that the finder appropriated the goods, not having (or that he could reasonably be supposed not to have had) such belief at the time of appropriation, it amounts to a theft, and can be punished criminally.

Finding a Bill. The grand jury either find or ignore the bills against prisoners; if they find a true bill, the case goes into court, and is tried.

Fire Policy. An instrument by which an insurance company guarantees to a person, who has insured his property, the payment of a sum of money, if it is injured or destroyed by fire.

Fixtures. This term is generally used to denote those personal chattels which, though annexed to the freehold of demised premises, a tenant is nevertheless entitled to remove. They consist of trade fixtures, and of those put up for the ornament or convenience of the premises.

Finance. Revenue; income; pertaining to money.

Financier. An officer of finance; one having charge of the revenue.

Firm. A partnership, trading house, or its name.

Fiscal. Pertaining to a treasury or revenue.

Fiat. A term signifying that stocks are sold without reference to accumulated interest; low in price; dull as to sales.

Flotsam. Goods which float after being thrown overboard at sea or in case of shipwreck. The goods thus cast away are called jetsam or jettison, if they sink and remain under water.

Foreclosure. The barring the equity of redemption on mortgages.

Foreign Bill of Exchange. A bill drawn by a person abroad, and accepted in the United States, or vice versa.

Forfeiting Recognizances. When a person who has entered into recognizances fails to comply with their conditions, the same are forfeited or estreated.

Forfeiture. A punishment consequent upon the commission of certain criminal offenses or illegal acts.

Forgery. The crime of counterfeiting a signature, seal, or mark; or the fraudulent alteration of a writing to the prejudice of another.

Foreclose. To cut off the power of redemption under a mortgage.

Foretell. To buy goods before they reach the market.

Folio. Page of a book, usually the two opposite pages.

F. O. B. Free on board; the bill or invoice with

F. O. B. includes the transporting to the shipping port and all the shipping expenses.

Foreign Exchange. Drafts drawn on the financial centers of Europe; for instance, London, Berlin, or Paris. Drafts on London are called Sterling Exchange, as they are drawn in pounds sterling.

Franchise. A royal privilege to which a subject is entitled—as a fair, a market, a free warren, a park.

Fraud. A dishonest and illegal artifice, by which undue advantage is taken of another, or by which the interests of that other are unjustly prejudiced. Fraud strikes at the root of every transaction, and vitiates every contract, whether by record, deed, or otherwise.

Freehold. Land held in fee simple, fee tail, or at least for life.

Freight. The remuneration due to the owner of a ship for the conveyance of goods or merchandise, on which he has a lien for the freight.

Franc. A French silver coin, value about twenty cents.

Frank. A free letter.

Free Trade. The policy of conducting international commerce without duties.

Fractional Orders. Orders for less than 5,000 bushels of grain or 100 shares of stock are called fractional orders, as the above amounts represent the units of speculation. Fractional orders are entirely regular, both on the Chicago Board of Trade and the Stock Exchanges. Orders are executed in 1,000 bushel lots of wheat, but not in corn or oats. Neither is there any market for small quantities of provisions or cotton.

Frozen Out. Said of deals or trades closed out compulsorily because of inability to further protect contracts with re-margins.

Funded Debt. The public debt of this country, consisting of an immense sum which, from time to time, has been lent to government by individuals, and which they or their assigns receive interest for, out of the taxes.

Future Estates. Estates not in possession, but in expectancy, as a remainder.

Funds. Stock or capital, a sum of money.

Funded. Put into a permanent loan on which an annual interest is paid.

Futures. Buyers of cash grain protect themselves against possible loss by selling an agreed amount for future delivery in some general market, usually Chicago. Such contracts are called futures because they do not terminate until some designated month in the future. These transactions pass from hand to hand and may be turned over hundreds and thousands of times in an active market before maturity, and this is called dealing in futures. Nearly all speculative operations are in futures.

Garnishee. The party in whose hands money, due to a defendant, is attached.

Gain. Profit; benefit; increase in wealth.

Gauging. Measuring the contents of casks, etc.

Gist. The main point of a case; the turning point.

Gift. A voluntary conveyance or gift of lands or goods. If of the former, it is liable to be defeated in the lifetime of the grantor, by his conveying the same lands to a purchaser, for a valuable consideration, even though with notice of the prior gift.

Gold and Silver Certificates. Certificates issued by the United States government, circulating as money, on the security of gold deposited with the government for that purpose, or of silver coin belonging to itself.

Gross Weight. Weight of goods including case, bag, etc.

Grace, Days of. The name given to the days of indulgence allowed to the acceptor of a bill of exchange after it becomes due. The number of such days varies in different countries. In some, as in France, they are abolished altogether. In England, three days are allowed, so that a bill at a month drawn on the first of one month, will become due on the fourth of the next.

Grand Jury. The jury to whom all bills of indictment are referred in the first instance. It is the duty of this jury to interrogate the witnesses for the prosecution, and ascertain whether or not a prima facie case is made out against the prisoner; if so, they find a true bill, and he takes his trial; if not, they ignore the bill, and he is discharged.

Grant. A mode of conveyance, formerly applicable only to incorporeal hereditaments, reversions, etc.; but its significance has been extended by a recent statute, and it is now the instrument most usually employed in the conveyance of land.

Granger Roads. Western railroads. This term was originally applied in Wall street to the Chicago and Northwestern, and the Chicago, Milwaukee, and St. Paul roads, but is now employed on Stock Exchanges to designate those railroads which handle principally farm produce.

Gross. Whole; entire; total; specifically without deduction, as for damage or waste material; without allowance of tare, opposed to net, as gross sum or amount, gross profits, income or weight.

Guaranty. An engagement to be responsible for the debts or duties of a third person.

Guarantor. A warrantor.

Guaranteed Stock. Stocks of leased or subsidiary company guaranteed by the principal company.

Habeas Corpus. A writ of right for those who are grieved by illegal imprisonment. The Habeas Corpus Act is next in importance to Magna Charta, for, so long as this statute remains, no subject of England can long be detained in prison, except under legal process.

Habendum. One of the formal parts of a deed; its office is to limit or define the estate granted. It is so called because it begins with the words "to have."

Harbor. A place of rest or safety for ships; a port for loading and unloading.

Heir. The legal representative of his ancestor, with respect to the real property of such ancestor. He takes all the real property not otherwise disposed of by the ancestor in his lifetime or by his will.

Heir Apparent. Is one whose right of inheritance is certain, and which nothing can defeat, provided he outlives his ancestor; as the eldest son or issue. Heir presumptive is one who would inherit, provided his ancestor were to die at that particular time, but whose right of inheritance might be defeated by some nearer heir being afterwards born; as a brother or nephew, whose presumptive succession may be destroyed by the birth of a child.

Heirlooms. Such personal chattels as go to the heir along with the inheritance, and not to the executor of the deceased.

Hereditaments. All things which may be inherited, that is, which would descend to the heir, if not disposed of by deed or will. Hereditaments are of two kinds, corporeal and incorporeal.

Hedge. The operation called hedging by speculators is practically the same as straddling, though the terms are not synonymous. Traders hedge to avert a loss and straddle for a profit.

High Seas. Waters of the ocean outside of the jurisdiction of any country.

Homicide. The crime of killing any human being; of which there are three kinds—justifiable, excusable, and felonious.

Honor. To accept and pay when due.

Hue and Cry. The old common law process of pursuing felons "with horn and voice." Also, the name of a paper now circulated amongst the police containing the names and description of felons.

Hypothecate. A term used for pawning a ship and goods, or either, for necessities, which a master of a ship may do when in distress at sea.

Ignore. When the grand jury reject a bill of indictment, they are said to ignore it, from the Latin word *ignoramus*.

Illegal Condition. A condition annexed to anything which is illegal, immoral, impossible, or otherwise contrary to law.

Immoral Contracts. Contracts infringing the rules of morality which, for reasons of public policy, are void at law.

Impaneling. Writing in a parchment schedule the names of the jury by the sheriff.

Import. To bring from another country.

Importer. One who brings goods from abroad.

Impost. Duty on goods paid by the importer.

Incorporeal Hereditaments. Hereditaments of a non-tangible nature, and consisting of rights or benefits issuing out of corporeal or tangible things,—as a rent, an advowson, etc.

Incumbent. The present possessor of an ecclesiastical benefice.

Incumbrance. A charge or lien upon property, as a mortgage.

Indemnity. A written instrument whereby one undertakes to free another from responsibility.

Indenture. A deed or writing, formerly cut or in-

dented; now the name usually given to deeds, although indenting is no longer essential.

Indictment. A written accusation of one or more persons, of a crime or misdemeanor, preferred to, and presented on oath, by a grand jury.

Indorsement. Anything written on the back of a deed or other instrument; such as a bill of exchange.

Infant. Every person is by the law styled an infant till he has attained the age of twenty-one years.

Inheritance. An estate in lands or tenements to a man and his heirs.

Injunction. A prohibitory writ granted by the Court of Chancery forbidding certain acts to be done under pain of contempt. It may be granted in urgent cases *ex parte*, but notice is sometimes required to be given.

Inquest. A meeting of jurors, who are summoned to take into consideration certain matters, which may appear in evidence before them, and to bring in their verdict accordingly.

Inquiry (writ of). A writ directed to the sheriff, commanding him to summon a jury and assess the damages in an action; as, for instance, when the defendant has suffered judgment by default.

Insolvency. The state of a person who is unable to pay his debts.

Insurance. A security or indemnification against the risk of loss from the happening of certain events. The usual kinds are fire and marine.

Interpleader. When two or more persons claim the same thing of a third, the latter may call upon them to interplead, i. e., to try the right to it between themselves; he, the third person, retaining possession of the thing in the meantime, as a kind of stakeholder.

Interrogatories. Written questions to which the parties interrogated are to give written answers on oath.

Intestate. A person dying without a will, or, having made a will, without appointing an executor thereof.

Innuendo. That part of the declaration, in actions of libel and slander, which explains the meaning, or points the application, of the libelous or slanderous matter complained of.

In Re. In the matter of.

Installment. Part of a sum of money paid or to be paid from time to time.

Interest. The use of money; premium paid for the use of money.

Investment. The laying out of money in the purchase of property.

Inventory. A list of goods.

Invoice. A list of goods bought or sold, or consigned.

In Sight. Said of stocks of grain, cotton, coffee, or other merchandise, available for immediate use. Grain stored in private warehouses, or held by producers, is not usually included in the supply "in sight."

Inspection. Grain received at Chicago is inspected and graded by sworn inspectors under rules established by the Board of Railroad and Warehouse Commissioners, appointed by the state of Illinois. From this inspection, if not satisfactory, an appeal may be taken to the Inspection Committee of the Board of Trade. In other states similar laws exist.

I. O. U. A written acknowledgment of a debt. This instrument is regarded in a court of law as evidence of an account stated. It is not a promissory note and does not require a stamp.

Issue. The disputed point or question to which the parties in an action have, by pleading, narrowed their several allegations, and are hence said to join issue. If it be an issue of fact, it is tried by a jury, if of law, by the court. Issue is also the legal term for children or remoter descendants.

Jettison. A voluntary throwing of goods overboard at sea in a storm to lighten the ship.

Joinder in Action. The coupling or joining two parties in one suit or action.

Joint Tenants. Persons who hold lands, etc., jointly by one title. On the death of one the survivor takes the whole.

Jointure. A settlement of lands or tenements on a woman, to take effect after her husband's death in lieu of dower.

Journal. A book used to classify and arrange business transactions.

Judgment. The sentence of the law pronounced by the court upon the matter contained in the record.

Jury. A certain number of men sworn to deliver a verdict upon such evidence of facts as shall be delivered to them, touching the matter in question.

Judgment Note. A note in the usual form, with the addition of the power to confess judgment if not paid.

Jurisdiction. The authority by which judicial officers take cognizance of and decide causes.

Landlord. A proprietor of lands occupied by another, which latter party is termed the tenant.

Lease. A forfeiture of the right of presentation to a church by the neglect of the patron to present. The word is also applied where a testamentary gift falls by the death of its object in the lifetime of the testator.

Larceny. The wrongful and unlawful taking and carrying away by one person of the personal goods of another, with the felonious intention of converting them to his own use.

Law. This word signifies generally an inflexible rule of action. The law of England is composed of written laws or statutes, and unwritten laws, or the customs of the realm. The latter is also termed the common law.

Law of Nations. A system of rules or principles deduced from the law of nature, and intended for the regulation of the mutual intercourse of nations.

Leading Question. A question put or framed in such a form as to suggest the answer sought to be obtained. Such a question is not allowed to be put to a witness, except on cross-examination.

Lease. A conveyance or demise of lands of tenements for life, or years, or at will, but always for a less term than the party conveying has in the premises.

Lease and Release. The form of conveyance, until recently commonly used for conveying land; but a lease, commonly called a lease for a year, is no longer necessary; the release alone being now as effectual as a lease and release were formerly.

Leasehold. Lands held on lease, which (however long the term) are considered as chattels real, and go to the next of kin, and not to the heir, on the death of the owner intestate.

Legacy. A gift or bequest of money, goods, or other personal property by will. The person to whom it is given is styled the legatee; and, if the gift is of the residue, after payment of debts and legacies, he is then styled the residuary legatee.

Lessor and Lessee. The person who grants a lease is called the lessor, the party to whom it is granted, the lessee, and the person to whom either of them assigns, the assignee.

Letters of Administration. The instrument granted by the Probate Court under which administrators derive their title to administer the goods and chattels of an estate.

Letters (or Power) of Attorney. A writing, under seal, empowering another person to do any act instead of the person granting the letter. It may be either general or special; the attorney represents his principal in the matters prescribed by the letter until it be revoked.

Letters of License. An instrument whereby creditors grant to their debtor time for the payment of his debts, and bind themselves not to molest him until that time has expired.

Levy. The seizing of goods or chattels by a sheriff under an execution is called a levy.

Ledger. Book of accounts.

Letters of Credit. A letter authorizing the holder to receive money on account of the writer.

Legal Debts. Debts that are recoverable in a court of common law.

Legal Tender. That which the law authorizes to be tendered in payment of debts. Strictly speaking, it is the exact amount of the debt in current funds. It is not a legal tender to demand change.

Letter of Advice. A letter of information concerning a shipment of goods or of the drawing of a draft.

Libel. A malicious defamation, expressed either in printing or writing, or by signs, pictures, etc., tending either to blacken the memory of one who is dead, or the reputation of one who is alive, and thereby exposing him to public hatred, contempt, or ridicule.

Lien. A qualified right which a person has in or to a thing in his possession, arising from a claim upon the owner. Liens are of two kinds, particular or general.

Limited Liability. The limitation of the liability of shareholders in a company to the amount unpaid upon their shares, introduced by recent Acts, and applicable to all companies registered thereunder; such companies are bound to use the word "Limited" in their title after the word "Company."

Lineal Descent. That which goes from father to son, from son to grandson, and so on.

Liquidated Damages. Damages, the amount of which is fixed or ascertained.

Liability. Debt or claim against a person.

License. Legal permission to sell goods or to do certain things.

Liquidate. To pay off, as debts; to settle or adjust accounts.

Lighterage. A charge for conveying goods to or from a vessel in a harbor.

Limit. A set figure, at which one's trade is to be made or closed.

Liquidation. When employed by speculators, this term signifies the selling out of property previously bought or contracted for. The expression "liquidation by longs," is in contradistinction to "covering by shorts." In a market where both processes are extensively carried on, it is called "evening up."

Loan. To deliver to another for temporary use; the thing lent.

Long. One who has property bought in anticipation of a rise in price. Hence, for a trader to be "long" of stocks or grain presupposes him to be a "bull." Also used adjectively.

Long Market. A market that is overbought, the volume of open contracts to buy property for future delivery being in dangerous excess of the probable demand.

Lunatic. One who has had understanding, but, by grief, disease, or other accident, has lost the use of his reason generally, though he may have lucid intervals.

Magna Charta. The great charter of English liberties granted by, or rather extorted from, King John, at Runnymede, between Windsor and Staines, on the 15th of June, 1215, and afterwards confirmed by Henry III.

Malhem or Mayhem. The violently depriving another of the use of such of his members as may render him less able, in fighting, either to defend himself or to annoy his adversary.

Malice Prepens. Malice aforethought; i. e., deliberate, predetermined malice.

Mandamus. A writ commanding the completion or restitution of some right, or the performance of a duty.

Manor. A territorial domain, held partly by the lord and partly by his tenants; it must have continued from time immemorial, and have annexed to it a Court Baron, with at least two suitors.

Manlaughter. The unlawful killing of another, but without malice.

Manumission. The making a bondman free.

Marque and Reprisal (Letters of). Commissions granted to individuals to fit out privateers in time of war; not used in the late war, and abandoned by all the great powers at the Congress of Paris, 1856.

Master of the Rolls. An assistant of the Lord Chancellor, who hears and decides the cases assigned to him, at his own court in the Rolls Yard. He holds his office by patent for life.

Maturity. Bills, or notes, when due, are said to be at their maturity.

Maxims in Law. Certain proverbial axioms, which form part of the general custom or common law of the land. As, "No man is bound to criminate himself." "Conditions against law are void." "It is fraud to conceal fraud," etc., etc.

Malfeasance. An act which one has no right to do.

Mandatory. One to whom business is intrusted or charge given.

Manifest. A list of articles comprising a vessel's cargo.

Manufacture. The process of converting raw material into articles of use and sale.

Margin. A sum of money deposited with a broker, in stock transactions, to protect him against loss by the depreciation of stocks held by him for another party. Also the difference between the value of securities deposited as collateral and the amount loaned upon them.

Marine. Relating to the sea.

Maritime Law. Law relating to harbors, ships, and seamen.

Mart. A place of public sale; a market.

Maximum. The highest figure.

Merger. The sinking of a smaller estate into a greater, whereby the former is utterly extinguished and destroyed. It takes place when two estates meet together, without any intermediate estate between them, to both of which estates the same individual is entitled in one and the same right—as where a tenant for life afterwards acquires the fee simple.

Mesne-Process. Commonly used to describe the first process in an action, as where a party used to be arrested on mesne-process, as distinguished from an arrest on a final judgment.

Mercantile Law. Law relating to business transactions.

Mercantile Agency. A concern which procures information relating to the financial standing and credit of merchants for the use of others, to whom said merchant may apply for credit.

Misdemeanor. An indictable offense, which, though criminal, does not amount to felony.

Misprision. A neglect, oversight, or contempt; as, for example, misprision of treason is a negligence in not revealing treason.

Minimum. The lowest figure.

Mint. The place where money is coined.

Misfeasance. Doing in an improper manner, by which another receives an injury.

Mitigation. Lessening the amount of a judgment, penalty, or punishment.

Moot Point. An obscure point of law not definitely settled; and therefore open for discussion.

Mortgage. A conveyance of lands by way of security, for the repayment of a sum of money borrowed, or owing.

Mortmain. Lands held by corporations are said to be held in mortmain.

Motion. An occasional application to the court, to obtain some rule or order in the progress of a cause.

Money. Current coin and circulating medium.

Money Broker. A broker who deals in money or exchanges.

Monopoly. The sole power of vending goods.

Mortgagee. The person to whom the conveyance is made.

Mortgagor. One who makes the mortgage.

Municipal Law. That which pertains solely to the citizens of a particular state, city, or province.

Muniments. Deeds, evidences, and writings in general.

Murder. Unlawfully killing any person, with malice aforethought, either express or implied by law.

Mutiny Act. An Act annually passed to punish mutiny and desertion, and for the better regulation of the army.

Naturalization. The making a foreigner a lawful subject of the state.

Negotiable Instruments. Those instruments which confer on the holders the legal right to sue for the money or property thereby secured, and which by delivery pass such money or property from man to man—as bills of exchange, bills of lading.

Next Friend. The party in whose name an infant or feme-covert brings an action or suit.

Negotiable. That may be transferred by indorsement and delivery, or by delivery alone.

Negotiate. To transact business or treat with another respecting trade or treaty.

Net. Clear of all charges and deductions.

Net Proceeds. The sum left after deducting commission or discount, etc.

Negotiable Paper. Notes, drafts, or other written obligations, which may be bought and sold.

Net Cash. A term applied to a bill of goods to be paid without any allowance or discount, and without reference to time, but by common custom understood to be thirty days, unless otherwise specified.

Nisi Prius. A term applied to those courts in which civil causes are tried before a judge and jury.

Nolle Prosequi. An acknowledgment by the plaintiff that he will not further prosecute his suit, as to the whole or a part of the cause of action.

Non Assumpsit. He has not promised. A plea by which a defendant denies his liability in an action of assumpsit.

Non Pros. When the plaintiff neglects to take any step within the prescribed time, the defendant may move for a judgment against him, which is called judgment of non pros.

Non suit. A renunciation of a suit by a plaintiff, after which he may still commence another action for the same cause, which he could not do if a verdict goes against him.

Notary Public. A person whose business it is to note and protest bills of exchange, and who also attests deeds and writings, to make them authentic in another country.

Non Feasance. The non-performance of an act that should be done.

Note. An obligation without a seal; a written promise to pay.

Nominal. Existing in name only.

Nuisance. Anything which unlawfully annoys or does damage to another. Nuisances may be either public or private.

Nuncupative Will. An oral will before a sufficient number of witnesses, and afterwards reduced to writing—now abolished, except as to soldiers and sailors.

Nunc Pro Tunc. Literally, now for then; and is often so used in legal proceedings.

Oath. An appeal to God as a witness of the truth of what is affirmed or denied in evidence, in the presence of a judge, magistrate, or other officer authorized to administer oaths.

Obligation. That which legally binds a party to perform a duty.

Official Assignees. Officers of the Court of Bankruptcy, one of whom is allotted to each bankrupt's estate. He acts with the assignees appointed by the creditors in the administration of the estate; but his especial duty is to keep the assets of the estate, and receive and pay all money on account of it.

Onus Probandi. The burden of proof. It is a legal principle that the issue in an action must be proved by the party who states an affirmative; not by the party who states a negative. The burden of proof, therefore, is on the former party.

On Call. When money is loaned "on call," it is understood that it must be returned the day it is called for, before the close of banking hours, and without previous notice.

Open Policy. A policy upon which amounts yet to be ascertained and insured, may be entered at different times.

Option. Property bought or sold at the call or demand of the buyer or seller as may be specified; a conditional contract.

Ostensible Partner. A person whose name appears to the world as a partner in a firm. Although such a person may not have any interest in the partnership, he is liable for its debts and engagements.

Outlawry. The act or process by which a person is excluded from, or deprived of, the benefit of the laws, attended with a forfeiture of his goods to the Crown.

Outlawed. Term applied to a debt or note which has run beyond the time when its payment can be enforced by law.

Overt Act. An open act, capable of being manifested by legal proof.

Overdraw. To issue a check for more than the concern's deposit.

Overdue. Remaining unpaid after maturity.

Overissue. An issuing as of stock, beyond or in excess of the capital stock.

Oversold. The reverse of overbought.

Owe. To be indebted to, or bound to pay.

Oyer and Terminer. A commission directed to the judges and others, by virtue whereof they have power to hear and determine treasons, felonies, etc.

O Yes. A corruption of the French *oyez*, hear ye! The term is used by a public crier to enjoin silence and attention.

Panel. A schedule or slip of parchment, containing the names of such jurors as have been returned by the sheriff to serve on trials.

Paraphernalia. Things to which a wife is entitled over and above her dower, consisting of wearing apparel and ornaments suitable to her rank and station in life. The husband may (with the exception of his wife's wearing apparel) dispose of them in his lifetime, but not by will. On his death they belong to the wife absolutely.

Parol. Word of mouth, verbal.

Particeps Criminis. A participator in the crime.

Partition. The dividing of lands held by joint tenant, coparceners, or tenants in common, into two distinct portions.

Pawn. A delivery of goods and chattels, to be retained until a debt is discharged.

Par. Equal value; when market value equals face value.

Partnership. Company; union of two or more in business.

Pawnbroker. One who lends money on a pledge or deposit of goods.

Pa. ca. The party to whom payment is to be made.

Payor. One who pays or is bound to pay.

Paper Profits. Profits on contracts not yet closed, and consequently not yet in hand.

Par of Exchange. Equivalent value of the currency of a country in that of another.

Partial Payment. Part payment of a debt.

Partner. An associate in business.

Passing a Dividend. When the directors of a corporation vote against declaring a dividend it is said to be "passed." This is nearly always the cause of great weakness in the stock.

Penance. An ecclesiastical punishment, varied according to the nature of the offense, in which the penitent is supposed to make satisfaction to the Church for the scandal he has given by his evil example.

Perjury. The offense committed by a person who, having been sworn to tell the truth in a matter pending in a court of justice, willfully and deliberately takes a false oath.

Perpetuity. A rule that land cannot be limited beyond a life or lives in being and twenty-one years afterwards, and the period of gestation, if it actually exists, is commonly called the rule against perpetuities.

Personal Estate, or Personality. Movable things, whether alive or dead, as distinguished from land, or immovables, which are termed real estate.

Petitioning Creditor. A creditor who petitions the Court of Bankruptcy to make his debtor a bankrupt.

Pin Money. An allowance set apart by the husband for the personal expenses of a wife, *i. e.*, for her dress and pocket money.

Pit Traders. Brokers who are in the pit daily trading for their own account.

Plaintiff. The complainant in an action or suit.

Plea. The defendant's answer to the plaintiff's declaration.

Pleader. A lawyer, who draws the pleadings in actions.

Pleadings. The mutual allegations or statements which are made by the plaintiff and defendant in an action.

Pledge. A pawn; a deposit as security.

Posse Comitatus. The power of the county. This includes the aid and attendance of all men, except ecclesiastics and inferior persons, above the age of fifteen, within the county; which force may be used in cases of riot or rebellion, or where any resistance is made to the execution of justice.

Postea. The verdict of the jury drawn up in due form, and entered on the back of the record.

Pound Breach. The indictable offense of breaking open a pound for the purpose of taking cattle therefrom.

Policy of Insurance. Contract between the insurer and the insured.

Portage. The price of carrying; cost paid by the captain for running his vessel.

Point. On stock exchanges "a point" is understood to mean one dollar a share. A decline in Missouri Pacific from twenty-five to twenty-two would be a decline of three points.

Pool. The stock and money contributed by a syndicate to control the price of a given surety or commodity. Also refers to the individuals composing the pool.

Post Date. To date after the real day.

Pre-emption. The right of first buying.

Prescription. A title acquired by use and time, and allowed by law.

Presentment. The notice taken by a grand jury or inquest of any offense, etc., from their own knowledge or observation.

Primogeniture. The right of the eldest son to inherit his ancestor's estate, to the exclusion of the younger son, where the ancestor has died intestate.

Privilege. An exemption from the general rules of law. It is of two kinds—real, attaching to any place, or personal, attaching to persons, as ambassadors, etc.

Probate. The copy of a will made out on parchment with a certificate of its having been proved.

Process. A general term applied to formal judicial proceedings.

Prohibition. A writ issuing out of the superior courts directing the judge of an inferior court not to proceed further in a suit.

Promissory Note. A written promise by which one person engages or promises to pay a certain sum of money to another.

Pro Rata. In proportion.

Protest. On bills of exchange. A protest means

the solemn declaration of a public notary of the dishonor of a bill.

Proviso. A condition inserted in a deed, on the performance whereof the validity of the deed frequently depends.

Premises. Things previously mentioned; houses, lands, etc.

Premium. The sum paid for insurance; the excess of value above par.

Price. Value set or demanded; current value.

Price Current. A table of the current price of merchandise, stocks, bills of exchange, etc.

Prima Facie. On the first view of the matter.

Primage. A charge imposed in addition to the freight.

Principal. An employer; the head of a commercial house; the sum loaned, upon which interest is paid.

Preferred Stock. Shares of a corporation having preference over ordinary shares, but not over bonded or mortgaged indebtedness. Preferred stock is usually issued for borrowed capital. Earnings, if any are left after paying interest on the bonded debt, go next to pay a dividend on the preferred stock, and only what then remains is applied to the common stock.

Privileges. "Puts" and "Calls." A "put" is the privilege or option, which a person purchases, of "putting," *i. e.*, delivering, property or contracts for property to the seller of such privilege, at a named price within a stipulated time—one or more days, weeks, or months. "Puts" are good (from the buyer's standpoint) when the market declines below the "put" price within the time covered by the privilege contract. The buyer can then buy the property at the cheaper figure and "put" it to the person who sold him the risk, his profit being the difference between the "put" price and the quotation at which the property is bought with which to make the delivery. A "call" is the reverse of a "put," the purchaser of a "call" acquiring the right to "call" upon the seller of the privilege for property, or contracts for property, at a named price within a stipulated time. "Calls" are good when the market advances above the call price, and the buyer of such privilege is enabled to sell at a profit the property "called" from the seller of the privilege. The seller of privileges occupies, in a sense, the position of an insurance or guaranty company. He sells market risks as an insurance company sells fire, life, or accident risks. Trading in privileges is illegal in some states, notably in Illinois. Prices paid for privileges are usually \$1.00 per thousand bushels for a single day, \$1.25 for a week or ten days, and from \$2.50 to \$7.50 for a month or during the life of a distant option.

Promoters' Shares. Those issued by corporations in payment of the services of promoters in the organization of companies.

Pyramiding. Enlarging one's operations by the use of profits which one has made. For instance, if one buys 5,000 bushels and the market advances 2 cents, he sells, realizes \$100 profit, and with this in addition to his additional margin he buys 10,000 bushels of wheat, which he closes on a further advance and makes a still larger investment. On steadily advancing markets with moderate reactions this plan makes large profits, but must not be followed too far and liberal margins should be kept.

Quarantine. Signifies 40 days. It is applied to the period which persons coming from infected countries are obliged to wait on board ship before they are allowed to land. But in law it more strictly applies to the similar period during which a widow, entitled to dower, is permitted to remain in her husband's capital mansion after his death, whilst she awaits the assignment of her dower.

Quash. To annul or cancel.

Quasi Contract. An implied contract.

Quid Pro Quo. Giving one thing for another, being the mutual consideration in contracts.

Quo Warranto. An ancient writ still in use, directed against any person or corporation, who usurps any office, franchise, or liberty, calling upon them to show by what authority they support their claim.

Quotations. A statement of the prices of articles of merchandise, given for the information of correspondents.

Rape. The carnal knowledge of a female who is above the age of ten years, against her will; or of a girl under the age of ten years, although with her permission. The age of consent varies.

Rate. The proportion or standard.

Real Estate or Realty. The term applied to land, in contradistinction to personality.

Recital. The formal statement of some matter of fact in any deed or writing. It usually commences with the formal word "Whereas."

Recognizance. An obligation of record which a man enters into, with condition to do some particular act; as, to appear at the assizes, to keep the peace, to pay a debt, or the like.

Record. An authentic testimony, in writing, contained in rolls of parchment, and preserved in a court of record.

Re-Entry, proviso for. A stipulation in a lease that, on non-payment of rent or non-performance of the covenants, the lessor may re-enter.

Registrars. Officers having custody of a Registry, such as the registrars of births, marriages, and deaths.

Rejoinder. The answer of a defendant in an action to the plaintiff's replication.

Release. A form of conveyance. Also, an acquittance under seal of a debt or other obligation.

Remainder. A vested or contingent estate or interest in land, limited to take effect and come into possession on the determination of a prior estate created at the same time.

Rent. The annual return made by the tenant to his landlord, which may be either money, labor, or provisions.

Replevin. An action to try the validity of a distress. The things distrained are re-delivered to the tenant on security or pledges given by him to try the right.

Reprieve. A suspension of the execution of sentence of death on a criminal.

Rescue. A resistance against lawful authority, as, for instance, the violently taking away a man who is under legal arrest.

Residuary Devisee. The person to whom a testator devises the remainder of his lands, not otherwise disposed of.

Residuary Legatee. A legatee to whom is bequeathed the residue or remainder of a testator's personal estate, after payment of all legacies, claims, and demands.

Residue or Residuary Estate. The portion of a testator's estate not specifically disposed of.

Retainer. A fee given to counsel to secure his services. It may be either general or special. The former secures the services of the counsel to the party giving it in all matters; the latter only in one cause or matter. The fee in the former cause is five guineas, in the latter one guinea.

Return of a Writ. The certificate of the sheriff made to the court of what he has done towards the execution of any writ directed to him.

Reversal. The making a judgment void, in consequence of some error in the same.

Reversion. The residue of an estate left in the grantor, and returning to him or his heirs, after the grant is determined.

Receipt. A writing acknowledging the taking of money or goods.

Refund. To repay or pay back.

Resources. Pecuniary means; effects; property.

Respondential Bond. A pledge of a cargo at sea.

Retail. To sell in small quantities.

Revenue. Tax; income; rents; customs and duties.

Revocation. The recall of power or authority conferred, as the revocation of an agency.

Receiver's Certificates. Those issued by a receiver for the purpose of raising money for a company in the jurisdiction of a court. When approved by the court and issued, they are a first lien upon the net earnings and property of the company.

Registered Bonds. That class of Government Bonds which are payable to the order of some individual or corporation, whose name is registered as the owner thereof in the government offices at Washington. Such bonds, if stolen or lost, cannot be realized upon.

Remittance. Value, as bills or money transmitted to another.

Renewal of a Note. Extending the time of its payment by giving a new note in exchange for it.

Rule. An order made by the court at the instance of one of the parties in an action. It may either be a rule absolute, or merely a rule nisi, or to show cause.

Rules of Court. The rules framed by the judges for regulating the practice of the different courts of law.

Salvage. An allowance made for saving ships or goods from enemies, or wreck, or loss at sea.

Seire Facias. A judicial writ founded on matter of record, and used for various purposes, as, for instance, to enforce against a shareholder a judgment against a Joint Stock Company, which it is unable to satisfy.

Servicer. One intrusted with other men's moneys to put out for them, and for which he charges a commission, or bonus.

Scrip. Dividends issued by a stock company payable in stock. Scrip dividends are simply an increase of the capital of the company, as the stock issued to meet them is added to the capital, and in its turn is entitled to future dividends.

Scalper. One who trades in options continually, and, by reading the temper of the market at the moment, tries to get a profit out of the minor fluctuations; also applied to irregular railroad ticket brokers. The term is coming into general use in other lines.

Scalping. Buying and selling on small fluctuations of the market. Taking a small profit or a small loss.

Seizin. Possession of a freehold estate. Seizin in deed is when actual possession is obtained. Seizin in law is a right to lands of which actual possession has not been obtained.

Separate Estate. Real or personal property settled upon a married woman, and which she may dispose of as if she were a single woman.

Sequestration. Used in several cases; but most frequently as signifying an execution for debt against a benefited clergyman, in which case the debt is satisfied out of the tithes and other profits of the benefice. In Scotland a sequestration is nearly equivalent to our term "bankruptcy."

Set-off. A mode of defense, whereby a defendant sets up a demand of his own to counterbalance the plaintiff's claim either wholly or in part.

Seaworthy. Fit for a voyage; in a proper condition to venture a sea.

Secondarily. Applied to the indorser of a note or the drawer of a bill, signifying that he is only conditionally liable, or liable if the maker and drawee fail.

Seigniorage. The difference between the commercial value of bullion in coin and the face value of the coin itself.

Shipment. Goods; act of shipping.

Short Market. A market that is oversold; the volume of open contracts to deliver property being in dangerous excess of available supply.

Short Selling. The process of selling property for future delivery in the expectation of being able to obtain the property cheaper before the maturity of contract, or of being able to close out the contract at a profit without the actual delivery of the property.

Simony. The corrupt presentation of anyone to an ecclesiastical benefice, for money, gift, or reward.

Simple Contract. An agreement entered into verbally or by writing not under seal.

Sight. The time of presenting a bill to the drawee.

Signature. The peculiar style in which a person signs his name.

Sinking Fund. A fund created by a government or corporation for the extinction of its indebtedness, by the gradual purchase of its outstanding obligations, and the application of the interest saved on these obligations thus redeemed to further purchases.

Silent Partner. One who invests his capital in a business house, but whose name does not appear in the firm. His liability is limited to the extent of his contribution, except in cases where he fails to make the proper publication of his connection with the concern.

Silver Certificates. Those issued against standard silver dollars deposited in the treasury, in denominations of \$1, \$2, \$5, and \$10, and higher denominations. Not legal tender but receivable for public dues.

Slander. The malicious defamation of a man by word of mouth, analogous to libel, which is slander by writing.

Solicitor. One who solicits; a lawyer or advocate in a court of chancery.

Solvency. Ability to pay all debts.

Special Pleading. When the pleadings in an action are not in the ordinary form, but are of a more complex character, they are termed special pleadings.

Specific Performance. A remedy in equity, to compel the performance of a contract according to its terms, instead of proceeding at law to recover damages merely.

Specialty. A writing sealed and delivered, containing some agreement.

Speculation. Buying commodities not needed for use, or selling commodities not owned, with the hope of making profits by fluctuations in the values of these commodities. A speculator buys wheat because he hopes to sell it at a better price, but not because he needs it for use. He sells sugar stock because he believes he can buy it at a cheaper price later, and make the difference.

Statutes. The written laws of the kingdom are of two kinds, public or private; the former applies to all statutes which affect the public generally, and of which the judges take cognizance without being specially pleaded. The latter relates to the private rights of individual bodies, as, for instance, the various acts for the management of railway and other companies are private acts.

Stoppage in Transitu. Goods sold on credit to a person, since becoming insolvent or bankrupt, may be seized by the vendor at any time before their actual and complete delivery to the vendee. This seizure is called stoppage in transitu; it is often a nice and difficult question to determine when the transit has ended and the purchaser's possession begun.

Stipend. Settled pay for services; daily, monthly, or annual salary.

Stipulation. An agreement or contract.

Stocks. Shares in joint stock companies, and notes on the government.

Stock Broker or Jobber. One who speculates in stocks.

Statute of Limitations. An assigned period within which legal action must be commenced to enforce payment.

Statement. Usually a list of property, or resources and liabilities.

Statistics. A collection of facts respecting any particular thing.

Sterling Exchange. A bill of exchange drawn on London. This is the most general current exchange, and is good for the payment of debts anywhere. Our shippers of cotton, grain, flour, and merchandise receive bills of lading with draft attached, which they sell to foreign exchange houses here, who issue their bankers' bills against these commercial bills.

Stock. Certificates issued by a corporation certifying that the person in whose name they are written and stand registered on the corporation books is entitled to share in the company's profits, to vote, etc.

Stock, Assessable. That is liable to assessment.

Stock, Cumulative. One on which a corporation agrees to pay past due dividends before declaring a dividend on stocks coming after it in the distribution of net earnings.

Stock Exchange. An incorporated body of brokers, who buy and sell stocks, bonds, and other values.

Stock, Non-Assessable. Stock carrying with it no liabilities.

Subornation of Perjury. The offense of procuring another to take a false oath.

Subpoena. A writ used for the purpose of compelling witnesses to attend and give evidence.

Sufferance. A tenant at, is a person who acquired the possession of lands by right, and holds over after his right is determined.

Suit. Proceedings in equity are usually termed suits, as distinguished from the proceedings at common law, which are termed actions.

Summons, Writ of. The process used for the commencement of all action in the courts of law.

Supersedeas. A command to stay some ordinary proceedings at law, on good cause shown.

Sue. To prosecute in law.

Surety. Security against loss; a person bound for the faithful performance of a contract by another.

Suspend. To stop payment temporarily.

Syndicate. A number of capitalists who unite to dispose of a loan, or to conduct a great financial enterprise.

Tacit. That which is understood; implied.

Tare. An allowance for weight of box, case, bag, cask, etc., containing merchandise.

Tariff. A list of prices; duties on imports and exports.

Tax. A rate or sum of money imposed on persons or property for public use.

Tenancy. The holding of property under tenure.

Tenant. One who holds lands of another as a tenant for life, for years, in tail, etc.; it is a word extensively used in legal phraseology.

Tender. A legal tender is an unconditional offer to

pay a debt, which, if refused, may be afterwards pleaded in bar to an action.

Tenement. Property held by a tenant; it comprises lands, houses, and every species of real property which may be held.

Tenure. The system of holding lands in subordination to some superiors.

Testamentary Guardian. A person appointed by a father in his will to be the guardian of his child.

Testator or Testatrix. The maker of a will.

Teste. The clause at the bottom of a writ beginning with the word "witness," is so called.

Tenants in Common. Persons holding lands and tenements by several and distinct titles, and not by a joint title.

Title. The evidence of the right which a person has to the possession of property.

Time Draft. A draft maturing at a future specified time.

Tonnage. Weight of a ship's load; capacity of a vessel. Also a duty on ships estimated per ton.

Traverse. A plea which denies the truth of some part of the plaintiff's declaration in an action.

Treasure Trove. Any money, etc., found hidden under the earth the owner thereof being unknown.

Trespass. Any wrong or damage which is done by one man to another, whether it relates to his person or property, but it usually signifies a wrongful entry on another's premises.

Trial. The formal method of examining and adjudicating upon a question of fact in a court of law.

Trover. The form of action used to try a disputed question of property in goods or chattels, in which the plaintiff can only recover their estimated value, and not the goods or chattels themselves.

True Bill. The words indorsed upon an indictment by a grand jury, when satisfied that the charge against the offender is made out.

Trust. A trust exists where a party, called the cestui que trust, has a right in equity to the beneficial enjoyment of property, the legal ownership of which is vested in another, who is hence called a trustee.

Transact. To perform any act of business; to manage.

Transfer. To convey; to sell or alienate title.

Treasury. A place where public money is kept.

Trustee. One to whom some special trust is assigned.

Trade. A company of persons engaged in the same occupation; business of buying and selling.

Trade Discount. A deduction of a certain rate per cent. from the face of a bill made by wholesale houses and others in trade.

Trade-Mark. A distinguishing mark used by a manufacturer on his goods or labels.

Trunk Lines. Through lines of railroad from the Atlantic seaboard to Chicago or more western points.

Trust. A combination of manufacturers or dealers for the purpose of limiting production and advancing prices for their own benefit.

Umpire. A third person chosen to decide a matter in dispute left to arbitration, in case the arbitrators should not agree.

Under-Lease. A lease granted by one who is himself only a lessee of the premises under-let.

Under-Lessee. The person to whom an under-lease is granted.

Unliquidated Damages. Damages not fixed or ascertained, and which require therefore to be estimated by a jury.

Uncurrent. Not passing in common payment, as pounds, shillings, and pence in the United States.

Underwriter. An insurer; so called because he underwrites his name to the conditions of the policy.

Use. A right to the beneficial enjoyment of land nominally vested in another.

Usury. The extortion of unlawful gain; the taking more for the use of money than is allowed by law; but the usury laws in this country are now abolished, any rate of interest therefore may now be lawfully taken.

Usage of Trade. Custom, or the frequent repetition of the same act in business transactions.

Usance. A fixed time on bills of exchange; business habit generally acted upon from force of custom.

Value Received. The words usually, but unnecessarily, appearing in bills of exchange and promissory notes.

Valid. Of binding force; strong; effectual

Value. The rate of worth or amount or price of a commodity.

Venditioni Exponas. A writ directed to the sheriff, commanding him to sell goods which he has taken possession of under a writ of *fiert facias*, and which remain in his hands unsold.

Vendor and Vendee. A vendor is the person who sells, and a vendee the person who buys, anything.

Venue. The county at which an action at law is intended to be tried.

Verdict. A verdict is the unanimous judgment or opinion of the jury on the issue of fact submitted to them.

Vend. To sell; to transfer for a pecuniary consideration.

Versus. Against.

Viva Voce. By word of mouth.

Voluntary Conveyance, or Settlement. A conveyance or settlement without any valuable consideration.

Voucher. A receipt or discharge.

Void. Having no binding force or effect.

Voidable. That which has some force or effect, but which, in consequence of some inherent quality, may be annulled or avoided.

Waifs. Stolen goods which the thief has thrown away or left behind him.

Ward. An infant under the guidance and protection of a guardian.

Warrant. An authority or precept from a justice, commanding the apprehension of an offender, or a search to be made for stolen goods.

Warrant of Attorney. An authority given by anyone to an attorney at law, to appear and plead for him;

or to suffer judgment to pass against him, by confessing the action.

Warranty. As applied to goods and chattels, may be either expressed or implied; the implied warranty only extends to the title of the vendor. If that proves deficient, the purchaser may demand satisfaction from the seller.

Watercourse, Right of. A right to an uninterrupted flow of water.

Way, Right of. The right of going over another man's ground.

Wages. Compensation for services.

Waiver. The relinquishment or refusal to accept of a right.

Wares. Goods; merchandise; commodities.

Wash Trades. Pretended trading. Trades made on an open market by parties between whom there is a tacit or private understanding that they shall be void. Done with a view to influence prices and considered a reprehensible practice.

Watered Stock. An increase in capitalization without a corresponding increase in assets.

Wharfinger. The owner or keeper of a wharf.

Will. A will is the legal written declaration of a man's intentions of what he wills to be performed after his death with reference to the disposition of his property. It must be in writing, signed by the testator, and attested by two witnesses, who must not only be present and see the testator sign, but must themselves subscribe the will as witnesses in the presence of the testator and of each other. Without these formalities the will is invalid. A codicil is a kind of addendum or supplement to a will. Its execution and attestation must be attended with the same formalities as the will itself.

European Cathedrals. — Among the most noted and magnificent cathedrals in Europe are St. Peter's, in Rome; the cathedral of Cologne, and that of Milan; St. Mark's, in Venice; Westminster and Salisbury, in England; Rouen and Notre Dame, in France; Seville and Strasburg, in Spain and Germany, respectively. St. Paul's, in London, though architecturally much inferior to the others, is yet so noted as to deserve a brief description. It is built in the form of a cross, 514 feet long and 287 feet wide. The cost of the whole building, which is of Portland stone, was nearly \$4,000,000, being the proceeds of a tax on the coal brought into the port of London during its erection. The edifice was built under the direction of Sir Christopher Wren, was thirty-five years in course of erection, and was commenced and finished under the same bishop, the same architect, and the same mason. The great bell of this cathedral is only tolled on the occasion of a death in the royal family. St. Peter's, at Rome, was commenced about the year 1503 by Julius II. under the direction of Bramante, but the present form of the basilica is due almost entirely to Michael Angelo. The interior is 613 feet in length, the height of the nave 152 1-2 feet; the length of the transepts is 446 1-2 feet; the interior diameter of the dome is 139 feet, the exterior 195 1-2 feet. The colonnades around the piazza inclose a space 787 feet in diameter, and are connected with the façade by two galleries 296 feet in length. The façade is 379 feet long, and 148 1-2 feet high, and contains five doors, which admit to the grand entrance, which occupies the whole width of the church, 468 feet long, 66 feet high, and 50 feet wide. The height from the pavement to the top of the cross is 476 feet. The Cologne cathedral is one of the noblest specimens of Gothic architecture in Europe. It is said to have had its origin in an erection by Archbishop Hildebold, during the reign of Charlemagne, in 814. Frederic the Red-bearded bestowed upon it, in 1162, the bones of the three holy kings, which he took from Milan, and this gift contributed greatly to the increase of its importance. The bones are retained as precious relics to this day, but the old structure was burned in 1248. According to some accounts the present cathedral was begun in the same year, but others fix the date of its commencement in 1270-'75. To whom the design of this noble building is to be ascribed is uncertain. The work was carried on, sometimes more actively, sometimes more

slowly, till the era of the Reformation, when it was suspended; and during the subsequent centuries not only was nothing done to advance it, but what had been already executed, was not kept in repair. In the beginning of the present century, however, attention was directed to its unrivaled beauties, and the necessary funds to repair and complete it according to the original designs were raised. The body of the church measures 500 feet in length, and 230 feet in breadth; the towers are above 500 feet high. Since 1823 \$4,500,000 have been expended on the building; the total cost of the whole is estimated at \$10,000,000. The cathedral at Milan is also of Gothic architecture, but the façade is marred by classic doors and windows, and the altars within are in the same style. The edifice is nearly 500 feet long, and 250 feet wide through the transepts, and the height of the nave is about 150 feet. The central spire is more than 350 feet high. The throng of statues (some 4,500 in all) and the many pinnacles are marked features of the exterior.

The celebrated church of St. Sophia, at Constantinople, was originally built by the Emperor Constantine in 325-326, and is so called as being dedicated, not, as commonly supposed, to a saint of that name, but to *Hagia Sophia* (Holy Wisdom); that is, to the Eternal Wisdom of God, or the Logos, the second person of the Trinity. The church was twice destroyed and rebuilt, the present edifice having been built by the Emperor Justinian about 532. It may be described as a square of 241 feet, forming interiorly a Greek cross, and surrounded in the interior by a woman's choir or gallery, supported by magnificent pillars, for the most part borrowed from ancient buildings. In the center rises a dome, which is supported by two great semi-domes, the whole presenting a series of unexampled beauty. The height of the dome is 175 feet. The building is approached by a double porch, which is about 100 feet in depth. The whole of the interior was richly decorated with sculptured marble and mosaics. The building occupied seven years in its erection, and the history of the work and of the details of its material and construction is full of marvels. Ten thousand workmen are said to have been employed upon it. The materials were supplied from every part of the empire, and comprised remains of almost every celebrated temple of the ancient paganism. The sedilia of the priests and those of the patri-

arches were of silver gilt. The dome of the tabernacle was of pure gold, and was surmounted by a gold cross weighing 75 pounds and incrustated with precious stones. All the sacred vessels and other apparatus were of gold. The altar cloths were embroidered with gold and pearls; and the altar itself was composed of a mass of molten gold, into which were thrown pearls, sapphires, diamonds, onyxes, and every other object which could raise its costliness to the highest imaginable degree. The total cost of the structure is stated by the ancient authorities at 320,000 pounds. Some regard this as pounds-weight of silver, others as of gold. If the latter, which is most generally adopted, the cost reaches the enormous sum of \$65,000,000. On the capture of Constantinople by the Turks in 1453 St. Sophia was appropriated as a mosque, and has since been put to that use.

Easter.—The festival of the Resurrection of Christ probably derives its Teutonic name from the festival of the goddess Ostara—in Anglo-Saxon, Eastre—which the Saxons of old were wont to celebrate about the same season at which the Christian festival of Easter occurs. In the second century a dispute arose as to the proper time for celebrating Easter between the Eastern and Western Churches. The great mass of Eastern Christians celebrated Easter on the 14th day of the first month or moon, considering it to be equivalent to the Jewish Passover, when Christ was crucified. The Western Christians celebrated it on the Sunday after the 14th, holding that it was the commemoration of the Resurrection of Jesus. The Council of Nice, A. D. 325, decided in favor of the Western usage. At the time of the introduction of the Gregorian Calendar it was debated whether Easter should continue a movable feast or whether a fixed Sunday after the 21st of March should not be adopted. In deference to the ancient custom, the ecclesiastical authorities decided to adhere to the method of determining the day by the moon. It must be understood, however, that it is not the actual moon in the heavens, nor even the mean moon of the astronomers, that regulates the time of Easter, but an altogether imaginary moon, whose periods are so contrived that the new (calendar) moon always follows the real new moon—sometimes by two, or even three days. The effect of this is that the 14th of the calendar moon—which had from the time of Moses been considered full moon for ecclesiastical purposes—falls generally on the 15th or 16th of the real moon, and thus after the real full moon, which is generally on the 14th or 15th day. With this explanation, then, of what is meant by “full moon” viz., that it is

the 14th day of the calendar moon, the rule is that Easter day is always the first Sunday after the Paschal full moon, i. e., the full moon which happens upon or next after the 21st of March; and if the full moon happens on a Sunday, Easter day is the Sunday after.

Apostles, Deaths of.—It is generally believed that only one of Christ's Apostles, John, escaped martyrdom. Matthew is supposed to have been slain with a sword in Ethiopia. James, son of Zebedee, was beheaded at Jerusalem. James, the brother of our Lord, was thrown from a pinnacle of the Temple and then beaten to death with a fuller's club. Philip was hanged up against a pillar at Hieropolis, a city of Phrygia. Bartholomew was flayed alive at Albanopolis, in Armenia. Andrew suffered martyrdom on a cross at Patræ, in Achaia. Thomas was run through the body with a lance at Coromandel, in the East Indies. Thaddeus was shot to death with arrows. Simon Zelotes was crucified in Persia. Peter was crucified, head downward during the Neronian persecution. Matthias was first stoned and then beheaded, and Paul was beheaded at Rome by the tyrant Nero. Judas Iscariot, after the betrayal of our Lord, hung himself.

Bible, English Translations of.—Between the eighth and tenth centuries portions of the Bible were translated into Anglo-Saxon by Aldhelin, Egbert, Bede, and others. In 1290 an English version of the Psalms was made. Wycliffe's version of the New Testament was finished in 1380, and a little later he completed the Old. The seven penitential Psalms were apparently printed in 1505. Before 1526 William Tyndale had completed an English translation of the New Testament. In the beginning of that year they were secretly conveyed to England from the Continent, where the translation had been made, where they were bought up and burned. The excellence of his translation is evidenced by the fact that in our present version a very large portion of the New Testament is taken *verbatim* from Tyndale's translation. In 1535 the first English version of the whole Bible was published by Miles Coverdale, a friend of Tyndale's, and was dedicated to Henry VIII. Between that year and 1557 several versions of the Bible were printed, but they were in the greater part revisions of Tyndale's previous work. The Geneva Bible, or, as best known, the Breeches Bible, appeared in 1557. It was translated by several English divines who had fled to Geneva to escape from the persecutions of Bloody Mary, and received the name of Breeches Bible on account of the rendering of Genesis iii, 7: “Then the eyes of both of

them were opened, and they knew that they were naked, and they sewed fig-tree leaves together and made themselves breeches." The Bishops' Bible was published in London in 1588. The text of this was compared with the original by eight bishops and seven other scholars of reputation, who appended their initials to their respective tasks. In 1582 appeared, at Rheims, in France, an English version of the New Testament, prepared by several Roman Catholic exiles, and in 1609-'10 a similar version of the Old Testament at Douay. They form the standard English Scriptures of the Roman Catholics, being generally known as the Douay Bible. In July, 1604, King James appointed fifty-four scholars to prepare a new version of the Bible. Only forty-seven accepted the appointment, and the result of their labors was the publication in 1610 of the version known as "King James's Bible," which has been in common use from that time to this, slightly modified by the revision prepared by the most learned English and American scholars a few years ago.

Benefit of Clergy.—Until the reign of Henry VI. all members of the clerical order were almost totally exempted from the jurisdiction and authority of the secular magistrate in respect of crimes and offenses. This was called "Benefit of the Clergy." If a priest or "clerk" happened to be imprisoned by the secular arm on a criminal charge, he was, on the demand of the bishop, instantly delivered up without any further inquisition—not to be let loose upon the community, it is true, but to be detained by the ordinary till he had either purged himself from the offense, or, having failed to do so, had been degraded. In the reign mentioned this was so far altered that the prisoner had first to be arraigned, but could arrest judgment by plea, declining the jurisdiction either before or after conviction. At first the test of admission to this singular privilege was the clerical dress and tonsure; but in course of time all who could read—a mark of great learning in those days—whether of the clergy or laity, were allowed the privilege. A layman, however, could only claim it once, and upon doing so was burned on the hand and discharged. He was then tried by the bishop, and usually acquitted, even though he had been previously convicted either by his country or his own confession. By this acquittal the offender was restored to his liberty, his credit, and his property—in short, in the eye of the law he became a new and innocent person. The test of reading was applied as follows: On conviction, the felon demanded his clergy, whereupon a book (commonly a Psalter) was put into his hand, which he was

required to read, when the judge demanded of the bishop's commissary, *Legit ut clericus?* If the answer was simply *legit*, the prisoner was burned on the hand and discharged; but if it was *non legit*, he suffered the punishment due to his offense. During the reign of Queen Anne the benefit of clergy was extended to all persons convicted of clergyable offenses, whether they could read or not, but it was discretionary with the judge whether a fine or imprisonment was inflicted. The benefit of clergy was totally abolished during the reign of George IV.

Catacombs.—Those in Paris were originally quarries which had existed under the city from the earliest time. In 1774 the Council of State issued a decree for removing the Cemetery of the Innocents, and for removing its contents, as well as those of other graveyards, into these quarries. These quarries—or catacombs, as they were called—were consecrated with great solemnity on April 7, 1786, and the work of removal from the cemeteries was immediately begun. The bones were brought at night in funeral cars, covered with a pall, and followed by priests chanting the service of the dead. At first the bones were heaped up without any kind of order except that those from each cemetery were kept separate; but in 1810, a regular system of arranging them was commenced, and the skulls and bones were built up along the wall. From the main entrance to the catacombs, which is near the Barriers d'Enfer, a flight of ninety steps descends, at whose foot galleries are seen branching in various directions. Some yards distant is a vestibule of octagonal form, which opens into a long gallery lined with bones from floor to roof. The arm, leg, and thigh bones are in front, closely and regularly piled, and their uniformity is relieved by three rows of skulls at equal distances. This gallery conducts to several rooms resembling chapels, lined with bones, variously arranged. One is called the "Tomb of the Revolution," another the "Tomb of Victims"—the latter containing the relics of those who perished in the early period of the Revolution and in the "massacre of September." It is estimated that the remains of fully 3,000,000 human beings lie in this receptacle. Owing to the unsafe condition of the roof, admission to the catacombs has been forbidden for years. Of the other catacombs in existence, the most celebrated are those on the Via Appia, at a short distance from Rome, where, it is believed, the early Christians were in the habit of retiring in order to celebrate their new worship in times of persecution. These catacombs consist of long, narrow galleries, usually about

eight feet high and five feet wide, which twist and turn in all directions, very much resembling mines, and at irregular intervals into wide and lofty vaulted chambers. The graves, where are buried many of the saints and martyrs of the primitive church, were constructed by hollowing out a portion of the rock at the side of the gallery large enough to contain the body. The catacombs at Naples, cut into the Capo di Monte, resemble those at Rome, and evidently were used for the same purpose, being in many parts literally covered with Christian symbols. In one of the large vaulted chambers there are paintings which have retained a freshness which is wonderful. Similar catacombs have been found at Palermo and Syracuse, and in Greece, Asia Minor, Syria, Persia, Egypt, and in Peru and other parts of South America.

Apocrypha, The.—In the earliest churches the word Apocrypha was applied with very different significations to a variety of writings; sometimes it was given those whose authorship and original form were unknown; sometimes to writings containing a hidden meaning; sometimes to those whose public use was not thought advisable. In this last signification it has been customary, since the time of Jerome, to apply the term to a number of writings which the Septuagint had circulated among the Christians, and which were sometimes considered as an appendage to the Old Testament, and sometimes as a portion of it. At the Council of Laodicea, about 360 A. D., the Apocryphal books were not named in the list of canonical books. In 474 Pope Gelasius convened a council of seventy bishops, which confirmed the opinion of Pope Innocent I., recognizing the Apocryphal books as sacred, and rejecting some of the doubtful books of the New Testament. The Council of Trent, 1545-'63, finally settled the question for the Roman Catholic Church, accepting the Apocrypha as a part of the sacred canon. The Apocrypha is still bound up between the authorized versions of the Old and New Testaments and is read as *lessons* in the public worship of all churches in communion with the Church of England but it is not used to establish any doctrines. In the other Protestant denominations the Apocrypha is rejected in public worship.

Inquisition, The, was a tribunal in the Roman Catholic Church for the discovery, repression, and punishment of heresy, unbelief, and other offenses against religion. From the very first establishment of Christianity as the religion of the Roman empire, laws more or less severe existed, as in most of the ancient religions, for the repression and punishment of

dissent from the national creed, and the Emperors Theodosius and Justinian appointed officials called "inquisitors," whose special duty it was to discover and to prosecute before the civil tribunals offenders of this class. For several centuries cases of heresy were tried before the ordinary courts, but in course of time the examination of those accused of this crime was handed over to the bishops. Special machinery for the trial and punishment of heretics was first devised in the eleventh and twelfth centuries against the various sects who had separated from the Church, and who became known under the general term of Albigenses. Heresy was then regarded as a crime against the state as well as the Church, and the civil, no less than the ecclesiastical, authorities were arrayed against those sects. The murder of a papal delegate in 1205 gave a pretext for declaring against the Albigenses a war in which thousands perished, and in 1299 the Council of Toulouse decreed the "Inquisition" for their extermination. The searching out of heretics was first given to the bishops of the Church, but the Pope (Gregory IX.), fearing that these would not be active enough, transferred their work to the Dominican friars. A guild was also formed called the "Militia of Jesus Christ," whose object was to aid inquisitors in their work. The Church found the heretics, examined, and sentenced them, and then called in the civil authority to put its sentence into execution. The inquisitorial courts at first only held occasional sessions, but after 1248 they sat permanently. A person, if suspected of heresy or denounced as guilty, was liable to be arrested and detained in prison, only to be brought to trial when it might seem fit to his judges. The proceedings were conducted secretly. He was not confronted with his accusers, nor were their names, even, made known to him. The evidence of an accomplice was admissible, and the accused himself was liable to be put to torture, in order to extort a confession of guilt. The punishments to which, if found guilty, he was liable, were death by fire, as exemplified in the terrible auto-da-fé, or on the scaffold, imprisonment in the galleys for life or for a limited period, forfeiture of property, civil infamy, and in minor cases retraction and public penance.

Inquisition, Spanish.—The Inquisition was introduced in Spain in 1232, by Pope Gregory's appointment of the Dominicans of Aragon as inquisitors, and it ultimately came to be viewed by the people with most abject terror. At first it passed no sentence more severe than the confiscation of property, but toward the close of the fifteenth century,

the zeal of Mendoza, the archbishop of Seville, gave a new impulse to the institution. At that time there was a real or pretended alarm lest the Jews and Moors in Spain should unite against the Christians. Bishop Mendoza proposed to King Ferdinand, in 1477, that an inquisition should be established in Castile, with the primary object of searching out the Jews who had relapsed into Judaism after having professed Christianity, or who simply feigned conversion. The Inquisitorial Court of Seville was established in September, 1480, in the person of two Dominican friars. Torquemada, another Dominican, appointed in 1483, was Grand Inquisitor for fifteen years. Under him three new tribunals of the Holy Office were erected at Cordova, Jaen, and Villa Real; afterwards a fifth was added to Toledo. These Tribunals were always popular with the lower orders and the clergy in Spain, but terrible in the eyes of the nobles and the rich middle class, who believed that they were often used by the Government as engines of political repression in order to diminish their influence. Ranke calls the Spanish Inquisition "a royal tribunal furnished with spiritual weapons." In 1492 an edict was issued for the banishment of all Jews refusing to embrace Christianity from Spain, chiefly on account of their alleged incorrigible obstinacy in persisting in the attempt to convert Christians to their own faith and instruct them in their rites. About a hundred thousand accordingly went into banishment.

The history of the Spanish Inquisition was written by Llorente, who was secretary to the tribunal of Madrid from 1790 to 1792. Although he is supposed to have possessed great opportunities for obtaining exact information, his estimate of the persons condemned to death is now considered very much exaggerated. The figures of Llorente include not only those condemned for heresy, but besides persons charged with many other crimes, such as polygamy, seduction, unnatural crime, smuggling, witchcraft, sorcery, imposture, etc., civil offenses within the jurisdiction of the Inquisition and punishable with death.

The celebrated *Autos-da-Fe* (Acts of the confession of the faith), says Möhler, "were as a rule bloodless. But few inquisitorial processes terminated with the death of the accused." The *Auto*, speaking generally, was a form of reconciling culprits to the Church. Nevertheless the severities practiced by the tribunals were such that Rome frequently interfered. By the beginning of the seventeenth century, the Inquisition, having largely obliterated heresy in Spain, became more lenient; its efforts were then principally directed against heretical

books, and occasionally decreed an execution. The jurisdiction of the Inquisition had been greatly restricted when Joseph Bonaparte abolished it in December, 1808. It was restored by Ferdinand VII. in 1814, but was again abolished by the Constitution of the Cortes in 1820. After the second restoration a tribunal was re-established at Valencia in 1826. It was finally abolished, however, in 1834, and in 1835 all its property was confiscated for the public debt.

Celibacy in the Roman Catholic Church.—Previous to the close of the fourth century there was no law nor uniformity of opinion regarding the celibacy of the Romish priests. About this time, however, Pope Siricius forbade priests to marry, and those who had married previous to ordination were commanded to put away their wives. Children born to a clergyman after ordination were declared by the Emperor Justinian to be illegitimate and incapable of inheritance. This doctrine was opposed by the Eastern Church, and in 692 it was condemned as heretical by the Council of Constantinople, and the marriage of priests has, therefore, always been sanctioned by the Orthodox Greek Church. Notwithstanding the action taken by the Romish Church, it was several centuries before celibacy was firmly established, and this was not accomplished until Pope Gregory VII., in the face of violent opposition in all countries, deposed all married priests and excommunicated all laymen who upheld them in the exercise of their spiritual functions. This decree was carried out with the utmost rigor, and brought about the result which the Church had been aiming at for centuries, and which still continues to be the canonical law.

Indulgences.—Originally, indulgences meant a release from the temporal penalties which remained due after the sin itself had been remitted by confession and absolution, and were granted during the first centuries of the Christian churches, not only by the pope, but by all bishops, to infirm persons or to those penitents who showed extraordinary contrition. An indulgence cannot be granted for unforgiven sin. It is not the remission of sin nor of the eternal punishment due to mortal sin, still less is it a permission to commit sin in the future. Before an indulgence can be gained, sin must have been previously remitted by repentance. Thus, instead of being an encouragement to sin, it is a strong motive to repentance. Many indulgences have been abrogated, or declared apocryphal by the Roman Catholic Church. The Council of Trent prohibited the "disreputable gains" made at some places at the expense of those who desired to obtain indul-

gences. The same council prescribes that all indulgences must be granted "*gratis*."

Cambridge, University of, is situated at the town of Cambridge, forty-eight miles northeast of London. The first regular society of students was that of Peter-House, founded in 1257. The history of the University, however, may be said to date from the opening of the twelfth century, but until the year mentioned there were no public halls or hostels, each student living in his own hired lodging. About 1257 the students began to live together in hostels, under the rule of a principal. These hostels were named after the saints to whom they were dedicated, the churches which they adjoined, or the persons who formerly built or possessed them. In the year 1280 there were as many as thirty-four, and some of them contained from twenty to forty masters of arts, and a proportionate number of younger students. These hostels were the beginning of what may be called the college system, which distinguishes the sister universities of Oxford and Cambridge from those of Edinburgh, London, and the Continent. All the royal and religious foundations, with one exception, which now constitute the University were endowed between the latter part of the thirteenth and the close of the sixteenth century. The governing body of the university is the senate; but, before being submitted to it, all university laws must be approved by the council, a body elected by the resident members of the senate. After the chancellor and high steward, the chief executive power is vested in the vice-chancellor, who is elected annually from the heads of colleges. There are three terms in this university — the Michaelmas, or October term; the Lent term, and the Easter term. To take an ordinary B.A. degree, a student must reside nine terms. The M.A. degree follows, without examination, about four years after. There are four classes of students — Fellow Commoners and Noblemen, Pensioners, Sizars and Subsizars, and the more distinguished, who are elected Scholars on the foundation of this college. The pensioners are the great body of students, are not on the foundation, and pay for their own commons, viz., dinners in halls, etc., and for their rooms. The sizars are poorer students, selected, however, by examination, who receive free commons and certain money payments, and are admitted at lower charges than the pensioners, but wear the same dress and are no longer subject to the performance of menial offices, as they once were. The scholars are elected, by examination, from the pensioners and sizars. They are on the foundation of the college, from which they receive certain emoluments. The

fellows are subsequently elected from the scholars and the students who have distinguished themselves in the Tripos examinations. The University has forty professors, in addition to readers, demonstrators, and assistants. The tutor of the college is understood to be *in loco parentis* to his pupils, the dean has the oversight of "religion and morals," and instruction is given by college lecturers. The great prizes at the University are the Fellowships, of which there are about four hundred. The following is a list of the colleges and their founders: St. Peter's College or Peter-House, founded by Hugh de Balsham, Bishop of Ely, 1257; Clare College, founded under the name of University Hall by Richard Baden in 1326, was burned in 1338, and rebuilt and endowed by Elizabeth, Countess of Clare; Pembroke College, founded by the Countess of Pembroke, 1347; Gonville and Caius College, founded by Edward Gonville in 1348; Trinity Hall, founded by William Bateman, Bishop of Norwich, 1350; Corpus Christi or Benedict College, founded by the guilds of Corpus Christi and the Blessed Virgin, 1351; King's College, founded by Henry VI., 1441; Queens' College, founded by Margaret of Anjou, wife of Henry VI., 1446; St. Catherine's College or Hall, founded by Robert Wodelarke, provost of King's College, 1473; Jesus College, founded by John Alcock, Bishop of Ely, 1496; Christ College, founded by the Countess of Richmond, 1505; St. John's College, founded by the Countess of Richmond, 1511; Magdalene College, founded by Thomas, Baron Audley, of Walden, 1519; Trinity College, founded by Henry VIII., 1546; Emmanuel College, founded by Sir Walter Mildmay, 1584; Sidney Sussex College, founded by Lady Frances Sidney, 1598; Downing College, founded by Sir George Downing, 1800.

Oxford University is one of the two greatest seats of learning in Great Britain. It is situated at Oxford, fifty-two miles from London, and comprises twenty colleges and six halls — the latter for the residence of students. The colleges, their founders, and the dates thereof, are as follows: University College, founded by William of Durham, 1249; Balliol, by John Balliol and Devorgilla, his wife, between 1263 and 1268; Merton, by Walter de Merton, Bishop of Rochester, at Malden, in 1264, and removed to Oxford before 1274; Exeter, by Walter de Stapleton, Bishop of Exeter, 1314; Oriel, by Edward II., 1326; Queen's, by Robert Eglesfield, chaplain to Philippa, queen of Edward III., 1340; New, by William of Wykeham, Bishop of Winchester, 1386; Lincoln, by Richard Fleming, Bishop of Lincoln, 1427; All Souls', by Henry

Chiohele, Archbishop of Canterbury, 1437; **Magdalen**, by William of Waynflete, Lord Chancellor, 1456; **Brasenose**, by William Smith, Bishop of Lincoln, 1509; **Corpus Christi**, by Richard Fox, Bishop of Winchester, 1516; **Christ Church**, by Henry VIII., 1546-'47; **Trinity**, by Sir Thomas Pope, 1554; **St. John's**, by Sir Thomas White, 1555; **Jesus**, by Queen Elizabeth, 1571; **Wadham**, by Nicholas Wadham, 1613; **Pembroke**, by James I., at the expense of Thomas Tisdale and Richard Wrightwick, 1620; **Worcester**, by Sir Thomas Cookes, 1714; **Keble** as a memorial to the Rev. John Keble, by public subscription, in 1870.

Adam and Eve.—To the Scriptural account of the creation and fall of Adam and Eve, the later Jewish writers in the Talmud have made many additions. According to them, the stature of Adam, when first created, reached to the heavens, while the splendor of his countenance surpassed that of the sun. The very angels stood in awe of him, and all creatures hastened to worship him. Then the Lord, in order to show the angels his power, caused a sleep to fall upon Adam, and removed a portion of every limb. He thus lost his vast stature, but remained perfect and complete. His first wife was Lilith, the mother of demons; but she fled from him, and afterward Eve was created for him. At the marriage of Adam and Eve angels were present, some playing on musical instruments, others serving up delicious viands, while the sun, moon, and stars danced together. The happiness of the human pair excited envy among the angels, and the seraph Sammael tempted them, and succeeded in leading them to their fall from innocence. According to the Koran, all the angels paid homage to Adam excepting Eblis, who, on account of his refusal, was expelled from Paradise. To gratify his revenge, Eblis seduced Adam and Eve, and they were separated. Adam was penitent, and lived in a tent on the site of the Temple of Mecca, where he was instructed in the divine commandments by the Archangel Gabriel. After two hundred years of separation, he again found Eve on Mount Arafat.

Celebrated Paintings.—It is generally agreed by art critics that Michael Angelo and Raphael stand at the head of the line of master painters. Conspicuous among the great paintings of the former are "The Last Judgment," "The Conversion of St. Paul," and "The Crucifixion of St. Peter"; and among those of the latter, "The Dispute Concerning the Sacrament," the "Madonna di Foligno," and the "Madonna del Pisce, or Virgin of the Fish." "The Last Judgment" is a large

fresco-painting, sixty feet high by thirty feet wide, occupying the wall opposite the entrance of the Sistine Chapel, in the Vatican Palace at Rome. Over three hundred figures are represented in "the most violent attitudes and most admired disorder." "The Conversion of St. Paul" is another large fresco-painting in the Vatican. "The Crucifixion of Peter," also in the Vatican, is one of the last from the hands of Angelo. "The Dispute Concerning the Sacrament" is a fresco, representing, above, a convocation of the saints around the Almighty, the Saviour, and the Virgin, enveloped in heavenly glory, while beneath the ceremony of the Consecration of the Sacrament is depicted. This is found in the Camera della Segnatura of the Vatican. "The Madonna di Foligno," in the Vatican gallery, derives its name from the city of Foligno, which is represented in the background. The "Madonna del Pisce," now in the gallery at Madrid, Spain, represents the Virgin and Child enthroned, with St. Jerome on one side, and on the other an archangel with the young Tobit, who carries a fish, from which circumstance the name is derived. "The Madonna di San Sisto" is considered by many critics the best of Raphael's works. It is located in the gallery of Dresden, Germany, and represents the Madonna standing upon the clouds surrounded with glory, holding in her arms the eternal son. Saint Sixtus and Saint Barbara kneel at the sides. It was originally painted on wood, but has been transferred to canvas. The painting of "The Last Supper," by Leonardo da Vinci, is recognized as one of the masterpieces. It was originally painted, by order of the Duke of Milan, on the walls of the refectory in the Dominican convent of the Madonna della Grazie. Rubens' paintings of the "Descent from the Cross" and "Elevation of the Cross," at Antwerp, rank high as masterpieces. The "Adoration of the Trinity," by Albert Durer, at Vienna, and his two pictures containing life-size figures of Peter and John, Mark and Paul, presented to the Council of Nuremberg, Germany, are also very famous. The two pictures of Mary Magdalen are also among the most famous in the world—"La Bussendi Magdalina," by Corregio, now in the Dresden Gallery, and one by Guido Reni.

Venus, Statues of.—The Roman goddess of love and beauty, subsequently identified with the Greek Aphrodite, was a favorite subject of ancient sculptors. The most famous specimen still existing is the *Venus de Medici*, executed by Cleomenes, the Athenian, about 200 B. C., and generally admitted to be the finest relic of ancient art. It was dug up in several pieces, either at the villa of Hadrian,

near Tivoli, or at the Portico of Octavia, in Rome, in the seventeenth century. After remaining for some time in the Medici Palace in Rome (whence its name) it was carried to Florence by Cosmo III., about 1680, where it is now preserved in the Uffizi Gallery. From the exquisite grace and symmetry of the figure it has become a sort of standard of excellence for the female form. The beautiful Venus de Milo is so called because it was found on the Island of Milo, or Melos, in the Grecian Archipelago. It is now in the Louvre, at Paris. Of modern statues, that by Canova is the most famous.

Buddhism.—The religion known as Buddhism is one of the oldest existing religions, and traces its origin back to Siddhartha or Buddha, a Hindoo prince. In Hindustan, the land of its birth, it has now little hold, except among the Nepalese and some other northern tribes, but it bears full sway in Ceylon and over the whole eastern peninsula. It divides the adherence of the Chinese with the system of Confucius. It prevails also in Japan and north of the Himalayas. It is the religion of Thibet, and of the Mongolian population of Central Asia. Its adherents are estimated at 340,000,000. According to the Buddhist belief, when a man dies he is immediately born again, or appears in a new shape; and that shape may, according to his merit or demerit, be any of the innumerable orders of being composing the Buddhist universe, from a clod to a divinity. If his demerit would not be sufficiently punished by a degraded earthly existence—in the form, for instance, of a woman or a slave, of a persecuted or a disgusting animal, of a plant, or even of a piece of inorganic matter—he will be born in some one of the one hundred and thirty-six Buddhist hells situated in the interior of the earth. These places of punishment have a regular gradation in the intensity of the suffering and in the length of time the sufferers live, the least term of life being 10,000,000 years, the longest term being almost beyond the powers of even Indian notation to express. A meritorious life, on the other hand, secures the next birth either in an exalted and happy position on earth or as a blessed spirit, or even divinity, in one of the many heavens in which the least duration of life is about 10,000,000,000 years. But however long the life, whether of misery or bliss, it has an end, and at its close the individual must be born again, and may again be either happy or miserable. The Buddha himself is said to have gone through every conceivable form of existence on the earth, in the air and in the water, in hell and in heaven, and to have filled every condition in human life; and a great part of the Buddhist

legendary literature is taken up in narrating his exploits when he lived as an elephant, as a bird, as a stag, and so on. A second Buddhist doctrine is embodied in the "Four Sublime Verities." The first asserts that pain exists; the second that the cause of pain is desire or attachment; the third that pain can be ended by *Nirvana*; and the fourth shows the way that leads to *Nirvana*, from simple faith to complete regeneration. Theoretically this religion has no priests, nor clergy, nor public religious rites. Every man is his own priest and confessor, and the monks are ascetics only for their own advancement in holy living; but in fact Buddhist countries swarm with priests or religious teachers, so reputed. The central object in a Buddhist temple, corresponding to the altar in a Roman Catholic church, is an image of the Buddha, or a dagoba or shrine containing his relics. Here flowers, fruit, and incense are daily offered, and processions are made, with singing of hymns. Of the relics of the Buddha, the most famous are the teeth, that are preserved with intense veneration in various places. The quantities of flowers used as offerings are prodigious. A royal devotee in Ceylon, in the fifteenth century, offered on one occasion 6,480,320 flowers at the shrine of the tooth, and at one temple it was provided that there should be offered "every day 100,000 flowers, and each day a different flower."

Eden, Garden of.—The question of the locality of the Garden of Eden, or of the exact sense in which the Mosaic narrative is to be understood, is involved in inexplicable mystery. Josephus and several of the Fathers conceived that Eden was a term denoting the entire region between the Ganges and the Nile. Calvin, Huet, Bochart, and Wells have, with slight differences of detail, concluded in favor of Kornah, in Babylonia, not far from the Persian Gulf; while Armenia, near the sources of the Tigris and Euphrates, and the region near Damascus, have been selected by other celebrated scholars. The modern German school of Biblical critics, convinced that the Hebrew account is traditional, and, in its present form, of very late composition, and impressed, beside, with the vast antiquity of the far East, have, almost without exception, sought the cradle of the human race in Bactria or Cashmere, or the region lying to the north of it, a part of which is to this day called Audyana, the Garden. The Mohammedans, it may also be mentioned, believe Eden to have been in one of the seven heavens—some say the moon—and that the expulsion from Paradise consisted in Adam being cast down upon the earth after the fall. The endeavor to positively identify the river system of Eden with

anything known at present is useless. There is no river on the face of the globe of which the Euphrates and Tigris (Hiddekel) are separate "heads," as they are said to be in the second chapter of Genesis; for, although the Euphrates and Tigris now unite for a short space on their way to the Persian Gulf, yet until the time of Alexander the Great they kept entirely distinct courses, and therefore it has been assumed that the Deluge completely altered the physical character of the region denoted by the term Eden. This was Luther's notion, to which, however, it has been objected that the narrative in Genesis is so worded as to convey the idea that the countries and rivers spoken of were existing in the time of the historian. Besides, the science of geology has thrown so much doubt on the universality of a deluge so late as the period assigned to Noah that it is hazardous to argue on the hypothesis of any extensive physical changes having taken place since the first appearance of man on the planet—at least if that be dated only some six thousand years back. In all the theories which have been advanced regarding the location of Eden two things have not been explained by anyone; these are the statement that the four rivers flow from one river, and the river Pison "compasseth the whole land of Havilah." Until these are solved the location of the Garden of Eden will continue to remain a mystery.

Diet of Worms was an assembly convoked by Emperor Charles V., for the purpose of considering state affairs, and principally the course to be pursued toward the Reformation and Martin Luther. It was composed of the princes and other leading representatives of the several states of the German Empire. Luther appeared before this august body, and his defense of himself and his followers against the charge of heresy was dignified and eloquent, and compelled the admiration of the assembly and many of his former foes. He was allowed to leave the city under escort, and at the instigation of his friend, the Elector of Saxony, who feared that he might be assassinated if he continued in active life, he was taken to the Castle of Wartburg, where he remained, virtually a prisoner, for about one year. When his adherents had become numerous enough and strong enough for him to advocate his principles without fear of molestation, he was restored to liberty.

Confucianism is termed a religion, but it ought rather to be regarded as a system of social and political life, built upon a slight foundation of philosophy. It contains no trace of a personal God. There are, indeed, a number of allusions to a certain heavenly agency or power—Shang-te—whose outward

emblem is Tien, or the visible firmament; but this Shang-te, in the opinion of the most enlightened Chinese scholars, is nothing more than a verbal personification of "the ever-present Law and Order and Intelligence which seem to breathe amid the wonderful activities of physical creation, in the measured circuit of the seasons, in the alternation of light and darkness, in the ebb and flow of tides, and in the harmonious and majestic revolutions of the heavenly bodies." Confucius lived about 550 B. C. He strove to direct the attention of men to the duties of social and political life, and Confucianism is epitomized in the following words of the great teacher: "I teach you nothing but what you might learn yourselves, viz., the observance of the three fundamental laws of relation between sovereign and subject, father and child, husband and wife, and the five capital virtues—universal charity, impartial justice, conformity to ceremonies and established usages, rectitude of heart and mind, and pure sincerity." Confucianism appeals to "practical" men. It lauds the present world; rather doubts, than otherwise, the existence of a future one; and calls upon all to cultivate such virtues as are seemly in citizens—industry, modesty, sobriety, gravity, decorum, and thoughtfulness.

Millennium.—The idea of the millennium, literally a thousand years' time, originated proximately in the Messianic expectation of the Jews; but more remotely, it has been conjectured, in the Zoroastrian doctrine of the final triumph of Ormuzd over Ahriman, and was connected by the Christians with the second coming of Christ. The notion of a golden age, preserved by the converts from heathenism to Christianity, as well as the oppression and persecution to which they were long subjected by the state authorities, were naturally calculated to develop and strengthen such hopes. The chief basis of the millennium idea in Judaism, as well as in Christianity, however, is the ardent hope for a visible Divine rule upon earth, and the identification of the Church with that of which it is merely a symbol. In the Mosaic account of creation we find the primitive ground for making the victorious era of the Church last a thousand years. By a strictly literal interpretation of the 4th verse of the 90th Psalm it was supposed that a day of God was arithmetically equal to a thousand years; hence the six days of creation were understood to indicate that the earth would pass through 6,000 years of labor and suffering, to be followed by a seventh day—that is, 1,000 years of rest and happiness. In the book of Revelation this view is presented. Still, the rabbinical tradi-

tions differ widely among themselves as to the duration of the happy period. During the civil and religious wars in France and England the belief in millenarianism was prominent. The Fifth-monarchy men of Cromwell's time were millenarians of the most exaggerated and dangerous sort, and marked by extreme arrogance. Their peculiar tenet was that the millennium *had* come and *they* were the saints who were to inherit the earth. Great eagerness and not a little ingenuity have been exhibited by many persons in fixing a date for the commencement of the millennium. The celebrated theologian Johann Albrecht Bengel asserted, from a study of the prophecies, that the millennium would begin in 1836. This date was long popular. Swedenborg held that the last judgment took place in 1757, and that the new Church, or "Church of the New Jerusalem," as his followers designate themselves — in other words, the millennium era — then began. In America considerable agitation was excited by the preaching of one William Miller, who fixed the second advent of Christ about 1843. Of late years the most noted millenarian was Dr. John Cummings of England, who originally placed the end of the present dispensation in 1866 or 1867; but as the time drew near without any millennial symptoms, he was understood to have modified his views considerably, and came to the belief that the beginning of the millennium will not differ so much, after all, from the years immediately preceding it as people commonly suppose.

Ecole Polytechnique, a celebrated military academy of France, established in 1794 through the instrumentality of M. Lamblardie, director of the *Ponts et Chaussées*. The academy was first called the *Ecole Centrale des Travaux Publics*; but in the following year, 1795, the name was changed to *Ecole Polytechnique*, and numerous alterations were made in its organization. It was dissolved in 1816, again in 1830, and again in 1832, on account of the impetuous way in which the scholars mixed themselves up with the political disturbances of those years; but it was re-established on each occasion, after the restoration of tranquillity. Candidates are admitted by competitive examination, which takes place yearly. To be eligible as a candidate the youth must be French, and must be more than sixteen and less than twenty years of age before the first of January following; but soldiers are admissible up to twenty-five, provided they can give proof of service in the regular army. The course of instruction lasts for two years, when graduates have the privilege of choosing, from the various public services supplied from

this school, the particular branch they wish to enter. The school was last reorganized by a decree of the 15th of April, 1873.

Benedictines, as the order of monks were called who followed the rule of St. Benedict, are regarded as the main agents in the spread of Christianity, civilization, and learning in the west. At one time the order is said to have had as many as 87,000 monasteries, and counted among their branches the great Order of Clugny, founded about 910; the still greater Order of the Cistercians, founded in the following century; the congregations of Monte Cassino in 1408, of St. Vanne in 1600, and of St. Maur on the Loire in 1627. All the Benedictine houses in France were affiliated to this last congregation. Among the monks of St. Maur were many noted scholars, and the services they rendered to literature it would be difficult to overestimate. At the Revolution in 1792 the Benedictines were suppressed in France and their splendid conventual buildings were destroyed, but the order was revived later. Most of the richest abbeys and all the cathedral priories (excepting Carlisle) in England belonged to the Benedictines, and they had numerous monasteries in Scotland. The Benedictines gained great distinction in both Italy and Germany — in the former as literati, jurists, and physicians, and in the latter as promoters of education and as the founders of mediæval scholasticism. As early as 1354 this order could boast of having numbered among its followers 24 popes, 200 cardinals, 7,000 archbishops, 15,000 bishops, 1,560 canonized saints, and 5,000 holy persons judged worthy of canonization, besides 20 empresses, 47 kings, above 50 queens, 20 sons of emperors, 48 sons of kings, 100 princesses, and an immense number of the nobility. In the fifteenth century the order had 15,107 monasteries, of which only 5,000 were left after the Reformation, and there are now not more than 800. They were commonly styled the "Black Monks" from their dress, a long black gown with a cowl or hood of the same, and a scapulary. The rule of St. Benedict was much less severe than that which the eastern ascetics followed. Besides implicit obedience to their superiors, the Benedictines were to shun laughter, to hold no private property, to live sparsely, to exercise hospitality, and, above all, to be industrious.

ARCHITECTURE.

Architecture, or the art of planning and raising edifices, appears to have been among the earliest inventions. The first habitations of men were such as nature afforded, with but little labor on the part of the occupant, and sufficient to supply his simple wants — grot-

toes, huts, and tents. In early times, the country of Judea, which is mountainous and rocky, offered cavernous retreats to the inhabitants, who accordingly used them instead of artificial places of shelter. From various passages in scripture, it appears that these caves were often of great extent, for, in the sides of the mountain of Engedi, David and six hundred men concealed themselves. In the course of time, art was employed to fashion the rude cavernous retreats, and to excavate blocks by which rude buildings were compiled in more convenient situations. The progress of architecture, however, from its first dawn, differed in almost every different locality. Whatever rude structure the climate and materials of any country obliged its early inhabitants to adopt for their temporary shelter, the same structure, with all its prominent features, was afterward kept up by their refined and opulent posterity.

From the cause now mentioned the Egyptian style of building had its origin in the cavern and mound; the Chinese architecture, with its pavilion roofs and pointed minaret, is molded from the Tartar tent; the Grecian is derived from the wooden cabin; and the Gothic from the bower of trees. It is evident that necessity as much as choice or chance led to the adoption of the different kinds of edifices.

After mankind had learned to build houses, they commenced the erection of temples to their gods, and these they made still more splendid than private dwellings. Thus architecture became a fine art, which was first displayed on the temples, afterward on the habitations of princes and public buildings, and at last became a universal want in society.

Traces of these eras of advancement in the art of erecting buildings are found in various quarters of the globe, especially in Eastern countries, where the remains of edifices are discovered of which fable and poetry can alone give any account. The most remarkable of these vestiges of a primitive architecture are certain pieces of masonry in the island of Sicily, as well as in some other places, called the works of the Cyclops, an ancient and fabulous race of giants, mentioned by Homer in his *Odyssey*. By whom these walls were actually erected is unknown.

Of the progressive steps from comparative rudeness to elegance of design, history affords no certain account, and we are often left to gather facts from merely casual notices. The most ancient nations known to us among whom architecture had made some progress where the Babylonians, whose most celebrated buildings were the temple of Belus, the palace

and the hanging gardens of Semiramis; the Assyrians, whose capital, Nineveh, was rich in splendid buildings; the Phœnicians, whose cities, Sidon, Tyre, Aradus, and Sarepta, were adorned with equal magnificence; the Israelites, whose temple was considered as a wonder of architecture; the Syrians and the Philistines. No architectural monument of these nations has, however, been transmitted to us; but we find subterraneous temples of the Hindoos, hewn out of the solid rock, upon the islands Elephanta and Salsette, and in the mountains of Elora. These temples may be reckoned among the most stupendous ever executed by man. The circuit of the excavations is about six miles. The temples are 100 feet high, 145 feet long, and 62 feet wide. They contain thousands of figures, appearing, from the style of their sculpture, to be of ancient Hindoo origin. Everything about them, in fact, indicates the most persevering industry in executing one of the boldest plans.

Egyptian Architecture. — All the architectural remains of ancient times sink into insignificance when compared with those of Egypt. The obelisks, pyramids, temples, palaces, and other structures of this country, are on the grandest scale, and such as could only have been perfected by a people considerably advanced in refinement. The elementary features of Egyptian architecture were chiefly as follows: 1. Their walls were of great thickness, and sloping on the outside. This feature is supposed to have been derived from the mud walls, mounds, and caverns of their ancestors. 2. The roofs and covered ways were flat, or without pediments, and composed of blocks of stone, reaching from one wall or column to another. The principle of the arch, although known to the Egyptians, was seldom if ever employed. 3. Their columns were numerous, close, short, and very large, being sometimes ten or twelve feet in diameter. They were generally without bases, and had a great variety of capitals, from a simple square block, ornamented with hieroglyphics, or faces, to an elaborate composition of palm leaves, not unlike the Corinthian capital. 4. They used a sort of concave entablature or cornice, composed of vertical flutings or leaves, and a winged globe in the center. 5. Pyramids, well known for their prodigious size, and obelisks, composed of a single stone, often exceeding seventy feet in height, are structures peculiarly Egyptian. 6. Statues of enormous size, sphinxes carved in stone, and sculptures in outline of fabulous deities and animals, with innumerable hieroglyphics, are the decorative objects which belong to this style of architecture.

The main character of Egyptian architecture is that of great strength with irregularity of taste. This is observable in the pillars of the temples, the parts on which the greatest share of skill has been lavished. The temple of Karnak is an example.

In these columns we may notice that sturdiness is the prevailing characteristic. The design has been the support of a great weight, and that without any particular regard to proportion or elegance, either as a whole or in parts. When assembled in rows or groups, the columns had an imposing effect, because, from their height and thickness, they filled the eye and induced the idea of placid and easy endurance.

Grecian Architecture.—From Egypt, the architectural art spread to Greece, where it passed from the gigantic to the chaste and elegant. The period in which it flourished in the greatest perfection was that of Pericles, about 440 before Christ, when some of the finest temples at Athens were erected. After this, it declined with other arts, and was carried to Rome, where, however, it never attained the same high character.

Aided doubtless by the examples of Egyptian art, the Greeks gradually improved the style of architecture, and originated those distinctions which are now called the "Orders of Architecture." By this phrase is understood certain modes of proportioning and decorating the column and its entablature. They were in use during the best days of Greece and Rome, for a period of six or seven centuries. They were lost sight of in the dark ages, and again revived by the Italians at the time of the restoration of letters. The Greeks had three orders, called the Doric, Ionic, and Corinthian. These were adopted and modified by the Romans, who also added two others called the Tuscan and Composite.

The Doric Order.—This is the earliest of the Greek orders, and we see in it a noble simplicity on which subsequent orders were founded. The shaft of the Doric column had no base, ornamental or otherwise, but rose directly from the smooth pavement or stylobate. It had twenty flutings, which were superficial, and separated by angular edges. The perpendicular outline was nearly straight. The Doric capital was plain, being formed of a few annulets or rings, a large echinus, and a flat stone at top called the abacus. The architrave was plain; the frieze was intersected by oblong projections called triglyphs, divided into three parts by vertical furrows, and ornamented beneath by guttæ, or drops. The spaces between the triglyphs were called metopes and commonly contained sculptures. To

have a just idea of the Doric, therefore, we must go back to the pure Grecian era. The finest examples are those of the temple of Theseus and the Parthenon at Athens. The Parthenon, which is now a complete ruin, has formed a model in modern architecture. It was built by the architect Ictinus, during the administration of Pericles, and its decorative sculptures are supposed to have been executed under direction of Phidias. The platform or stylobate consists of three steps, the uppermost of which is 227 feet in length and 101 in breadth. The number of columns is eight in the portico of each front, and seventeen in each flank, besides which there is an inner row of six columns, at each end of the cell.

The Ionic Order.—In this order the shaft begins to lengthen, and to possess a degree of ornament, but still preserving a great degree of simplicity of outline. In the best examples, as in the Parthenon, the column was eight or nine diameters in height. It had a base often composed of a torus, a scotia, and a second torus, with intervening fillets. This is called the Attic base. Others were used in different parts of Greece. The capital of this order consisted of two parallel double scrolls, called volutes, occupying opposite sides, and supporting an abacus, which was nearly square, but molded at its edges. These volutes have been considered as copied from ringlets of hair, or perhaps from the horns of Jupiter Ammon. The Ionic entablature consisted of an architrave and frieze, which were continuous or unbroken, and a cornice of various successive moldings, at the lower part of which was often a row of dentils, or square teeth. The examples at Athens of the Ionic order were the temple of Erectheus, and the temple on the Ilissus, both now destroyed. Modern imitations are common in public edifices.

The Corinthian Order.—This was the lightest and most highly decorated of the Grecian orders. The base of the column resembled that of the Ionic, but was more complicated. The shaft was often ten diameters in height, and was fluted like the Ionic. The capital was shaped like an inverted bell, and covered on the outside with two rows of leaves of the plant acanthus, above which were eight pairs of small volutes. Its abacus was molded and concave on its sides, and truncated at the corners, with a flower on the center of each side. The entablature of the Corinthian order resembled that of the Ionic, but was more complicated and ornamented, and had, under the cornice, a row of large oblong projections, bearing a leaf or scroll on their under side, and called modillions. No vestiges of this order are now found in the remains

of Corinth, and the most legitimate example at Athens is in the choragic monument of Lysicrates. The Corinthian order was much employed in the subsequent structures of Rome and its colonies. The finest Roman example of this order is that of three columns in the Campo Vaccina, at Rome, which are commonly considered as the remains of the temple of Jupiter Stator.

Caryatides.—The Greeks sometimes departed so far from the strict use of the orders as to introduce statues, in the place of columns, to support the entablature. Statues of slaves, heroes, and gods appear to have been employed occasionally for this purpose. The principal specimen of this kind of architecture which remains is in a portico called Pandroseum, attached to the temple of Erectheus at Athens, in which statues of Carian females, called Caryatides, are substituted for columns.

Roman Architecture.—Roman architecture possessed no originality of any value; it was founded on copies of the Greek models, and these were modified to suit circumstances and tastes. The number of orders was augmented by the addition of the Tuscan and Composite.

Tuscan Order.—This order is not unlike the Doric, and is chaste and elegant. The shaft had a simple base, ornamented with one torus, and an astragal below the capital. The proportions were seven diameters in height. Its entablature, somewhat like the Ionic, consisted of plain running surfaces.

The Composite Order.—Of this there were various kinds, differing less or more either in the ornaments of the column or in the entablature. The simplest of this hybrid order was that which combines parts and proportions of the Doric, the Ionic, and the Tuscan.

The temples of the Romans sometimes resembled those of the Greeks, but often differed from them. The Pantheon, which is the most perfectly preserved temple of the Augustan age, is a circular building, lighted only from an aperture in the dome, and having a Corinthian portico in front. The amphitheater differed from the theater, in being a completely circular or rather elliptical building, filled on all sides with ascending seats for spectators, and leaving only the central space, called the arena, for the combatants and public shows. The Coliseum is a stupendous structure of this kind. The aqueducts were stone canals, supported on massive arcades, and conveying large streams of water for the supply of cities. The triumphal arches were commonly solid oblong structures ornamented with sculptures, and open with lofty arches for pas-

sengers below. The edifice of this kind most entire in the present day is the triumphal arch of Constantine, at Rome.

The basilica of the Romans was a hall of justice, used also as an exchange or place of meeting for merchants. It was lined on the inside with colonnades of two stories, or with two tiers of columns, one over the other. The earliest Christian churches at Rome were sometimes called basilicæ, from their possessing an internal colonnade. The monumental pillars were towers in the shape of a column on a pedestal, bearing a statue on the summit, which was approached by a spiral staircase within. Sometimes, however, the column was solid. The thermæ, or baths, were vast structures, in which multitudes of people could bathe at once. They were supplied with warm and cold water and fitted up with numerous rooms for purposes of exercise and recreation.

Italian Architecture.—After the dismemberment of the Roman empire, the arts degenerated so far that a custom became prevalent of erecting new buildings with the fragments of old ones, which were dilapidated and torn down for the purpose. This gave rise to an irregular style of building, which continued to be imitated, especially in Italy, during the dark ages. It consisted of Grecian and Roman details, combined under new forms, and piled up into structures wholly unlike the unique originals. Hence the names Græco-Gothic and Romanesque architecture have been given to it. After this came the Italian style, which was professedly a revival of the classic styles of Greece and Rome, but adapted to new manners and wants—a kind of transition from ancient to modern times. Its great master was Andrea Palladio, a Venetian (born 1518, died 1580).

There are considerable variety and beauty in the foliate and other enrichments of an architectural character in many structures in Italy, but very little ornament enters into the columnar composition of Italian architecture. Friezes, instead of being sculptured, are swollen; the shafts of columns are very seldom fluted, and their capitals are generally poor in the extreme; moldings are indeed sometimes carved, but not often; rustic masonry, ill-formed festoons, and gouty balustrades for the most part supply the place of chaste and classic ornaments.

The Chinese Style.—The ancient Tartars and wandering shepherds of Asia appear to have lived from time immemorial in tents, a kind of habitation adapted to their erratic life. The Chinese have made the tent the elementary feature of their architecture; and of their style anyone may form an idea by in-

specting the figures which are depicted upon common china ware. Chinese roofs are concave on the upper side, as if made of canvas instead of wood. A Chinese portico is not unlike the awnings spread over shop windows in summer time. The veranda, sometimes copied in dwelling houses, is a structure of this sort. The Chinese towers and pagodas have concave roofs, like awnings, projecting over their several stories. Such structures are built with wood or brick; stone is seldom employed.

The Saracenic, Moorish, and Byzantine Styles.—The Arabs, or Saracens, as they are more usually called, and the Moors, introduced into Spain certain forms of architecture which differed considerably from the Grecian in appearance, though founded on its remains in Asia and Africa.

The chief peculiarity of this architecture was the form of the arch; the Saracens are understood to have made it of greater depth than width, thus constituting more than half a circle or ellipse, and therefore unphilosophical and comparatively insecure; while the Moorish style was principally distinguished by arches in the form of a horseshoe or a crescent.

We associate with these styles another, which arose at Constantinople, called the Byzantine, likewise formed on the remains of Grecian art, and partaking of a slightly Eastern character. It became known in Western Europe along with the Lombard, another degenerate Grecian style, about the ninth and tenth centuries.

Saxon Style.—This style commenced at the establishment of Christianity among the Saxons in the sixth century, and is called Saxon from its having prevailed during the reigns of the Saxon and Norman kings in England.

Gothic or Pointed Style.—The term Gothic is a modern error, which, being now impossible to correct, is suffered to remain as the generally distinguishing appellation of the kind of architecture possessing pointed arches. This style originated in Germany about the middle of the thirteenth century, and was zealously pursued as the leading fashion for ecclesiastical structures all over Europe. Executed by a class of skilled artisans, who wandered from country to country, the finest specimens of the pointed style are the cathedrals of Strasburg, Cologne, and Antwerp, and the splendid abbeys of Melrose and Westminster.

In this fanciful and picturesque style of architecture, the slender columns, always united in groups, rise to a lofty height, resembling the giants of the grove, in whose

dark shade the ancient Teuton used to build his altar. In the obscure depth of the dome, the mind is awakened to solemn devotional feelings.

When the circular arch totally disappeared in 1220, the early English style commenced. The windows of this style were at first very narrow in comparison with their height; they were called lancet shaped, and were considered very elegant; two or three were frequently seen together, connected by dripstones. In a short time, however, the windows became wider, and divisions and ornaments were introduced. Sometimes the same window was divided into several lights, and frequently finished at the top by a light in the form of a lozenge, circle, trefoil, or other ornament.

About the year 1300, the architecture became more ornamental, and from this circumstance received the name of the decorated English style, which is considered the most beautiful for ecclesiastical buildings.

The transition from the decorated to the florid, or perpendicular, style was very gradual. Ornament after ornament was added, till simplicity disappeared beneath the extravagant additions; and about the year 1380 the architecture became so overloaded and profuse that it obtained the title of florid, which by some persons is called the perpendicular, because the lines of division run in upright or perpendicular lines from top to bottom, which is not the case in any other style.

Norman, Tudor, and Modern Gothic.

—Throughout England may be seen many aged castles, some still in a state of good preservation, but the greater number in ruins, and occupying, with their picturesque remains, the summit of a rising ground or rocky precipice. These castles are of a style which prevailed during the feudal ages in Europe, and was brought to England by the Normans, who erected them as fastnesses, into which they might retire and oppress the country at pleasure.

The feudal castles in England, like those on the Rhine, consisted for the most part of a single strong tower, or keep, the walls of which were from six to ten feet thick, and the windows only holes of one or two feet square, placed at irregular intervals. The several floors were built on arches, and the roof was flat or battlemented, with notches in the parapet, from which the inhabitants or retainers of the chieftain might defend themselves with instruments of war. The accommodations for living were generally mean, and what would now be called uncomfortable. Around or in front of the main tower there was usually a courtyard, protected by a high wall, and the

arched entrance was carefully secured by a falling gate or portcullis. Outside, there was in many cases a regular wet ditch or fosse. Castles of greater magnitude consisted of two or more towers and inner buildings, including a chapel and offices for domestics, and stables for horses and other animals. Some of them were on a great scale, and possessed considerable grandeur of design.

As society advanced and civil tranquillity was established, these military strengths gradually assumed a character of greater elegance and less the appearance of defense. The wet ditch disappeared, and was superseded by a lawn or shrubbery. Instead of the drawbridge and portcullis, there was a regular approach and gate of ordinary construction. The windows became larger, and were fitted with glass frames, and stone was abandoned for the greater comfort of wooden floors. Instead, also, of a bare region around, in which no foe might lurk, gardens were established, and a long avenue of trees led to the front of the modernized mansion. In some instances the pepper-box turrets at the upper corners of the building remained. Of the class of structures that sprang up in this period of transition, which we may refer in England to the fifteenth and sixteenth and in Scotland to the seventeenth centuries, there are several highly interesting remains. These edifices of the nobility and gentry were no longer called castles; they took the name of halls, and as such had attained so great a pitch of magnificence in the reigns of Henry VIII. and Elizabeth, as to have subsequently given a name to a new style — the Tudor or Elizabethan. Latterly, and with no very distinct reference to any particular period, this remarkable fashion of building has been pretty generally called the old English style of architecture. One of the best existing specimens of the Tudor era of architecture is Haddon Hall, in Derbyshire, the property of the Duke of Rutland.

Modern British Architecture.— During the sixteenth century, an extraordinary effort was made in Italy to restore the purity of Grecian architecture; and in this attempt Palladio was followed by the not less eminent Michael Angelo Buonarroti, who, at an advanced age, in 1546, undertook the continuation of the building of St. Peter's at Rome, a work on which the greatest splendors of the Italian style are lavished. Into England, this revived taste for the Grecian was introduced at the beginning of the seventeenth century by Inigo Jones, to whose contemptuous observations on the German or pointed style the term Gothic has been traced; and after his decease, the Grecian, or more properly the Italianized

Grecian, was perpetuated on a scale still more extensive by Sir Christopher Wren. The edifices erected by this great master are characterized by the finest taste, and his spires in particular are models of elegance. The greatest work of Wren was St. Paul's Cathedral in London, in which the Italian is seen in all its glory.

The eighteenth century was an era of decline in architectural taste. Every other style merged in that of a spiritless and often mean Græco-Italian, out of which the architects of the nineteenth century have apparently had a difficulty to emerge. Latterly, there has been a revival in England of a purer kind of Grecian, and also, as we have already said, of old English, and the Gothic or pointed style, and in most instances with good effect. It is only to be lamented that, by the manner in which state patronage is distributed in this branch of the fine arts, some of the largest and most expensive structures—Buckingham Palace and the National Gallery, for example—have been erected on the poorest conceptions of the Grecian style, and with a general effect far from pleasing. In Paris there now exist some modern structures after correct Grecian models, which cannot be too highly praised; we would, in particular, instance the building called the Madeleine, the Bourse, and the interior of the church of St. Genevieve, which are exceedingly worthy of being visited by young and aspiring architects from Britain. Of the superb buildings springing up on all sides of this vast continent, it is unnecessary to speak. While those already in existence, notably in Washington, are admirable copies of the great Greek and Roman periods, the so-called Queen Anne is now the especial craze.

For palatial and other secular edifices in England, the Renaissance for the most part was in favor in the earlier part of this century. The attempt of Stuart and others in favor of Greek art had but little influence upon architecture, while the effort of Scott and others, especially Ruskin, to bias the public mind in the direction of the Gothic has succeeded far beyond all efforts of the same kind in other countries. In churches and educational institutions, it found especial favor, and, in 1836, it was decided that the legislative halls of the Empire should be rebuilt in this style, according to the plans of Sir Charles Barry. These contemplated a Gothic, rich but not ornate, with square supporting towers at certain points, flanked, like the walls, with massive buttresses. The New Palace of Westminster, as it is called, covers eight acres and contains upwards of five hundred apartments clustered around eleven open quadrangles or courts. The edifice is of

gray limestone, and is not only one of the noblest structures of this century, but a most successful attempt to secularize this truly northern style of architecture.

Architecture in the United States.

— During the Colonial period of the United States there was neither time nor opportunity for the practice of the fine arts. When the Revolution was over, however, Congress in spite of heavy debt proceeded to lay out a National Capital and erect national buildings. These latter were the first to receive serious architectural treatment, and until recently were, together with the state capitols, in what may be called a classic style, because they had porticoes with columns and other features of the ancient orders.

The Capitol at Washington, the inception of which belongs to the last century, is unquestionably the grandest pile in that city, and probably the most monumental of United States buildings. Notwithstanding its conventionally classic style it is an edifice of which a great nation may be proud, majestic both within and without, and gaining in effect from its position on a commanding site. The corner stone of the Capitol was laid in 1793. It is of the Renaissance, and consists of two stories rising from a lofty rustic basement. The ground plan is a central pavilion with north and south wings. The principal façade is on the east side, where a portico of Corinthian columns thirty feet in height fronts the pavilion, while pilasters of the same order are continued along the wings. The eight middle columns project so as to admit of another inner row, and these sixteen columns support a noble pediment adorned with a bas-relief. The subject is allegorical, Liberty attended by Hope and Justice, and is said to have been designed by John Quincy Adams. The approach to this imposing portico is by a flight of broad marble steps. The central portion of the edifice is, for the most part, occupied by a circular apartment, measuring about one hundred feet in diameter and height, and known as the Rotunda. It is ornamented with paintings and bas-reliefs illustrative of our national history. The paintings are separated from one another by gilded pilasters, which rise to the dome forming the roof. The dome compares well with those that are famous in the world, and, taken as a whole, the Capitol is more stately than the Houses of Parliament, and is open to as little criticism as the buildings of its class in other lands.

Treasury and Patent Office.— Among the older government buildings may be cited the United States Treasury, a structure with four fronts. The building commonly known as the

Patent Office, which has recently been subjected to considerable alteration, is also a four fronted building with a portico in the center of each of its sides, the principal consisting of two rows of eight columns. As Grecian structures these monumental piles are not unworthy, but the incongruity between their appearance and their purpose is manifest.

Pension Bureau.— The newer government structures at Washington have followed neither the Grecian nor the vernacular Palladian. The Pension Bureau is a large and severely symmetrical structure in the style of Bramante, having three stories of rectangular windows, a bold cornice and an attic in the center. The decorations are of terra cotta.

The Congressional Library is of the Italian Renaissance order of architecture; it has three stories with a dome; and is in area 470 by 340 feet, covering nearly three and one half acres of ground, with four inner courts. The building is surmounted on all sides by a carved balustrade. The dome is finished in black copper with panels gilded with a thick coating of gold leaf. The cresting of the dome above the lantern terminates in a gilded finial representing the torch of Science ever burning. The general plan of the structure consists of a great central rotunda, from which radiate book stacks and which is inclosed in a parallelogram of galleries and pavilions. The building material employed for the exterior walls is white granite from New Hampshire, and for the inner courts Maryland granite and white enameled bricks. The interior is rich in choice marbles from Europe, Africa, and America. The entrance to the building is by massive stairways of the central pavilion, and through bronze doors to the central stair hall. This magnificent apartment is pronounced to be unsurpassed by any other entrance hall in the world. It is lined throughout with fine Italian marble highly polished. On the sides rise lofty rounded columns, with elaborate carved capitals of Corinthian design; while the arches are adorned with marble rosettes, palm leaves, and foliated designs of exquisite finish and delicacy. The newel posts of the stairway are enriched by beautiful festoons of leaves and flowers, and are surmounted by two bronze lamp bearers. The staircases are ornamented with miniature marble figures by Martiny, carved in relief, representing in emblematic sculpture the various arts and sciences. This beautiful and spacious entrance hall has been described as a "vision in polished stone," and taken in connection with the grand corridors and rich decorations may be pronounced the finest marble interior in America.

The Bureau of Printing and Engraving is in

red and brown brick, round arched, and without the orders, and may, perhaps, be called Romanesque. Other specimens of Washington architecture worthy of mention are the new Corcoran Art Gallery, the Smithsonian Institution, and the War, State, and Navy building.

Besides the buildings of the Greek style erected in Washington, others, not only by the government but by banking corporations, commercial houses, etc., have been erected in various parts of the country. The two best of these are probably the Sub-Treasury building at New York and Girard College at Philadelphia. Both are of white marble, and the latter modeled, as to the exterior, after the Parthenon,—that is so far as possible, while employing a different order of architecture. It is considered the Greek building par excellence of America, as the Madeleine is of France, and is a Corinthian peristyle resting upon a Grecian stylobate. Its monolithic colonnade is quite imposing, but as a whole it fails to excite in the beholder much of that emotion which is awakened by the Grecian edifice. Cold and unimpressive, it seems rather like some rare exotic—a thing to be gazed and wondered at rather than enjoyed. This is no doubt attributable in part to its position, for while the Greek temple always crowned some lofty height, or some jutting spur, this edifice is built in the middle of a broad, flat plain, without any relief from the blue sky or jagged mountain side.

Several of the state capitols illustrate pleasing styles of architecture. The state house at Newport is a perfectly symmetrical brick and stone structure, commenced in 1738. It has rectangular windows with quoins, a balcony over the entrance, above the balcony a broken pediment, and over this a truncated gable. Over all rises a low octagonal turret. The old state house at Boston is of the same period; it is a very plain structure, with a wide entrance and curious end gables. Independence Hall and the White House belong to the same period.

The State Capitol at Albany, as originally designed, was an immense rectangular Renaissance block, in which an order was given to each story, much after the style practiced at Venice by Sansovino and San Micheli, and was crowned by a domical tower of grand proportions. The design was improved by Richardson, and the upper portions of the edifice were completed according to it. There is great beauty in the newer portion, but it cannot be said that there is congruity. The towers are Romanesque, while the cornice of the order below is changed to Gothic. Parts of the interior, as the Hall of Assembly, the work of Eidlitz, are

Gothic of the most beautiful kind—vaulted mediæval halls enshrined in a classical exterior.

The Capitol at Hartford, Connecticut, although it has a dome like many other capitols, is far from being an ordinary structure, and may be reckoned one of the finest public buildings in the United States. The style is Gothic, and the regular façade is broken into a center, curtains, and wings. The center has two low towers in every way subordinate to the tall tambour and dome which rise behind them. This cupola crown tower is decidedly Gothic in the sentiment of its details.

The City Hall, Philadelphia, is among the largest of modern buildings, slightly exceeding the Capitol at Washington in area. Seldom has a better opportunity been afforded for architectonic display than is given by its position at the junction of two of the principal streets of the city. It occupies what was once Penn Square and thus stands free all around. This immense structure is conceived in the style of the Louvre at Paris with central and angle pavilions, the whole surmounted by a mansard roof of great height. Each front is a symmetrical whole, and, with the exception of the slight difference in length, the fronts are alike. The central feature is a gigantic tower which rises upward of 537 feet above the pavement. This tower was designed to be the loftiest in the world, but in this respect has already been surpassed by the Washington Monument at the National Capital. The magnificence of this edifice consists in its imposing dimensions, the rich array of marble and polished granite, and the beautiful sculpture which adorns its façades and entrance halls.

In our largest cities we find many church edifices both completed and in process of erection which are worthy of attention for their architecture as well as the solidity and beauty of material employed. Most of these are of the Gothic style.

Trinity Church in New York, completed in 1846, was the first stone edifice after the Gothic, in America. It is most nearly allied to the early English, and the architect deserves the gratitude of all lovers of the beautiful, for giving his countrymen so elegant and chaste a model.

Grace Church in the same city, built of granite, is of a more ornate style and presents nearly all the peculiar features of the Gothic, although in small dimensions.

St. Patrick's Cathedral, fronting on Central Park, affords us the best specimen of the Gothic as it prevailed in Europe in the fourteenth century. The style is commonly known as the Decorated or Geometric Gothic. *Trinity Church*,

Boston, a Romanesque or Byzantine structure, is the work of Richardson. The original design was improved in 1886, and, as now completed, furnishes perhaps the noblest church edifice in the United States.

The Cathedral of St. John the Divine, New York, which gives promise of great architectural beauty, is in the modified Romanesque style of architecture.

The Temple Emmanuel in New York city has a most ornate and symmetrical exterior, with two towers and an arcade in the center, and although the effect is pretty and fanciful rather than grand, it ranks among the finest of the religious edifices of that city. The Rodef Shalom synagogue, Philadelphia, has an effective façade, and is Gothic in sentiment notwithstanding its Moorish forms. The Synagogue Emmanuel in San Francisco is peculiar among synagogues from the fact that the windows are filled with Gothic tracery and its walls and towers set with Gothicized buttresses.

Memorial Hall of Harvard University is built of brick banded in the Lombard style with buff tiles bearing geometric designs in blue. The central tower rises above the Memorial Hall while smaller towers, all of the English Gothic, flank its walls.

The Art Museum at Cincinnati, in the Romanesque style, has two ranges of rectangular twin windows, and the plain walls of the uppermost story are unrelieved save by blind arches. The central hall is the most striking feature of the interior. The walls are of local blue limestone, with cornices and arches of Missouri granite; the roof is of red Akron pantiles. The eastern wing has a fine polygonal apse with nine pairs of windows and a tall tower on the line of the entrance front.

The Museum of Fine Arts at Boston, commenced in 1871, is one of the first buildings in the United States upon which terra cotta—made in England from the architect's drawing—has been extensively used. This structure may be called Italian Gothic; upon the ground floor it has arched openings in groups separated by buttresses, while above these large panels, some of them filled with sculptures, mask the picture gallery. The entrance is through a pair of arches.

The Masonic Temple of Philadelphia is a very imposing and massive building. It dominated Penn Square until the City Hall arose beside it. It is built of gray granite, and the exterior is round arched and may be called Romanesque, but does not strictly conform to the Norman phase of that style.

Harvard College, time honored in this country, though it would be young in the old

world, marks in its various structures all the phases through which American architecture has passed. Its finest buildings are undoubtedly its most modern ones. These are the Memorial Hall, the Gymnasium, the Law School and Seaver Hall, the last three of which are the work of Richardson.

The University of Pennsylvania comprises a group of Gothic structures built of green serpentine, with dressings of Ohio stone. There is little ornament, but the grouping is effective and the general effect satisfactory. Recent buildings have been added of a very pleasing style and admirably express their purpose.

Stone Hall, Wellesley College, is a fine structure and what may be called Free Classic, but in its stepped gables and in the lines of its central pavilion approaches Flemish Renaissance. The entrance is well accentuated, contrasting admirably with the curtain-walls which intervene between it and the tower-like blocks which mark the intersection of the center with its wings.

The Art School at Yale is a species of Gothic, but is of heavy outline, and its tower is without sufficient prominence. Most of the newer Yale buildings are in this style, including the Peabody Museum, which is perhaps the best.

Princeton has a good Gothic dormitory, and the Lecture Hall of the theological seminary, with its groups of cusped windows, is effective. The buildings of the Chicago University and Leland Stanford, Jr., University exhibit unique and pleasing styles.

Some of the best specimens of architecture in America, in addition to those already noticed, are the City Hall of San Francisco, Allegheny Court House of Pittsburg, the Boston Public Library, Ridgway Library of Philadelphia, the Libraries at Burlington, Vt., and Woburn, Massachusetts, the Metropolitan Opera House, New York city, the Casino of the same city, Memorial Hall in Fairmount Park, Ponce de Leon Hotel at St. Augustine, Auditorium Theater, Chicago, the Century and Metropolitan Clubs, New York, the Carnegie Library at Pittsburg, the Pennsylvania Railroad Station at Philadelphia, South Terminal Station, Boston, and the National Academy of Design, New York city; though many more might be mentioned of varying degrees of merit.

Alexandrian Codex is an important manuscript of the Sacred Scriptures written in Greek. It is written on parchment, in finely-formed uncial letters, and is without accents, marks of aspiration, or spaces between the words. Its probable date is the latter half of the sixth century. With the exception of a few gaps, it contains the whole Bible in Greek, along with the Epistles of Clemens

Romanus. This celebrated manuscript, which is now in the British Museum, belonged, as early as 1098, to the library of the Patriarch of Alexandria. In 1628 it was sent as a present to Charles I. of England, by Cyrillus Lucaris, Patriarch of Constantinople, who declared that he got it from Egypt; and that it was written there appears from internal and external evidence.

Alexandrian Library contained in the time of Cleopatra about 700,000 volumes or rolls, and was founded at the suggestion of Demetrius Phalereus, a fugitive from Athens in the reign of Ptolemy Soter. The greater portion of this remarkable collection was destroyed during the Alexandrine war. This loss, however, was repaired by Mark Antony, who presented to Cleopatra the library taken at the siege of Pergamos. From this time until about the year 391 A. D., the library increased in size and reputation, and contained treasures of learning in all known tongues. At the burning of the Temple of Jupiter Serapis by the Christians under Theodosius the Great, about that year a portion of the library was destroyed, and when the Arabs, under Caliph Omar, took the city in 640 A. D., the destruction of the remainder was completed.

Egyptian Labyrinth was situated at Crocodilopolis, near Lake Mœris, in the vicinity of the present pyramid of Biakhmu. It was built of polished stone, with many chambers and passages, said to be vaulted, having a peristyle court with 3,000 chambers, half of which were under the earth and the others above ground, which formed another story. The upper chambers were decorated with reliefs; the lower were plain, and contained, according to tradition, the bodies of the twelve founders of the building and the mummies of the sacred crocodiles, conferring on the building the character of a mausoleum, probably conjoined with a temple—that of Sebak, the crocodile god. The Labyrinth stood in the midst of a great square. Part was constructed of Parian marble and of Syenitic granite; it had a staircase of ninety steps, and columns of porphyry, and the opening of the doors echoed like the reverberation of thunder. There is great difference of opinion among authors as to the name of the king under whom this remarkable work was constructed and the purpose for which it was intended, and it is probable that it was not built in a single reign. According to some ancient authorities it was supposed to have been inhabited by the Dodicarchy, or twelve kings, who conjointly ruled Egypt before Psammetichus I.; while others claim it to have been the place of assembly of the governors of nomes, or districts—twelve

in number, according to Herodotus; sixteen, according to Pliny; and twenty-seven, according to Strabo. The Labyrinth was extant in the time of Pliny, A. D. 78, and was then, according to that author, 3,600 years old. The ruins of the foundations or lower chambers have been found at the modern village of Howara, in Fayoom. The next labyrinth in renown to the Egyptian was the Labyrinth of Crete, supposed to have been built by Dædalus for the Cretan monarch, Minos, in which the Minotaur was confined by his orders. The third of the labyrinths of antiquity was the Samian, constructed by Theodorus and artists of his school, in the age of Polycrates, 540 B. C., supposed to be a work of nature embellished by art, having 150 columns erected by a clever mechanical contrivance. Other inferior labyrinths existed at Nauplia, at Sipontum in Italy, at Val d'Isipica in Sicily, and elsewhere.

Councils of Nice.—The first Council of Nice was held in the Emperor Constantine's palace, June 19, A. D. 325, and was attended by 318 bishops of the Catholic Church, and resulted in the adoption of the Nicene Creed, expounding the faith of the Church. August 17, A. D., 786, the second Council of Nice was convened by order of the Empress Irene and her son Constantine, at which there were 376 bishops present. This council was held for the purpose of establishing the use of images in the churches, which had been interdicted by the Emperor Leo and his son Constantine, but was dissolved owing to the tumults raised by the party in opposition. It was reconvened September 24, A. D. 787, when the use of images was restored.

Islam, or, as it is called, Eslam, is the proper name of the Mohammedan religion. The word is Arabic, and means "Submission to God," or, according to some authorities, "Salvation." Islam, it is held, was once the religion of all men; and every child, it is believed, is born in Islam, or the true faith, and would continue in it till the end were it not for the wickedness of its parents, "who misguide it early and lead it astray to Magism, Judaism, or Christianity." Whether wickedness and idolatry came into the world after the murder of Abel, or at the time of Noah, or only after Amru Ibn Lohai, one of the first and greatest idolaters of Arabia, are moot-points among Moslem theologians.

Albigenses.—About the beginning of the thirteenth century various sects of heretics abounded in the south of France, and to these was applied the name Albigenses. The name arose from the circumstance that the district of Albigeois in Languedoc—now in the de-

partment of Tarn, of which Albi is the capital—was the first point against which the crusade of Pope Innocent III., 1209, was directed. The immediate pretense of the crusade was the murder of the papal legate and inquisitor, Peter of Castelnau, who had been commissioned to extirpate heresy in the dominions of Count Raymond VI. of Toulouse; but its real object was to deprive the count of his lands, as he had become an object of hatred from his toleration of the heretics. It was in vain that he had submitted to the most humiliating penance and flagellation from the hands of the legate, Milo, and had purchased the papal absolution by great sacrifices. The expedition took by storm Beziers, the capital of Raymond's nephew Roger, and massacred 20,000 of the inhabitants, Catholics as well as heretics. Simon, Count of Montfort, who conducted the crusade under the legates, proceeded in the same relentless way with other places in the territories of Raymond and his allies. The conquered lands were given to Simon de Montfort, and by him were eventually ceded to Louis VIII. Raymond VI. and Raymond VII. disputed the possession of the land by the king, and after thousands had perished on both sides, a peace was concluded in 1229, at which Raymond VII. purchased relief from the ban of the church by immense sums of money, gave up Narbonne and several lordships to Louis IX., and had to make his son-in-law, the brother of Louis, heir of his other possessions. The heretics were handed over to the proselyting zeal of the Order of Dominicans and the bloody tribunals of the Inquisition, and both used their utmost power to bring the recussant Albigenes to the stake. From the middle of the thirteenth century the name of the Albigenes gradually disappears.

Juggernaut.—The temple in the town of Juggernaut, one of the chief places of pilgrimage in India, contains an idol of the Hindoo god, called *Jaggernaut* or *Juggernaut*, a corruption of the Sanskrit word *Jagannatha*, i. e., lord of the world. The legend regarding the building of the town, the erection of the temple, and the formation of the idol is as follows: A king, desirous of founding a city, sent a learned Brahmin to pitch upon a proper spot. The Brahmin, after a long search, arrived upon the banks of the sea, and there saw a crow diving into the water, and, having washed its body, making obeisance to the sea. Understanding the language of birds, he learned from the crow that if he remained there a short time he would comprehend the wonders of this land. The king, apprised of this occurrence, built on the spot where the crow had appeared a large city and a place of worship. The Rajah one night

heard in a dream a voice saying: "On a certain day cast thine eyes on the seashore, when there will arise out of the water a piece of wood 52 inches long and $1\frac{1}{2}$ cubits broad; this is the true form of the Deity; take it up and keep it hidden in thine house seven days; and in whatever shape it shall then appear, place it in the temple and worship it." It happened just as the Rajah had dreamed, and the image, called by him *Jagannatha*, became the object of worship of all ranks of people, and performed many miracles. The car-festival, when *Jagannatha* is dragged in his car on a yearly visit to his country quarters, is currently believed to be the occasion of numerous cases of self-immolation, the frantic devotees committing suicide by throwing themselves before the wheels of the heavy car. This has been proved, however, upon good authority, to be untrue.

Children's Crusade.—In the summer of 1212 two immense armies of children were gathered at Cologne, in Germany, and at Vendome, in France, summoned thither by two boy prophets, Stephen of Cloys (France) and Nicholas of Cologne (Germany), both about twelve years of age. These boy prophets believed or pretended to believe, that they were inspired by heaven, and the crusade which they preached was not a crusade of blood against the Saracens, but a crusade of prayer. The children were to march to the sea, which would open, as it once did for the Israelites, to permit them to pass over into Palestine dry shod. There they were to convert the leaders of Islam and baptize the heathen. The excitement aroused by this preaching spread so among the children that within short intervals of each other two unarmed hosts of German children, drawn from all classes, and nearly all under twelve years of age, left Cologne to march over the sea to 'the Holy Land. The first was led by the famous Nicholas, and the second by a boy whose name is not known. Their combined numbers are believed to have been 40,000. At about the same time an army of French children to the number of about 30,000 left Vendome under Stephen. The mortality among the German children in their passage across the Alps was frightful. Nearly 30,000 succumbed to exposure, fatigue, and hunger. Of the French army, 10,000 died before it reached Marseilles. The army under Nicholas was broken up at Genoa when it was found that the sea did not open to let them pass, and some of the children were returned to their homes by the humane Genoese; but others pressed on to Pisa and obtained passage by ship to the Holy Land. A part of the children under the unknown leader were

shipped to Palestine from Brindisi, and about 5,000 of the French children were shipped from Marseilles, and all who survived the voyages were sold as slaves to the Turks. Of the 70,000 children who joined this crusade, it is probable that less than 20,000 were ever heard of afterward by their parents.

Latter-day Saints, commonly called "Mormons," constitute a religious sect officially styled "The Church of Jesus Christ of Latter-day Saints." The church was organized at Fayette, N. Y., April 6, 1830, through the instrumentality of Joseph Smith, the son of a Vermont farmer. Joseph Smith announced that in 1820, when he was fifteen years old, he received in answer to prayer a visitation of heavenly personages; and that in 1827 an angel delivered to him an ancient record engraved on plates of gold. This record Joseph Smith translated by Divine aid, and the modern version appeared in print in 1830 as the Book of Mormon. The book purports to be a history of the ancient inhabitants of the western continent; and it is regarded by the Latter-day Saints as a volume of sacred writ of equal authority with the Jewish and Christian Scriptures, but not superseding or supplanting them. Persecution assailed the youthful prophet and the church from the first. In 1831 the people established themselves at Kirtland, Ohio, where they erected a temple which is still standing. Branches of the church had already been organized in many of the states, when in 1838, owing to continued and increasing persecution, a general westerly migration was inaugurated. Most of the people located in Illinois, where in 1839 they began the erection of a town, first called Commerce but later known as Nauvoo. Here, with untiring zeal they built another temple, costlier and more imposing than the first. Persecution followed the church and culminated in the assassination of Joseph and his brother Hyrum, the latter being patriarch of the church. This tragedy occurred June 7, 1844, as the result of a mobocratic attack on the jail at Carthage, Ill., where the two were confined awaiting trial on some minor charge. Brigham Young then became the head of the church, and in 1846 the exodus from Nauvoo began. The people fled westward and settled in the valley of the Great Salt Lake, then a part of the Mexican domain. The pioneers of the colonizing hosts entered the valley July 24, 1847. With marvelous energy, amid unmeasured hardships and sacrifices, these zealous religionists transformed the desert into a garden of beauty, and every year witnessed the uninterrupted growth of the church. The common-

wealth thus founded in the heart of the American Desert has scarcely suffered a temporary check in its progress and growth to the present time. The practice of plural marriage led to much persecution. This practice was never general and has now been formally discontinued. It has been confused in the minds of many with "Celestial marriage," which differs from the ordinary marriage ceremony only in being a covenant between husband and wife for "time and all eternity" instead of a contract for this mortal probation alone. A summary of the doctrinal features of "Mormonism," as given over the signature of the founder, and as still professed by the church, is as follows:—

ARTICLES OF FAITH.

Of the Church of Jesus Christ of Latter-day Saints.

1. We believe in God, the Eternal Father, and in His Son, Jesus Christ, and in the Holy Ghost.
2. We believe that men will be punished for their own sins, and not for Adam's transgression.
3. We believe that through the atonement of Christ, all mankind may be saved, by obedience to the laws and ordinances of the Gospel.
4. We believe that the first principles and ordinances of the Gospel are: First, faith in the Lord Jesus Christ; second, repentance; third, baptism by immersion for the remission of sins; fourth, laying on of hands for the gift of the Holy Ghost.
5. We believe that a man must be called of God, by "prophecy, and by the laying on of hands," by those who are in authority, to preach the gospel and administer in the ordinances thereof.
6. We believe in the same organization that existed in the primitive church, namely, Apostles, Prophets, Pastors, Teachers, Evangelists, etc.
7. We believe in the gift of tongues, prophecy, revelation, visions, healing, interpretation of tongues, etc.
8. We believe the Bible to be the word of God, as far as it is translated correctly; we also believe the Book of Mormon to be the word of God.
9. We believe all that God has revealed, all that He does now reveal, and we believe that He will yet reveal many great and important things pertaining to the kingdom of God.
10. We believe in the literal gathering of Israel and in the restoration of the ten tribes. That Zion will be built upon this continent. That Christ will reign personally upon the earth, and that the earth will be renewed and receive its paradisaical glory.
11. We claim the privilege of worshipping Almighty God according to the dictates of our conscience, and allow all men the same privilege, let them worship how, where, or what they may.
12. We believe in being subject to kings, presidents, rulers, and magistrates, in obeying, honoring, and sustaining the law.
13. We believe in being honest, true, chaste, benevolent, virtuous, and in doing good to ALL MEN; indeed we may say that we follow the admonition of Paul, "We believe all things, we hope all things," we have endured many things, and hope to be able to endure all things. If there is anything virtuous, lovely, or of good report or praiseworthy, we seek after these things.—Joseph Smith.

Ark of the Covenant.—Previous to the destruction of the Temple of Solomon by the Babylonians the Ark of the Covenant was contained therein, but what became of it after that time is unknown. It is believed by some to have been taken away or destroyed by

Nebuchadnezzar, while certain of the Jews believe that it was concealed from the spoilers, and account it among the hidden things which will be revealed by the Messiah. That the old Ark was not contained in the second Temple all Jewish writers agree; and the absence of the Ark is one of the important particulars in which this Temple was held to be inferior to that of Solomon. It is held by some writers, however, that the Jews could not properly carry on their worship without an Ark, hence that a new one must have been made and placed in the Temple if the original Ark was not recovered. The silence of Ezra, Nehemiah, the Maccabees, and Josephus, who repeatedly mention all the other sacred utensils but never name the Ark, would, nevertheless, seem conclusive on this subject.

Mount Ararat.—The mountains of Ararat, referred to in the Scriptures, overlook the plain of Araxes in Armenia, and are divided into two peaks, Great Ararat and Little Ararat. The summit of the former is 17,323 feet above the level of the sea, and of the latter 13,000 feet. It is believed that the resting place of the Ark was upon some lower portion of this range rather than upon the peaks, and in support of this view is the fact that at an elevation of 8,000 or 7,000 feet the climate is temperate, the harvests are quick to mature and abundant; while the peaks, for more than 3,000 feet below their summits, are continuously covered with ice and snow.

Obelisks.—The word is from the Greek, and signifies a prismatic monument of stone or other material terminating in a pyramidal or pointed top. They are found principally in Egypt, and date back to the most remote periods of antiquity. They were placed before the gateways of the principal temples, and correspond in Egyptian art to the columns of the Romans and stelæ of the Greeks, and appear to have been erected to record the honors or triumphs of the monarchs. They are also called "monoliths," being cut out of a single piece of stone, and have four faces, broader at the base than at the top, the width at the base being one tenth the height of the shaft to the beginning of the pyramidion, or cap, which is also one tenth of the same height. The sides are generally sculptured with one vertical line of deeply cut hieroglyphs and representations. Some of them were originally capped with bronze or gold. Their height varied from a few inches to upward of one hundred feet, the tallest known being that of Karnak, which rises to 105 feet 7 inches. A number of them were removed to Rome by Augustus and later emperors, and they were afterwards transported to various cities of Italy and France

and used to adorn squares and public parks. Among the most notable of these relics of ancient art are the two known as Cleopatra's Needles, which, from the inscriptions on them, appear to have been set up at the entrance of the Temple of the Sun, in Heliopolis, Egypt, by Thothmes III., about 1831 B. C. Two centuries after their erection the stones were nearly covered with carvings, setting out the greatness and achievements of Rameses II. Twenty-three years before the Christian era they were moved from Heliopolis to Alexandria by Augustus Cæsar and set up in the Cæsarium, a palace which now stands, a mere mass of ruins, near the station of the railroad to Cairo. In 1819 the Egyptian Government presented one of them to England, but it was not taken to London until 1878. The other was transported to New York in 1880, it having been presented to the United States, and was raised on its pedestal in Central Park, New York, January 22, 1881. The material of these, and indeed of most of the obelisks, is granite brought from Syene, near the first cataract of the Nile. They were cut at the quarry, and floated into and down the Nile during one of the annual overflows.

Lake School.—Toward the close of the last century the poets Wordsworth, Coleridge, and Southey took up their residence in the Lake district of Cumberland and Westmoreland, in England, for the purpose, as they said, of seeking the sources of poetical inspiration in the simplicity of nature, rather than in the works of their predecessors and the fashions of the time. On this account they were given the name of the Lake School by the *Edinburgh Review*.

Kissing the Book.—The custom of swearing on the Bible comes from the ancient Jews, who at first touched their phylacteries—small cases containing strips of parchment inscribed with texts from the Old Testament—in taking oaths, and later laid their hands upon the Book of the Law; and the various customs of taking oaths in different countries have all a similar origin. The early Anglo-Saxons regarded stones as sacred to their gods, therefore laid their hands on a pillar of stone. In mediæval times it was customary to touch a relic, and this was regarded as giving the oath more sacredness than when sworn upon the missal, or prayer book. Another custom of the same times was swearing by churches. A certain number were mentioned, and the attester was obliged to go to each one, take the ring of the church door in his hand, and repeat his oath. The custom of kissing the cross to attest an oath has been observed in Russia from very early times, and has extended

into other countries. According to the laws of the Order of the Garter in the time of Henry VIII., Knights Templars were required in taking oath to touch the book and kiss the cross. Since the Reformation the taking of oaths by kissing the Bible has not been permitted in Scotland. In other portions of Great Britain it is the common method.

French Renaissance.—"Renaissance" is the name given to the style of art, especially architecture, in Europe which succeeded the Gothic and preceded the rigid copyism of the classic revival in the first half of the present century. It is also used to denote the time during which this style of art prevailed, and also to include the development of the European races in other lines as well as art. The name signifies the "new birth." The date of the beginning of this period coincides with that of the fall of the Byzantine Empire, and the latter was no doubt the cause of the former; for when the Turks took possession of Constantinople all the memorials, paintings, books, etc., that could be removed from the destroying hand of the invaders were hastily conveyed to Italy. These inspired just admiration among the Italian people, and aroused not only a desire to emulate the construction of such worthy works, but also an interest in ancient works and models. In 1494 Charles VIII., King of France, made a warlike expedition into Italy, and on his return brought some Italian workmen to supervise the construction of the royal buildings. This was the first introduction of the renaissance into France. Communication between France and Italy was also stimulated by this expedition, and the growth of Italian ideas among the French was steady, though slow. In the reign of Louis XII., 1498-1515, the work was further stimulated by the founding of a school of architecture under an artist from Verona. But it was under Francis I., 1515-'47, that the new growth was most stimulated and aided. This prince was possessed both of learning and intellectual power. He had a sincere love for literature, science, and art, and a keen appreciation of the beautiful in these departments. He invited a number of Italian artists to his court. Among the most famous of these were Leonardo da Vinci and Benvenuto Cellini. These and others introduced Italian details in their designs, which native architects applied to old forms, with which they were familiar; so that the French renaissance was similar to that of Italy, but different from it in many important respects. All lines of art felt the renaissance spirit; and not merely architecture, painting, and sculpture, but also music, poetry, and literature were stimulated. The minor

plastic and decorative arts, engraving, working in wood and metals, pottery, tapestry, etc., were cultivated with eagerness and skill. The study of the classics also received a new impulse, and this era had, in France, some of the greatest scholars of the times. Historical writers usually consider the renaissance period as one of the most important influences in hastening the growth of individuality and the work of the Reformation, and in ushering in the progress that has marked the modern history of the world. In Germany, Russia, and every country in Europe, the renaissance prevailed in a manner similar to that above described.

Lollards, or Lollhards, acquired their name from their practice of singing dirges at funerals—the Low German word *lullen*, or *lollen*, signifying to sing softly or slowly. The Lollards were a semi-monastic society formed in Antwerp about the year 1300, the members of which devoted themselves to the care of the sick and the dead. They were also called, from their frugal life and the poverty of their appearance, *Matemans*; also, from their patron saint, *Brethren of St. Alexius*; and on account of their dwelling in cells, *Frates Cellita*. In the frequent pestilences of that period, the Lollards were useful and everywhere welcome, and the order spread through the Netherlands and Germany. Owing to the fact that they were persecuted and reproached with heresy by the clergy and begging-friars, their name was afterward very commonly given to different classes of religionists; and in England it became a designation of the followers of Wycliffe.

French Academy, The, had its origin in a literary coterie which held meetings in Paris during the time of Louis XIV., and its purpose and unity were given to it by Cardinal Richelieu. His object was to have a fixed standard of grammar and rhetoric given to the language, believing that this would tend to the unification and peace of France. The duties which were imposed upon the members of the Academy were "to purify and fix the national tongue, to throw light upon its obscurities, to maintain its character and principles, and at their private meetings to keep this object in view. Their discussions were to turn on grammar, rhetoric, and poetry; their critical observations on the beauties and defects of classical French authors, in order to prepare editions of their works, and to compose a new dictionary of the French language." The original Academy was swept away in 1793, and the present Academy preserves but little of its original character of a mere coterie of grammarians. This present Academy came into existence with the restora-

tion of the Bourbons. It meets at the Palace Mazarin, Paris. Its chief officer is its secretary, who has a life tenure of his position. He receives a salary of 12,000 francs a year, the society being allowed by the Government 85,000 francs a year for the payment of its officers and the care of its library. The Academy is always to consist of forty members, all vacancies being filled by the votes of those already composing the body. To belong to it is regarded as a high honor, the members being spoken of as "the forty immortals."

Majolica Ware was first manufactured in the island of Majolica, and from thence the art was taken to Italy, where, during the fourteenth and fifteenth centuries, it was carried on to a considerable extent. A factory for manufacturing this ware was established in Fayence, France, in the latter century, and the name faience was substituted for that of majolica. About 1580, plates and other ware were manufactured in Italy, decorated with subjects derived from the compositions of Raphael and Marc Antonio, and painted in gay and brilliant colors. The establishment was abandoned in 1574, but pieces of majolica continued to be fabricated in various cities of Italy till the eighteenth century. During the decadence of the art of making enameled pottery in Italy, it flourished greatly in France at the famous Palissy pottery works at Paris and the factories at Nevers and Ronen, where it was manufactured till the end of the seventeenth century.

The Boxers are a Chinese secret society, partly religious and partly patriotic. The Chinese name of the society is Yi-Ilo-Chuan, meaning in English, "righteousness, harmony, and 'fists'"; the derived name "boxers" has evidently been applied because of the athletic aspect the society first assumed. It was first organized in groups which began gymnastic exercises in the Chinese villages, and drilling as a military organization was quickly developed, with broadswords for arms. On account of the swords the boxers have also been known as the "Big Knives." They first made themselves felt in Shan-Tung province, where the Germans secured the lease of Kiao-Chou bay, and large railroad and mineral rights. Each band, it is said, is governed by a "demonized" leader, who, by the selection of an epileptic patient, or, by the aid of hypnotism, causes a medium to display wild and unnatural symptoms, or to utter wild and strange speech, this serving as a basis for the claim of the society to spiritual power. Every boxer is assured of immunity from death or physical injury. The assault upon Christianity by the Boxers was particularly directed against native converts,

but later developed into a general anti-foreign crusade. Though revolutionary in their methods they profess fealty to the reigning dynasty, and devotion to the ancient religion, while attacking the foreign influences which they believe to be undermining the ancient institutions and nationality of China.

Libraries, Foreign.—First among the libraries of Great Britain, and second to few, if any, on the continent, is that of the British Museum. It contains about 1,300,000 printed volumes, besides rare and extensive collections of manuscripts, maps, prints, and drawings. Next in rank is the Bodleian or Bodleian Library at Oxford, which contains 300,000 volumes in addition to 20,000 to 30,000 in manuscript. The third and fourth places are occupied by the Public or University Library of Cambridge, and the Library of the Faculty of Advocates at Edinburgh, which are nearly on a par as regards extent and value, containing not less than 265,000 volumes each. The Library of Trinity College, Dublin, with about 192,000 volumes, is the largest and most valuable in Ireland. These five libraries have long been, and still are, entitled by statute to a free copy of every book published in the empire. The great National Library of France—*La Bibliothèque du Roi*, as it used to be called, *La Bibliothèque Nationale*, as it is called at present—is one of the largest and most valuable collections of books and manuscripts in the world. The number of printed volumes contained in it is estimated at nearly 2,500,000, and of manuscripts at about 150,000. Among libraries of the second class in Paris, the Arsenal Library with 300,000 volumes, the Library of Ste. Genevieve with 200,000, and the Mazarine Library with 160,000, are the chief. In Italy the Library of the Vatican at Rome stands pre-eminent. The number of printed volumes is only about 200,000, but the manuscript collection is the finest in the world. The Casanata Library, also at Rome, is said to contain 120,000 volumes; the Ambrosian Library at Milan, 140,000 volumes; the Magliabechi Library at Florence, 200,000 volumes; the Royal Library at Naples, 200,000 volumes; the Library of St. Mark's at Venice, 120,000 volumes and 10,000 manuscripts. The Laurentian Library at Florence consists almost entirely of manuscripts. The principal libraries of Spain are the Biblioteca Nacional at Madrid, numbering nearly 430,000 volumes, and the Library of the Escorial, which contains numerous manuscript volumes, treasures of Arabic literature. The Imperial Library at Vienna is a noble collection of not fewer than 400,000 volumes, of which 15,000 are of the class called *incunabula*, or books printed before

the year 1500. The Royal Library at Munich contains 900,000 volumes, including 13,000 *incunabula*, and 22,000 manuscripts. The Royal Library at Dresden is a collection of 500,000 volumes, among which are included some of the scarcest specimens of early printing, among others the Mainz Psalter of 1457, the first book printed with a date. The Royal Library of Berlin contains about 700,000 volumes of printed books, and 15,000 volumes of manuscripts. Of the other libraries in Germany, that of the University of Göttingen contains upward of 500,000 volumes, the Ducal Library of Wolfenbüttel about 270,000 volumes, and the University Library at Strasburg over 513,000 books and manuscripts. In Holland, the principal library is the Royal Library at The Hague, containing about 200,000 printed volumes. The Royal Library at Copenhagen contains nearly 550,000 volumes. The largest library in Sweden is that of the University of Upsala, consisting of nearly 200,000 volumes. One of its chief treasures is the famous manuscript of the Gothic Gospels of Ulfilas, commonly known as the *Codex Argenteus*. The number of volumes in the Imperial Library of St. Petersburg, Russia, is estimated to be at least 900,000, in addition to 35,000 manuscripts.

Church of England.—The exact date of the founding of this branch of the universal church is not known. British bishops sat in the Council of Arles 314 A. D. When the Roman mission under Augustine landed in 597 they found the Church organized in Britain and were directed by the Pope not to interfere with local usage as being that of an autonomous church. The continued aggressions of the Papacy, backed by political pressure, gradually brought both the throne of England and the Church into subjection to Rome; which process culminated when John delivered over perforce his kingdom and the church, 1213 A. D. In 1357 Edward III. supported the English bishops in their refusal to pay arrears of tribute to the See of Rome. Wycliffe, some years later, began his crusade against Papal oppression, and when, in the 16th century, the private quarrel of Henry VIII. with the Pope arose, the mind of the Church was ripe to seize it as the opportunity for a complete breach with the Roman polity though not with the Catholic religion. Henry was declared "Head of the Church in so far as the Law of Christ doth allow." In the reign of the boy-king, Edward VI., the continental reformers, during a brief period, greatly influenced the English church; but under Elizabeth and her successors the Catholic religion was restored, cleared of errors

and abuses both Protestant and Papal, and the influence of the Crown was invariably against the Puritans in their efforts to bring the historic church in England to an end. Elizabeth constantly spoke of herself as a "Catholic Sovereign," and refused to allow the English bishops to sit in council save as Catholic bishops. The Protestant Reformation left the Church of England essentially unchanged, and in possession of primitive polity, Apostolic order, and the Catholic faith. With the Church of England are allied by Apostolic succession and existing inter-communion the churches of Scotland and Ireland, together with the church in the United States known as the Episcopal Church.

Christian Association, Young Men's.

—Associations of young men for Christian work have existed in Great Britain and Ireland for upward of two centuries, and also in Germany and Switzerland. In 1710 it is recorded that Cotton Mather addressed kindred societies in New England, which were known as "Young Men Associated." In 1849, the societies which had been established in Germany took a wider scope, and from these associations grew the German associations of the present day. The English Young Men's Christian Association commenced in a meeting of clerks organized by George Williams in a mercantile establishment in London in 1844. The example of the British metropolis was speedily followed by the various cities of Great Britain founding associations, and in December, 1851, America caught the enthusiasm of the movement, and formed an association in Montreal, modeled after the one in London. Then Boston undertook the formation of one for itself, and their growth and influence since that time have been simply wonderful. They now flourish in every Protestant Christian country; and in almost every place where a colony of Christians are gathered, these associations are to be found.

Blind, Education of The.—The main end to be sought in the education of the blind is to fit them to compete in as many ways as possible with the more fortunate who can see, and take them out of their despondency and give them a worthy object to accomplish in life. The first institution for the blind was founded in Memmingen by Weef VI. in 1178, the second in Paris by Louis IX. in 1260, and the first for the employment of the adult blind in Edinburgh by Dr. Johnston in 1793. The work in a school for the blind is about equal to the ordinary high school course. Pupils are classified as in other schools; but persons who become blind at the age of twenty, for instance, must begin with the alphabet, as little children

do. Writing is taught by tracing with a pencil letters sunk into a stiff card. This manner of writing can be read by seeing persons only. The point systems — Braille's and Waite's — are generally used by blind persons to communicate with each other. In the Illinois Institution for the Blind the use of the typewriter is being taught, and it is said that some excellent work has already been done by the pupils. In the study of music the notes are read to the pupil, who writes them down in the Braille or Waite systems, and then studies them at the instrument until they are memorized. In most schools books in raised print are used. The first book of this character was printed in Paris in 1784 by M. Valentine Haüy.

Gnostic, a word sometimes confounded with *agnostic*, and employed in a loose and general way to designate a freethinker. Correctly speaking, gnosticism is the term applied to various forms of philosophical speculation which sprang up in the early history of the Church. They were generally regarded as heretical, but the term itself means simply *knowledge*, and does not contain any idea of antagonism to Judaism or Christianity. There were three main schools, or centers, of gnostic speculation: the Syrian of Antioch; the Alexandrian of Egypt, and that of Asia Minor, represented by Marcion of Pontus. Gnosticism represents the first efforts to construct a philosophical system of faith, and the main questions with which it concerned itself were the same which in all ages have agitated inquiry and baffled speculation — the origin of life and origin of evil, how life sprang from an infinite source, how a world so imperfect as this could proceed from a supremely perfect God. All of the schools agreed in the existence of an infinitely Supreme Being, their differences arising in their various speculations to account for the passage from the higher spiritual world to this lower material one. In the Alexandrian thought, evil is but degenerated good. The Syrian school assumed the existence of two living, active, independent principles, good and evil. The former system embraced Judaism as a divine institution, although inferior and defective in its manifestation of the divine character; the latter rejected it as being wholly the work of the Spirit of Darkness. The anti-Judaical spirit was developed to the extreme in Marcion and his followers. The gnostics accepted Christ, but in different and modified lights. According to the Alexandrian school, he is a higher Divine Being, proceeding from the Spiritual Kingdom for the redemption of this lower material kingdom; but however superior, he is

yet allied to the lower angels and the Demiurgos, who is an inferior manifestation of Deity partaking of the Divine nature, the intermediary between the Infinite Spirit and the material world, and the immediate creator and governor of this world. The Syrian school, on the other hand, regarded Christ as a being totally distinct from the Demiurgos, who was in their system not the representative and organ of the Supreme Spirit, but a rival Spirit of Darkness; and hence, in coming into this lower world, he was invading the realms of the powers of darkness, in order to seek out and rescue any higher spiritual natures who were living here under the power of the Evil One. Gnosticism has been well termed an extraordinary conglomeration of Monotheism, Pantheism, Spiritualism, and Materialism. It was vague, confused, and irrational for the most part, and yet its influence in the world was not altogether bad. It compelled Christian teachers to face the great problems of which it attempted the solution in so many fantastic forms. It expanded the horizon of controversy within as without the Church, and made the early fathers feel that it was by the weapons of reason and not of authority that they must win the triumph of Catholic Christianity. It may be said to have laid the foundations of Christian science; and Antioch and Alexandria, the centers of half-pagan and half-Christian speculation, became the first centers of rational Christian theology. The several schools began to decline after the middle of the third century. Their doctrines were revived several times by certain sects in the middle ages, but have had no considerable body of adherents since the thirteenth century.

Hades. — The word "hades" is from the Greek. Its etymology is somewhat doubtful, but it is generally believed to have come from the verb *eidein*, meaning to see, and the negative particle *a*. Hence it may mean what is out of sight, the invisible, or, where nothing can be seen, the place of darkness. In Homer the name is applied to Pluto, the lord of the lower regions, perhaps because he was the deity who had the power of making mortals invisible. The Greeks, however, gave up the latter application of the word, and when the Greek Scriptures were written the word was always used to designate the place of departed spirits. It was the common receptacle of departed spirits, the good as well as the bad, and was divided into two parts — the one an Elysium of bliss for the good, the other a Tartarus of punishment and grief for the wicked, and its locality was supposed to be underground in the mud regions of the earth. In the very early stages of Grecian history no

complete theory of punishments or rewards in hades had found its way into the popular creed. The prevalent belief was merely that the souls of the departed — with the exception of a few who had personally offended against the gods — were occupied in the lower world in the unreal or shadowy performance of the same actions that had employed them when in the region of day. The poets and dramatists introduced the accessories of tribunals, trials of the dead, a paradise for the good, and place of torture for the bad. The modes of punishment imagined were ingenious, such as that of Ixion, who was bound to an ever-revolving wheel; that of Sisyphus, who was set to roll a huge stone up a steep hill, a toil never ending and still beginning, for as soon as it reached the summit it rolled back again to the plain; or that of Tantalus, who was placed up to his chin in the water, but was unable to quench his thirst, as the water constantly slipped away from him as he raised it to his lips. Over his head also hung a branch loaded with fruit, but, as he stretched forth his hand to grasp it, it sprang from him toward the clouds. It is plain that these punishments had their origin in the imagination of poets rather than of priests or religious teachers.

Illiteracy of Various Nations.—In Russia, Servia, Roumania, and Bulgaria over 80 per cent. of the population are illiterate, Spain 63 per cent., Italy 48 per cent., Hungary 43 per cent., Austria 39 per cent., Ireland 21 per cent., France and Belgium 15 per cent., Holland 10 per cent., United States (whites) 8 per cent., Scotland 7 per cent., Switzerland 2.5 per cent., some parts of Germany 1 per cent. In Sweden, Denmark, and Bavaria, Wurtemberg and Saxony, only rarely a person cannot write.

Hanging Gardens of Babylon.—The Hanging Gardens of Babylon, so celebrated among the Greeks, contained a square of four plethra — that is, 400 feet on every side — and were carried up aloft into the air in the manner of several large terraces, one above another, till the height equaled that of the walls of the city. The ascent was from terrace to terrace by stairs ten feet wide. The whole pile was sustained by vast arches, raised upon other arches, one upon another, and strengthened by a wall, surrounding it on every side, of twenty-two feet thickness. On the top of the arches were first laid large flat stones, sixteen feet long and four broad; over these was a layer of reeds, mixed with a quantity of bitumen, upon which were two rows of bricks, closely cemented together with plaster. The whole was covered with thick sheets of lead, upon which lay the mold of the garden; and

all this flooring was contrived to keep the moisture of the mold from running away through the arches. The mold, or earth, laid thereon was so deep that the greatest trees might take root in it; and with such the terraces were covered, as well as with all other plants and flowers that were proper for a garden of pleasure. In the upper terrace there was an engine or kind of pump by which water was drawn up out of the river, and from thence the whole garden was watered. In the spaces between the several arches, upon which the whole structure rested, were large and magnificent apartments that were very light, and had the advantage of an exceedingly beautiful prospect.

Pan, the chief Grecian god of pastures, forests, and flocks. He was, according to the most common belief, a son of Hermes by a daughter of Dryops, or by Penelope, the wife of Ulysses; while other accounts make Penelope the mother, but Ulysses himself the father — though the paternity of the god is also ascribed to the numerous wooers of Penelope in common. The original seat of his worship was the wild, hilly, and wooded solitudes of Arcadia, whence it gradually spread over the rest of Greece, but was not introduced into Athens until after the battle of Marathon. He is represented as having horns, a goat's beard, a crooked nose, pointed ears, a tail, and goat's feet. He had a terrible voice, which, bursting abruptly on the ear of the traveler in solitary places, inspired him with a sudden fear (whence the word panic). He is also represented as fond of music and of dancing with the forest nymphs, and as the inventor of the syrinx or shepherd's flute, also called Pan's pipe. The fir tree was sacred to him, and he had sanctuaries and temples in various parts of Arcadia, at Troezen, at Sicyon, at Athens, etc. When, after the establishment of Christianity, the heathen deities were degraded by the Church into fallen angels, the characteristics of Pan — the horns, the goat's beard, the pointed ears, the crooked nose, the tail, and the goat's feet — were transferred to the devil himself, and thus the "Auld Hornie" of popular superstition is simply Pan in disguise.

Æsthetics is a term invented about the middle of the last century by Baumgarten, a Professor of Philosophy in the University of Frankfort-on-the-Oder, to denote the science of the Beautiful, particularly of art, as the most perfect manifestation of the Beautiful. Notwithstanding the fact that the Beautiful was a favorite subject of contemplation among the ancients, Baumgarten is held to be the first who considered the subject from the true

scientific point of view, and therefore entitled to be called the founder of the philosophy of art. All sensuous apprehension, not in one form or manifestation only, but in every possible form or manifestation, was included in his view of the subject, and this conception he expressed by the word *Æsthetics*, from the Greek *aisthanomai*, I feel—indicating not absolute or objective knowledge of things, but such as is conditioned subjectively by the play of our sensibilities. Beauty was, with Baumgarten, the result of the highest and purest æsthetic perception, to the realization of which

the finer portion of our nature aspires; and to trace which, through the whole sphere of art, was the work of æsthetic philosophy.

COMPULSORY SCHOOL LAWS.

United States.—Thirty-two States and two Territories have passed compulsory school laws defining the ages to which the law shall apply, the annual term of school attendance, and the penalty imposed upon parents or guardians for violation of the law.

These requirements are summarized in the following table:—

Compulsory Education Requirements in the United States.

| STATE. | AGE. | ANNUAL PERIOD. | PENALTY ON PARENTS OR GUARDIANS. |
|-------------------------|--------------|--|---|
| Maine | 8-15 | 16 weeks (2 terms of 8 weeks each, if practicable). | Fine, \$25 (maximum). |
| New Hampshire | 6-16 | 12 weeks | Each offense, \$10 (maximum). |
| Vermont | 8-15 | 20 weeks | Fine, \$10 to \$50. |
| Massachusetts | 8-14 or 15 | 30 weeks | Each offense, forfeit not exceeding \$30. |
| Rhode Island | 7-15 | 12 weeks; 6 consecutive | Each offense, fine \$20 (maximum). |
| Connecticut | a 8-14 or 15 | 8 to 13 years of age, 24 weeks; 13 to 14, 12 weeks. | For each week's neglect, fine \$5 (maximum). |
| New York | a 8-14 | 8 to 12 years of age and unemployed youths 14 to 16, full term; for children 12 to 14, at least 80 days consecutive. | First offense, fine \$5 (maximum); each subsequent offense, \$50 (maximum) or imprisonment 30 days. |
| New Jersey | b 7-12 | 20 weeks; 8 consecutive | Each offense, \$10 to \$25, or imprisonment 1 to 3 months. |
| Pennsylvania | a 8-13 | 70 per cent. of the entire term. | First offense, \$2 (maximum); each subsequent offense, \$5 (maximum). |
| District of Columbia .. | c 6-15 | 12 weeks; 6 consecutive | Fine, \$20 (maximum). |
| West Virginia | 8-14 | 16 weeks | Fine, not exceeding \$5. |
| Kentucky | 7-14 | 8 consecutive weeks | Fine, \$5 to \$20 (first offense); \$10 to \$50 each subsequent offense. |
| Ohio | a 8-14 | 20 weeks, city district; 16 weeks, village and township districts. | Fine, \$5 to \$20. |
| Illinois | 7-14 | 16 weeks; 8 consecutive | Fine, \$3 to \$20. |
| Indiana | 8-14 | 12 consecutive weeks | \$10 to \$50; also, if court so orders, imprisonment 2 to 90 days. |
| Iowa | 7-14 | 16 consecutive weeks | Fine of not less than \$3 nor more than \$30 for each offense. |
| Michigan | d 8-14 | 16 weeks; 6 consecutive | First offense, \$5 to \$10; each subsequent offense, \$10 (minimum). |
| Wisconsin | 7-13 | 12 weeks | Fine, \$3 to \$20. |
| Minnesota | 8-16 | 12 weeks; 6 consecutive | First offense, \$10 to \$25; each subsequent offense, \$25 to \$50. |
| North Dakota | 8-14 | Full term | First offense, \$5 to \$20; each subsequent offense, \$10 to \$50. |
| South Dakota | 8-14 |do | Fine, \$10 to \$20. |
| Nebraska | 8-14 | 12 weeks | Each offense, \$10 to \$50. |
| Kansas | 8-14 | 12 weeks; 6 consecutive | First offense, fine \$5 to \$10; each subsequent offense, \$10 to \$20. |
| Montana | 8-14 |do | Each offense, \$5 to \$20, or 30 days' imprisonment. |
| Wyoming | e 6-21 | 12 weeks | Each offense, \$25 (maximum). |
| Colorado | 8-14 | 12 weeks; 8 consecutive | Each offense, \$5 to \$25. |
| New Mexico | 8-16 | 12 weeks | Fine, \$1 to \$25, or imprisonment for not more than 10 days. |
| Utah | 8-14 | 16 weeks; 10 consecutive | First offense, \$10 (maximum); each subsequent offense, \$30. |
| Nevada | c 8-14 | 16 weeks; 8 consecutive | First offense, \$50 to \$100; each subsequent offense, \$100 to \$200. |
| Idaho | 8-14 |do | First, \$5 to \$20; subsequent offenses, \$10 to \$50. |
| Washington | 8-15 | 12 weeks | Fine, \$10 to \$25. |
| Oregon | 8-14 | 12 weeks; 8 consecutive | First offense, \$5 to \$25; subsequent offense, \$25 to \$50. |
| California | 8-14 | Two thirds of school term; 12 weeks consecutive. | First offense, \$20; each subsequent offense, \$20 to \$50. |

a To 16 if unemployed in labor.

b The law applies to youths 12 to 16 years of age if discharged from employment in order to receive instruction.

c Law not enforced.

d In cities, 7 to 16.

e Penalty imposed only for children 7 to 16.

Compulsory Education in Foreign Countries.

| COUNTRY. | AGE. | ATTENDANCE REQUIRED. | PENALTY. |
|----------------------------|--------|---|---|
| Austria..... | 6-14 | Until scholar has acquired prescribed subjects, religion and reading, writing and arithmetic. | Fine, \$3.50 (maximum), or imprisonment up to 2 days. |
| Bavaria..... | a 6-14 | Do..... | Fine, \$11 (maximum), or 8 days' imprisonment. |
| Belgium..... | | No compulsory law..... | |
| France..... | 6-13 | For 4 absences of half a day in a month the parent is summoned before local school committee. | First and second offenses, warning; subsequent fine, \$3 (maximum) and imprisonment 5 days. |
| England..... | 5-13 | Full school term unless by special arrangement. | Determined by local by-laws. |
| Scotland..... | 5-13 | Do..... | Fine, \$5, or imprisonment 14 days. |
| Holland..... | | No compulsory law..... | |
| Hungary..... | b 6-12 | 8 months, country; 10 months, town. | Fine, from 35 cents to \$1.50. |
| Italy..... | 6-9 | No fixed rule..... | Each offense, 10 cents to \$2. |
| Norway..... | (c) | 12 weeks per annum..... | Fines. |
| Prussia..... | 6-14 | 8 years, or until elementary education is completed. | Each offense, 70 cents (maximum), or imprisonment up to three days. |
| Saxony..... | d 7-15 | Same as Austria..... | Fine, \$1.50 to \$7.00, or imprisonment from 1 day to 6 weeks. |
| Sweden..... | 7-14 | 34½ weeks..... | |
| Berne..... | 6-15 | Five sixths of possible attendances. | Fines and imprisonment. |
| Geneva..... | 6-15 | 4 days a week, 6 hours a day.. | Do. |
| Neuchâtel..... | 7-16 | After 13 years of age, 10 hours a week. | Fine, 35 cents (minimum), or imprisonment 30 days (maximum). |
| Tessin (Switzerland)..... | 6-14 | 28 hours a week for 6 to 9 months. | Each offense 2 to 3 cents, and 4 hours' imprisonment. |
| Vaud (Switzerland)..... | 7-16 | 33 hours a week..... | |
| Grisons (Switzerland)..... | 7-15 | Every day; penalties for 10 absences. | Fines or imprisonment. |
| Zurich..... | 6-16 | Every school day..... | Warnings; subsequently fines, 60 cents to \$5. |
| Wurttemberg..... | 6-14 | Every school day..... | Fine or imprisonment. |
| British Columbia..... | 7-12 | No compulsory law..... | Do. |
| Cape Colony..... | | One half the period during which the school is open. | |
| New Zealand..... | 7-13 | 80 days a year..... | Fine, \$10 (maximum). |
| Nova Scotia..... | 7-12 | 100 days a year..... | Fine, \$2. |
| Ontario..... | 7-13 | 13 weeks a year..... | \$1 per month for each of the children not attending a school. |
| Prince Edward Island..... | 8-13 | No compulsory law..... | Fine. |
| Quebec..... | | 60 days in each half year, but law not yet enforced. | |
| Queensland..... | 6-12 | 35 school days per quarter.... | Fine, \$5 to \$25, or imprisonment 7 to 30 days. |
| South Australia..... | 7-13 | 3 days a week..... | Fine, \$1.25 to \$5. |
| Tasmania..... | 7-13 | | |

a 13 to 16 in secular Sunday Schools.

b 12 to 15 continuation.

c From 8 until confirmation; in town from 7 until confirmation.

d Special dispensation after 7 years' attendance and 1 year's prolongation for ignorance.

Halacha is the term for the Jewish oral law, and is supposed to be, like the written law contained in the Bible, of divine origin. It embraces the whole field of juridico-political, religious, and practical life down to its most minute and insignificant details. It began to be written down when the sufferings to which the Jews were almost uninterruptedly subjected from the first exile downward had made many portions of it already very uncertain and fluctuating, and threatened finally to obliterate it altogether from memory. The first collection of laws was instituted by Hillel, Akiba, and Gamaliel; but the final reduction of the general code, Mishna, is due to Jehudah Hanassi, A. D. 220. The Halacha was further developed in subsequent centuries by the Saboraim, Geonim, and the authorities of each generation.

Oneida Community is a society of Perfectionists, or Bible Communists, founded by John Humphrey Noyes. He was originally a lawyer, then studied theology at Andover and Yale, and became a Congregational minister, but soon lost his license to preach on account of the views which he adopted. The Community is situated on Oneida Creek, in Lenox township, Madison County, N. Y., where it owns a fine estate. The Community was the outgrowth of the teachings of Noyes and a circle of believers at Putney, Vermont, where Noyes settled in 1838. At first there was no thought of becoming a Community, exclusive attention being paid to the development and publication of their religious views. The communistic manner of life was adopted gradually. In 1846, they disbanded owing to offense given to their neighbors, but in 1847

they united with another Community which had been started under the influence of the Putney school, in Madison County, N. Y., where they carried on their communistic views for nearly thirty years with pecuniary success and with comparative freedom. The Community was a large family or brotherhood, the common bond being paramount. The children were regarded as belonging primarily to the Community. All property was held in common and the education and subsistence afforded to the members were considered a just equivalent for their labor. For government and religion, they relied chiefly upon the power of their religion, but they also used a system of public censorship called by them "mutual criticism." The cardinal principles of the Community are: reconciliation to God, salvation from sin, recognition of the brotherhood and equality of man and woman, and the community of labor and its fruits. They believe that the second coming of Christ took place in 70 A.D., at the destruction of Jerusalem, and they look forward to His third coming.

In 1879 the obnoxious social features were abandoned, owing to public opinion which had been aroused by the clergy of the state and particularly by those of the surrounding region. Mr. Noyes, having been threatened with arrest, had fled to Canada and urged the Community to take this step. On January 1, 1881, the property was divided and the members were incorporated under the laws of the state of New York as a joint stock company, in which capacity they have carried on business ever since. At the time of the dissolution of the Community, it had about 238 members, with 45 others at a branch at Wallingford, Connecticut; owned 650 acres of land with numerous manufacturing establishments and other buildings, the total property being valued at \$600,000. It has since largely increased its property and business, having manufactories at Kenwood, Sherrill, and Niagara Falls, N. Y., and at Niagara Falls, Ontario. While communism of property and distinctive social life were given up, a common dining room, laundry, library, and assembly hall, and other coöperative features are still retained. The present membership is about three hundred.

Pagodas are in most instances pyramidal-shaped temples consisting of various layers of stones piled one upon another in successive recession, and covered all over with the richest ornamentation. They are among the most remarkable monuments of Hindoo architecture. The pilasters and columns, which take a prominent rank in the ornamental portion of these temples, show the greatest variety of forms; some pagodas are also overlaid with stripes of cop-

per, having the appearance of gold. Though the word pagoda is used to designate but the temple, it is in reality an aggregate of various monuments, which in their totality constitute the holy place sacred to the god. Sanctuaries, porches, colonnades, gateways, walls, tanks, etc., are generally combined for this purpose according to a plan which is more or less uniform. Several series of walls form an inclosure; between them are alleys, habitations for the priests, etc.; and the interior is occupied by the temple itself, with buildings for the pilgrims, tanks, porticoes, and open colonnades. The walls have, at their openings, large pyramidal gateways higher than themselves, and so constructed that the gateway of the outer wall is always higher than that of the succeeding inner wall. These gateways are pyramidal buildings of the most elaborate workmanship, and consist of several, sometimes as many as fifteen, stories. The pagoda of Chalambron, in Tanjore, is one of the most celebrated and most sacred of these monuments in India. The buildings of which this pagoda is composed cover an oblong square 360 feet long and 210 wide. The pagodas of Juggernaut on the north end of the coast of Coromandel are three in number, and are surrounded by a wall of black stone, whence they are called by Europeans the Black Pagodas. The height of the principal one is said to be 344 feet; according to some, however, it does not exceed 120-123 feet. The term pagoda is also applied, but not correctly, to those Chinese buildings of a tower form, as the Porcelain Tower of Nanking. These buildings differ materially from the Hindoo pagodas, not only as regards their style and exterior appearance, but inasmuch as they are buildings intended for other than religious purposes. The word pagoda is, according to some, a corruption of the Sanskrit word *bhāgavata*, from *bhagavat*, sacred; but according to others, a corruption of *put-gada*, from the Persian *put*, idol, and *gada*, house.

Hampshire Shakers.—This community of Shakers settled in the New Forest, near Lymington, Hampshire, England, in 1872 or 1873, and consisted of eighty-three persons. Their leader, a Mrs. Girling, wife of an Ipswich builder, declared herself to be the woman of the twelfth chapter of Revelations, who was "clothed with the sun, and the moon under her feet." These Girlingites, or Bible Christians, as they called themselves, believed that the earth and the fullness thereof belonged to the elect, and that they were the elect. They professed to take the literal scriptures for their guide in all things, yet were so little inclined to earn their bread by the sweat of their brow

that they got into debt, mortgaged the cottages which had been secured for them by a Miss Wood, a convert, and finally lost their property in 1878, when, as a community, they passed out of existence.

Pantheon of Rome, a famous temple of circular form, built by M. Agrippa, son-in-law of Augustus, in his third consulship, about 27 B. C. The edifice was called the Pantheon, not, as is commonly supposed, from its having been sacred to all the gods, but from its majestic dome, which represented, as it were, the "all-divine" firmament. It was dedicated to Jupiter Ultor. Beside the statue of this god, however, there were in six other niches as many colossal statues of other deities, among which were those of Mars and Venus, the founders of the Julian line, and that of Julius Cæsar. The Pantheon is by far the largest structure of ancient times, the external diameter being 188 feet, and the height to the summit of the upper cornice 102 feet, exclusive of the flat dome or calotte, which makes the entire height about 148 feet. It has a portico, in the style of the Corinthian architecture, 110 feet in length and 44 feet in depth, made up of 16 granite columns, with marble capitals and bases, placed in three rows, each column being 5 feet in diameter and 46½ feet high. These columns supported a pediment with a roof of bronze. The Pantheon stands near the ancient Campus Martius, and, after the lapse of 1900 years, is still the best preserved of the old Roman buildings. It was given to Boniface IV. by the Emperor Phocas in 609, and was dedicated as a Christian church to the Virgin and the Holy Martyrs, a quantity of whose relics was placed under the great altar. In 830, Gregory IV. dedicated it to all the saints. It is now known as the Church of Santa Maria Rotunda. This consecration of the edifice, however, seems to have afforded it no defense against the subsequent spoliation, both of emperors and popes. The plates of gilded bronze that covered the roof, the bronze bassi-relievi of the pediment, and the silver that adorned the interior of the dome, were carried off by Constans II., A. D. 655, who destined them for his imperial palace at Constantinople; but, being murdered at Syracuse when on his return with them, they were taken by their next proprietors to Alexandria. Urban VIII. carried off all that was left to purloin—the bronze beams of the portico, which amounted in weight to more than 45,000,000 pounds. During eight centuries it has suffered from the dilapidations of time and the cupidity of barbarians. The seven steps which elevated it above the level of ancient Rome are buried beneath the modern pavement. Its rotunda of

brick is blackened and decayed; the marble statues, the bassi-relievi, the brazen columns, have disappeared; its ornaments have vanished, its granite columns have lost their luster, and its marble capitals their purity. Yet, under every disadvantage, it is still pre-eminently beautiful. No eye can rest on the noble simplicity of the matchless portico without admiration. Its beauty is of that sort which, while the fabric stands, time has no power to destroy.

Oracles dated from the highest antiquity, and flourished in the most remote ages. The word signifies the response delivered by a deity or supernatural being to a worshiper or inquirer, and also the place where the response was delivered. These responses were supposed to be given by a certain divine afflatus, either through means of mankind, as in the oracles of the Pythia, and the dreams of the worshiper in the temples; or by its effect on certain objects, as the tinkling of the caldrons at Dodona, the rustling of the sacred oak, the murmuring of the streams; or by the action of sacred animals, as exemplified in the Apis or sacred bull of Memphis, and the feeding of holy chickens of the Romans. These responses, however, had always to be interpreted to the inquirer by the priesthood. It is probable that all the Egyptian temples were oracular, although only a few are mentioned by Herodotus, as the oracles of Latona in the city of Buto; those of Hercules, Mars, Thebes, and Meroë. Oracles were also used by the Hebrews. The Grecian oracles enjoyed the highest reputation for truthfulness, and the most renowned of all was the Delphic Oracle. Sacrifices were offered by the inquirers, who walked with laurel crowns on their heads, and delivered sealed questions; the response was deemed infallible, and was usually dictated by justice, sound sense, and reason, till the growing political importance of the shrine rendered the guardians of it fearful to offend, when they framed answers in ambiguous terms, or allowed the influence of gold and presents to corrupt the inspirations. There were numerous other oracles in Greece and in Asia Minor, and written ones existed of the prophecies of celebrated seers. Those of the Sibyls or prophetic women enjoyed great popularity.

Holy Grail.—The Holy Grail was one of the leading themes of mediæval romance, fabled to have been the cup or chalice used by Christ in the Last Supper, and in which he changed the wine into blood. This chalice, preserved by Joseph of Arimathea, had also received the blood which flowed from the side of Christ on the cross. This is what the apocryphal gospel of Nicodemus says, but no

early mention is made of it by either profane or ecclesiastical writers. In the twelfth century it reappears as the central subject of the prophecies of Merlin and the object of the adventurous quest of the Knights of the Round Table. It was also mixed up, by romance, with the struggles in Spain between Moors and Christians, and with the foundation of the Order of Templars in Palestine.

Peter the Hermit was the apostle of the first crusade, and was born in the diocese of Amiens, France, about the middle of the eleventh century. After engaging in several pursuits he became a hermit, and in 1093 un-

dertook a pilgrimage to Jerusalem, where the oppression he witnessed and experienced determined him to arouse the people of Christendom to undertake a war for the liberation of the holy sepulcher. The first host of crusaders was led by Peter in person, and was unsuccessful. He was associated with the expedition under Godfrey of Bouillon. While the crusaders were besieged in Antioch, he deserted, but was captured and brought back. On the conquest of Jerusalem he preached a sermon to the crusaders on the Mount of Olives. After this he returned to Europe and founded the Abbey of Neufmoustier, near Huy, where he died in 1115.

* All departments.

† Co-education of the sexes.

‡ Education of women only.

§ For the education of colored students.

¶ Teachers College is now part of Columbia University.

|| Medical Department at Mobile, Ala.

|| At Athens, Tenn., also.

a Co-education in Medical Department.

c No restriction as to color.

d Certain courses, with use of library, are open to women in Columbia University who are students of Barnard or Teachers College.

e Co-education in the literary departments.

f Confined strictly to post-graduate work. The national university of the church.

g Academic and Technical Departments at Fayetteville; Law and Medical Departments at Little Rock; Normal School (for negroes), Pine Bluff, Ark.

h Presbyterian in sympathy.

i For Indians and colored youth, both sexes.

k Also at Lancaster, Tex.

m Located in Pittsburg and Allegheny.

n Separate department for women in the H. Sophie Newcomb Memorial College.

o For both sexes, except that Adelbert College Annex is for women only.

p Dental and Law Schools at Chicago.

q Report at close of 1900.

r Schools of Pharmacy and Medicine at Chicago.

s Medical Department at Galveston.

t President and two-thirds Trustees must be Baptists.

u School of Mines at Rolla, Mo.

v Women admitted to graduate school and Departments of Fine Arts and Music.

w Co-education in law, pedagogy, graduate, and commerce. The University proper is at University Heights, Bronx Borough, New York; Law School at Washington Square, New York.

z College of Liberal Arts at St. Paul, Minn.; College of Physicians and Surgeons at Minneapolis.

y Medical Department located in Louisville.

Humanities are those branches of education or study which are included in what are called polite or elegant learning, as languages, grammar, philosophy, and poetry, with that pertaining to what is called polite literature, including the ancient classics. The name implies that the study of these branches, in opposition to the physical sciences, which especially develop the intellectual faculties, has a tendency to humanize man, to cultivate particularly those faculties which distinguish him as man in all his relations, social and moral; that is, which make him a truly cultured man.

Animal Worship.—Among primitive peoples, all animals are supposed to be endowed with souls which in many cases have formerly animated human beings. Hence a likeness is often recognized between an animal and some deceased friend, and the animal is addressed as the person would have been, and honored with a kind of worship. Many tribes call themselves by the name of, and even derive their pedigree from, some animal. Its cries become the omens of the tribe; and thus originate the divination and augury of more civilized nations. In the modern world the

most civilized people among whom animal-worship vigorously survives lie within the range of Brahmanism. Here the sacred cow is not merely to be spared; she is as a deity worshiped and bowed to daily by the pious Hindoo. Siva is incarnate in Hanuman, the monkey god. The divine king of birds, Garuda, is Vishnu's vehicle, and the forms of fish and boar and tortoise assumed in the avatar legends of Vishnu. Perhaps no worship has prevailed more widely than that of the serpent. It had its place in Egypt and among the Hebrews; in Greece and Rome; among the Celts and Scandinavians in Europe; in Persia and India; in China and Thibet; in Mexico and Peru; in Africa, where it still flourishes as the state religion in Dahomey; in Java and Ceylon; among the Fijians and elsewhere in Oceanica; and even within the limits of Christianity we find the sect of the Ophites, who continued or renewed snake-worship, blended curiously with purer rites.

Pyramids.—The weight of authority among modern Egyptologists inclines to the view that the Pyramids were a new and bold architectural type, invented in its entirety between the fifth and twelfth dynasties, in Middle Egypt, and not the development from earlier forms of tomb-mounds. "Pyramid," in its strict geometrical sense, denotes a building having a polygonal base, and plain triangular sides which meet in an apex. There are various forms of ancient tomb-mounds of earth and stone and stepped structures, as the *mastaba* in Egypt, and early temples and mausolea in Mexico and Assyria, and there are also some inferior imitations of later date; but the true pyramidal construction is seen only in Egypt, and comprises about seventy structures on the banks of the Nile, none of which are later than the twelfth dynasty (about 2000 B. C.). They are all built upon a square base, with the four sides facing the four cardinal points of the compass, and in the earlier forms are composed of horizontal layers of rough-hewn blocks with a small amount of mortar—degenerating in the buildings of the sixth and succeeding dynasties to a cellular system of retaining walls filled with loose chips, and finally, in the twelfth dynasty, to a mass of mud bricks. But there was, in all cases, on the outside, a casing of fine stone, beautifully polished and jointed, the inner chambers having a similar finish. These casing stones were not a mere veneer or film, but were massive blocks, usually greater in thickness than in height. Inside of each pyramid, always low down, and usually beneath the level of the ground, was built a sepulchral chamber, and this was reached by a downward passage

from the north side. This passage had a lesser chamber in its course, and was blocked once or oftener with a massive stone portcullis. The interior was probably in every case accessible to the priests for the purpose of making offerings, the passageway being closed by a stone door turning on a horizontal pivot, the location of which was known to them. The chambers were always roofed by great sloping cantilevers of stone projecting from the north and south sides, on which they rested without pressing on each other along the central ridge, so that there was no thrust, nor indeed any force to disturb the buildings; and now, after a lapse of four thousand years, in spite of the brutal treatment of enemies and the greed of later builders (who have removed almost all of the casing stones), they still stand as colossal monuments of the work of man. Owing to the loss of the casing stones, their present appearance presents a series of huge, rough steps, and their height has been considerably diminished by the encroachment of the sand of the desert around their bases. Many archaeologists believe these vast piles, especially the great Pyramid of Cheops at Gizeh, to have been constructed under divine inspiration, and to embody in the living rock great astronomical facts and mathematical principles, and memorials of a system of weights and measures for universal use. It is also maintained that Masonic emblems and symbols have been found within them. Whatever the builders embodied in the details of their construction, their immediate object and use was undoubtedly to serve as royal mausolea. As for these theories, future investigations will probably develop or explode them; but that there is great mathematical knowledge and wonderful accuracy of measurement displayed in them is well established. In the great Pyramid at Gizeh, the four sides have a mean error of only six tenths of an inch, and twelve seconds in angle from a perfect square. This pyramid is the largest of all, and by far the most remarkable in its construction. It is somewhat different from the others in its internal arrangement, having the subterranean chamber, which is but half finished, and having also an upward passage leading to two large upper chambers, highly finished with great slabs of polished red granite. Probably both of these chambers contained originally a polished sarcophagus of the same Syenitic granite; and the larger one—the "King's"—although in the very heart of this huge pile, is perfectly ventilated by two air passages about nine inches square, which run to the north and south faces of the Pyramid. It was built by Cheops or Khufu of the fifth dynasty, and its

construction is thought to have employed 100,000 men for thirty years or more — probably half a century. The masonry consisted originally of 89,028,000 cubic feet, and still amounts to 82,111,000. The height is at present 450 feet (originally 479), and the length of the sides 746 feet (originally 764). The King's Chamber is 19 feet 1 inch in height, and in area 34 feet 3 inches by 17 feet 1 inch; the Queen's Chamber is 20 feet 3 inches in height, and in area 17 feet by 18 feet 9 inches. It is now generally agreed that there were no inscriptions on the external surface of any of the pyramids, the casing-stones bearing a smooth polish. The mechanical means employed by the builders have been partly ascertained. The hard stones, granite, diorite, and basalt, were, in all fine work, sawn into shape by bronze saws set with jewels (either corundum or diamonds); hollows were made (as in sarcophagi) by tubular drilling with tools like our modern diamond rock-drills, and small articles were turned in lathes fitted with mechanical tool rests and jewel pointed tools. The questions of the transport and management of such huge stones, weighing oftentimes more than thirty tons apiece, remain still to be answered.

Septuagint. — The most ancient Greek translation of the Old Testament that has come down to us, and the one commonly in use at the time of Christ, was the Septuagint. Its origin is shrouded in deep obscurity. There are a number of myths concerning it, but the principal one is that it was made during the reign of Ptolemy Philadelphus, 284-247 B. C. This king, it is stated, anxious to embody in a collection of laws of all nations, on which he was engaged, also those of the Jews, invited 72 men of learning and eminence from Palestine, who performed the task of translation in 72 days. The facts upon which this legend, now rejected as a piece of history, rests, cannot well be ascertained. It seems clear, however, that Ptolemy, aided by his librarian, Demetrius Phalereus, did cause a Greek version of the Pentateuch to be executed, probably during the time of his being co-regent of Ptolemy Lagi; but the translators were not Palestinian but Egyptian Jews. This is evidenced from the state of the text from which the translation must have been made, and from the intimate acquaintance with Egyptian manners and customs which it evinces. The Septuagint was held in the very highest repute among the Alexandrine Jews, while the Palestinians looked upon it as a dangerous innovation, and even instituted the day of its completion as a day of mourning. Gradually, however, it also found its way into Palestine.

It was read and interpreted in the synagogues for some centuries after Christ, until the increasing knowledge of the original, fostered by the many academies and schools, and the frequent disputations with the early Christians, brought other and more faithful and literal translations.

Holy Coat, a garment which is alleged to be the seamless coat of our Saviour, and to have been discovered in the fourth century by the Empress Helena on her visit to Palestine. It was deposited by her at Treves, where it is preserved in the cathedral of that city with the greatest reverence. The Treves relics were concealed from the Normans in the ninth century in crypts; but the Holy Coat was rediscovered in 1196, and then solemnly exhibited to the public gaze, which did not take place again till 1512, when Leo X. appointed it to be exhibited every seven years. In 1810 the exhibition was attended by 227,000 people, and in 1844 by still greater multitudes. The exhibition of the Holy Coat in this latter year led to the secession of the German Catholics from the Church of Rome.

Portland Vase. — The celebrated Portland Vase, which is one of the most valued relics of antiquity in the British Museum, was made, it is believed, to hold the ashes of the Roman Emperor Alexander Severus, and was discovered during the sixteenth century in a rich sarcophagus on Monte del Grano, where it had been for about thirteen hundred years. It is an urn, ten inches high. The groundwork is of blue glass, enameled with white glass cut in cameo, to represent the wedding of Thetis and Peleus. It was placed in the museum by the Duke of Portland in 1810, and in 1845 was maliciously broken by a man named Lloyd. The pieces, however, were collected and cemented together, but the vase has not been on exhibition since that date. It was at one time known as the Barberina Vase, and was owned by Sir William Hamilton, who found it in the Barberina Palace, and purchased it in 1770. In time it passed into the possession of the Duchess of Portland, and was disposed of as related.

Shakers is the popular name given to a religious sect who call themselves the "United Society of Believers in Christ's Second Appearing." They were founded in England about the year 1770 by an Englishwoman named Ann Lee, in whose person they believed that Christ has appeared a second time. Shortly before the outbreak of the Revolutionary War a small band of them, with Ann Lee at their head, emigrated to America, and penetrated far into the wilderness to Niskenna, and there founded the settlement, which still exists.

at Watervliet, N. Y. In the spring of 1780, when they had been three years and a half at Niskenna, a religious revival took place at Albany, and spread through the surrounding districts; and from Hancock and New Lebanon a deputation was sent to Niskenna, to see what light its inhabitants enjoyed as to the way of salvation. The deputation consisted of Joseph Meacham and Lucy Wright, subsequently the heads of the Shaker Society. These persons became believers in Ann Lee, and through their agency other converts were won, and a Shaker Society established at New Lebanon. Toward the close of 1780, the Revolutionary War being then in progress, notoriety was given to Ann Lee through an incident seemingly unfavorable. On suspicion of being a British spy she was imprisoned for some time at Poughkeepsie, and before she obtained her liberty, in December, 1780, all the colonies had heard of the "female Christ," and in the following year she started on a missionary tour through New England and the adjacent colonies, and made not a few converts. She died in 1784, and was succeeded in the headship of the society by Joseph Meacham and Lucy Wright. Her death was a surprise to many of her followers, who believed that she was to live with them forever. Their doctrine has been, to some extent, developed as well as systematized since the death of "Mother Ann." They believe that the Kingdom of Heaven has come; that Christ has come upon earth a second time in the form of "Mother Ann," and that the personal rule of God has been restored. Then they hold that the old law has been abolished and a new dispensation begun; that Adam's sin has been atoned; that man has been made free of all errors except his own; that the curse has been taken away from labor; that the earth and all that is on it will be redeemed. Believers, on going "into union," die to the world and enter upon a new life, which is not a mere change of life but a new order of being. For them there is neither death nor marriage; what seems death is only a change of form, a transfiguration, which does not hide them from the purified eyes of the saints; and in union, as in Heaven, there is no marrying nor giving in marriage. They believe that the earth, now freed from the curse of Adam, is Heaven; they look for no resurrection besides that involved in living with them in "resurrection order." The believer, upon entering into union, leaves behind all his earthly relationships and interests, just as if he had been severed from them by death. And since to be in union is heaven, the Shakers hold that no attempt should be made by them to draw men into union. They believe that

they live in daily communion with the spirits of the departed believers. The Shaker settlements are composed of from two to eight "families," or households. A large house, divided through the middle by wide walls, and capable of accommodating from 80 to 150 inmates, is erected by each family, the male members occupying one end and the female the other. Their meals are taken in a common room, and in silence. They possess an average of seven acres of land to the member, and are very industrious. The settlements are at New Lebanon and Watervliet, N. Y.; Hancock, Tyringham, Harvard, and Shirley, Mass.; Enfield, Conn.; Canterbury and Enfield, N. H.; Alfred and Gloucester, Me.; Union Village, White Water, and North Union, Ohio; and at Pleasant Hill and South Union, Ky., and number, in all, 2,400 members.

Roman Baths. These were among the most magnificent and extensive architectural ornaments of the city in the time of the Empire. They were erected by different emperors for the use of the populace, and the vast ruins still existing testify to their great size and the unparalleled luxury of their arrangements. In these great *thermae*, as they were called, the primitive object of bathing was largely lost sight of, and they became favorite places of general resort for pleasure. The most famous were those erected by the Emperors Titus, Caracalla, and Diocletian. Caracalla's baths were 1,500 feet long by 1,250 feet broad, and the swimming bath or *natatorium* in those of Diocletian was 200 feet long by 100 feet wide; and it is calculated that in this entire establishment 18,000 people could bathe at one time. There were separate structures for the exclusive use of women, and in some cases separate apartments in the same building, but these were generally inferior to those for the men. They were built entirely of stone and polished marble, and all the apartments were beautifully ornamented with mosaic, and profusely adorned with painting, stuccowork, and statuary. The public baths of Pompeii were uncovered in 1824 and the complete internal arrangement disclosed, which is probably similar to, though on a smaller scale than, those in Rome. The process of bathing was this: After undressing in the *apodyterium*, or "room for undressing," the bather was rubbed and anointed with some of the fragrant oils and ointments used by the ancients, and then proceeded to a spacious apartment devoted to exercises of various kinds, among which games at ball held a prominent place. After exercise, he went into the *caldarium*, either merely to sweat or to take the hot bath; and during this part of the

process the body was scraped with *strigiles* (small curved instruments usually made of bronze). Being now dried with cloths, and slightly anointed all over with perfumed oils, he resumed his dress, and then passed a short time, successively, in the *tepidarium* and the *frigidarium*, or temperate and cold rooms, which softened the transition from the great heat of the *caldarium* into the open air. The artificial bath has been used from the most ancient times of which we have any record. It is mentioned in Homer, the vessel for bathing being described as of polished marble and the warm baths referred to as effeminate. Public baths were common in Greece during the historic period, and they were in use at Rome from early times; but during the Republic they continued small, dark, and inconvenient, and it was not until the time of the Empire that they reached their great size and splendor.

Russia, Religion of.—The Established Church of Russia, to which the great majority of the inhabitants belong, is identical in doctrine with, and is a branch of, the Greek Church. The liturgy used is the same as that originally used by the Church at Constantinople, but it is read, not in Greek, but in the Slavonic tongue. Previous to the time of Alexander II., dissent in all its forms was not only discouraged but often rigorously repressed and it has only been during very late years that general toleration has been permitted. The Roman Catholic Church has been the object of especial severity in the past, particularly

during the reign of the Czar Nicholas. Under the laws of Alexander II., all Catholics and Protestants enjoy civil rights with members of the Established Church, and are equally admissible to the highest offices of the empire. Christianity was introduced into Russia in the ninth century.

Taj Mahal was built by the Shah Jihan of India as a mausoleum for the remains of his wife Nourmahal, and is situated at Agra. It is of white marble, 100 feet in diameter and 200 feet in height, built in the form of an irregular octagon, and rising from a marble terrace, under which is a second terrace of red sandstone. At the corners of the marble terrace are lofty minarets, and in the center of the main building rises a dome, flanked by cupolas of similar form. Every part, even the basement, the dome, and the upper galleries of the minarets, is inlaid with ornamental designs in marble of different colors, principally of pale brown and bluish violet. Here and there, also, the exterior and interior are decorated with mosaics of precious stones. The whole Koran is said to be written in mosaics of precious stones on the interior walls. In the construction of this magnificent building, which, as Bayard Taylor says, alone repays a visit to India, 20,000 men were employed twenty years. Although the labor cost nothing, over \$20,000,000 were expended in its construction. The doors are of solid silver, and an enormous diamond was placed upon the tomb itself.

SUNDAY-SCHOOL STATISTICS OF ALL COUNTRIES.

The following statistics of Sunday schools were reported at the World's Third Sunday-School Convention, held in London July 11 to 16, 1898, and are the latest extant:

| COUNTRIES. | Sunday Schools. | Teachers. | Scholars. | COUNTRIES. | Sunday Schools. | Teachers. | Scholars. |

The total number of teachers and scholars in the world, according to this report, was 24,919,313.

The table does not include the schools of the Roman Catholic and Non-Evangelical Protestant churches. The number of scholars in Roman Catholic Sunday schools in the United States is estimated by clerics at 900,000. The World's 4th Sunday-School Convention held in Jerusalem April, 1904.

RELIGIOUS STATISTICS.

NUMBERS IN THE WORLD ACCORDING TO CREED.

The following estimates, by M. Fournier de Flaix, are the latest that have been made by a competent authority.

| CREEDS. | No. of Followers. | CREEDS. | No. of Followers. |

The distinction between followers and actual communicants should be observed.

ENGLISH-SPEAKING RELIGIOUS COMMUNITIES OF THE WORLD.

| | | | |
|--|------------|----------------------------------|-------------|
| Episcopallans..... | 29,200,000 | Lutherans, etc..... | 2,800,000 |
| Methodists of all descriptions..... | 18,650,000 | Unitarians..... | 2,600,000 |
| Roman Catholics..... | 15,500,000 | Minor religious sects..... | 5,500,000 |
| Presbyterians of all descriptions..... | 12,250,000 | Of no particular religion..... | 17,000,000 |
| Baptists of all descriptions..... | 9,230,000 | | |
| Congregationalists..... | 6,150,000 | English-speaking population..... | 124,150,000 |
| Free Thinkers..... | 5,250,000 | | |

A very large number—more than 18,000,000—of Hindoos, Mohammedans, Buddhists, and others in the East also speak and read English.

The estimates in the last table are from Whitaker's (London) Almanack, 1896.

The *Encyclopædia Britannica*, last edition, makes a rough estimate of numbers of Protestants in the world speaking all civilized languages, and places the Lutherans at the head, with over 42,000,000 members (mostly in Germany and Scandinavia), and the Anglican Church second, with about 30,000,000 members.

* United States census of 1890.

RELIGIOUS DENOMINATIONS IN THE UNITED STATES.

The following figures were compiled by *The Independent* for 1901, aggregating 28,000,000. The increase for 1902 is 90,630, or a total membership of 28,090,630. The membership of the various denominations has varied but slightly.

* Swedenborgians. † Mormons. ‡ Seceding Mormons.

The aggregate of about 28,000,000 represents actual church membership, and includes all Catholics, but not all persons affiliated by family ties to Protestant bodies. The larger of the Protestant bodies may claim twice the number of their communicants as nominal adherents.

Scriptural Measures of Capacity.—The measures of capacity referred to in the Scriptures, with their English equivalents, are as follows: The Chomer or Homer in King James's translation was 75,625 gals. liquid, and 82,125 pecks dry. The Ephah or Bath was 7 gals. 4 pts., 15 ins. sol. The Seah=1-3 of Ephah, 2 gals. 4 pts., 3 ins. sol. The Hin=1-6 of Ephah, 1 gal., 2 pts., 1 in. sol. The Omer=1-10 of Ephah, 5 pts., 0.5 in. sol. The Cab=1-18 of Ephah, 3 pts., 10 ins. sol. The Log=7 1-72 of Ephah, ½ pt., 10 ins. sol. The Metretes of Syria (John ii, 6)=Cong. Rom. 7½ pts. The Cotyla Eastern=1-

100 of Ephah, $\frac{1}{2}$ pt., 3 ins. sol. This Cotyla contains just 10 oza. avoirdupois of rain water; Omer, 100; Ephah, 1,000; Chomer or Homer, 10,000.

Scriptural Measures of Length.—

The measures of length used in the Scriptures, with their English equivalents, are as follows: The great Cubit was 21.888 ins.=1.824 ft., and the less 18 ins. A span, the longer= $\frac{1}{2}$ a cubit=10.944 ins.=.912 ft. A span, the less = $\frac{1}{3}$ of a cubit=7.296 ins.=.608 ft. A hand's breadth=1-6 of a cubit=3.684 ins.=.304 ft. A finger's breadth=1-24 of a cubit=.912 ins.=.076 ft. A fathom=4 cubits=7.296 ft. Ezekiel's Reed=6 cubits=10.944 feet. The mile=4,000 cubits=7,296 ft. The Stadium, 1-10 of their mile=400 cubits=729.6 ft. The Parasang, 3 of their miles=12,000 cubits, or 4 English miles and 580 ft. 33.164 miles was a day's journey—some say 24 miles; and 3,500 ft. a Sabbath day's journey; some authorities say 3,648 ft.

Theosophy.—The name "theosophy" is from the Greek word *theosophia*, divine wisdom. The object of theosophical study is professedly to understand the nature of divine things. It differs from both philosophy and theology in that all reasoning processes are excluded as imperfect, and claims to derive its knowledge from direct communication with God. It does not accept the truths of recorded revelation as immutable, but as subject to modification by later direct and personal revelations. It is really but another name for mysticism, although the latter name implies much more; and the direct and immediate knowledge or intuition of God to which the Mystics laid claim was, in fact, the foundation of that intimate union with God, and consequent abstraction from outer things, which they make the basis of their moral and ascetical system. The theosophic system dates from a very high antiquity. Since the Christian era we may class among theosophists such sects as Neoplatonists, the Hesychasts of the Greek Church, and in later times the disciples of Paracelsus, Thalhauser, Böhme, and Swedenborg.

Bayeux Tapestry. The, is a web of canvas or linen cloth upon which is embroidered, in woolen threads of various colors, a representation of the invasion and conquest of England by the Normans. The canvas is 214 feet long by 20 inches broad, and is preserved in the public library at Bayeux. Tradition asserts that it is the work of Matilda, wife of William the Conqueror, and it is believed that if she did not actually stitch the whole of it with her own hands, she at least took part in it, and directed the execution of it by her maids, and afterwards presented it to the Cathedral of

Bayeux as a token of her appreciation of the effective assistance which its bishop, Odo, rendered her husband at the battle of Hastings. Some antiquarians contend that it was not the work of Queen Matilda (the wife of the Conqueror), who died in 1083, but of the Empress Matilda (the daughter of Henry I.), who died in 1167. The tapestry contains, beside the figures of 505 quadrupeds, birds, sphinxes, etc., the figures of 623 men, 202 horses, 55 dogs, 37 buildings, 41 ships and boats, and 49 trees—in all, 1,512 figures. It is divided into 72 distinct compartments, each representing one particular historical occurrence, and bearing an explanatory Latin inscription. A tree is usually chosen to divide the principal events from each other. This pictorial history—for so it may be called—gives an exact and minute portraiture of the manners and customs of the times; and it has been remarked that the arms and habits of the Normans are identical with those of the Danes as they appear in the earlier formative periods of the English people.

Amen is a Hebrew word signifying "Yes," "Truly." In Jewish synagogues the amen is pronounced by the congregation at the conclusion of the benediction. Among the early Christians the prayer offered by the presbyter was concluded by the word amen, uttered by the congregation. Justin Martyr is the earliest of the fathers who alludes to the use of the response. According to Tertullian, none but the faithful were permitted to join in the response. A somewhat noisy and irreverent practice prevailed in the celebration of the Lord's Supper until the sixth century, after which it was discontinued. "Upon the reception both of the bread and of the wine, each person uttered a loud 'amen,' and at the close of the consecration by the priest, all joined in shouting a loud 'amen.'" The same custom was observed at baptism, when the sponsors and witnesses responded vehemently. In the Greek Church the amen was pronounced after the name of each person of the Trinity; and at the close of the baptismal formula the people responded. At the conclusion of prayer it signifies (according to the English Church Catechism) *so be it*; after the repetition of the creed, *so it is*.

Shintuism is the prevailing religion of Japan. Its characteristics are the absence of an ethical and doctrinal code, of idol worship, of priestcraft, and of any teachings concerning a future state. It requires pre-eminently purity of heart and general temperance. The principal divinity is the sun-goddess Amaterasu, whose descendant and vice-regent on earth is the Mikado, who is therefore wor-

shipped as a demigod. Their temples are singularly devoid of ecclesiastical paraphernalia. A metal mirror generally stands on the altar as a symbol of purity. The spirit of the enshrined deity is supposed to be in a case, which is exposed to view only on the day of the deity's annual festival. The worship consists merely in washing the face in a font, striking a bell, throwing a few cash into the money box, and praying silently for a few seconds. In addition to the chief deity, there are a legion of canonized heroes and benefactors who are worshipped. Many Japanese temples are magnificent specimens of architecture in wood, and are remarkable for their vast tent-like roofs and their exquisite wood-carving.

Arundel Marbles are a collection of ancient sculptures consisting of 37 statues, 128 busts, and 250 inscribed stones, which were found on the island of Paros about 1610. They were collected by Mr. W. Pefty, purchased by Lord Arundel, and given by his grandson, Henry Howard—afterward Duke of Norfolk—to the University of Oxford in 1667. These sculptures contain inscriptions in the Greek tongue. In their perfect state they evidently contained a chronological table of the principal events of Grecian history from the time of Cecrops, 1582 B. C., to the archonship of Diognetus, 264 B. C. The chronicle of the last ninety years of this period, however, is lost, and the portion still extant is much corroded and defaced.

Babel, Tower of.—The distinction of being a remnant of the Tower of Babel has been claimed for three different masses, but the majority of opinions are in favor of the Birs Nimrud in Babylonia, the ruins of this temple appearing to more nearly correspond with the conceived notion of that structure. It is of an oblong form, the total circumference being 762 yards. At the eastern side it is cloven by a deep furrow, and it is not more than 50 or 60 feet high; but on the western side it rises in a conical figure to the elevation of 198 feet; and on its summit is a solid pile of brick 37 feet high by 28 in breadth, diminishing in thickness to the top, which is broken and irregular, and rent by a large fissure extending through a third of its height. The fire-burnt bricks of which it is built have inscriptions on them; and so excellent is the cement, which appears to be lime-mortar, that it is nearly impossible to extract a whole brick. The other parts of the summit of the hill are occupied by immense fragments of brickwork of no determinate figure, tumbled together, and converted into solid, vitrified masses, as if they had undergone the action of the fiercest

fire or had been blown up with gunpowder. These ruins stand on a prodigious mound, the whole of which is itself in ruins, channeled by the weather, and strewed with fragments of black stone, sandstone, and marble. Taken in connection with the ancient tradition that the Tower of Babel was rent and overthrown by fire from heaven, this is a curious circumstance.

Sunday.—The name of the first day of the week is derived from the Saxon *Sunnan daeg*, or day of the sun; in the Roman calendar, *dies Solis*. We have no definite information as to when the observance of the first day of the week was substituted by the Christians for that of the seventh day, the ancient Jewish Sabbath. It undoubtedly arose among the earliest practices of the Christian Church, and was regarded as the fittest day to be held as sacred, because, in the words of one of the Fathers, "It is the first day in which God changed darkness and matter, and made the world; and on the same day, also, Jesus Christ, our Saviour, rose from the dead." Various additional reasons, taken from the Old Testament, were advanced by others of the early Fathers in support of the observance of this day. The first law, either ecclesiastical or civil, by which the sabbatical observance of Sunday is known to have been ordained, is an edict of Constantine, A. D. 321, forbidding all work but necessary husbandry on the "venerable Sunday." In the Theodosian Code it is enjoined that "on the Sunday, rightfully designated by our ancestors as the Lord's Day, all lawsuits and public business shall cease." Since the ninth century, Sunday has been a thoroughly established institution of the Christian Church as a day of rest and religious exercises, and one exempt from any occupations of a purely secular character, except such as were absolutely necessary.

Peri.—According to the mythical lore of the East, a Peri is a being begotten by fallen spirits, which spends its life in all imaginary delights; it is immortal, but is forever excluded from the joys of Paradise. They take an intermediate place between angels and demons, and are either male or female; when the latter, they are of surpassing beauty. One of the finest compliments to be paid to a Persian lady is to speak of her as Perizadeh (born of a Peri; Greek, *Parisatis*). They belong to the great family of genii, or jin, a belief in whom is enjoined in the Koran, and for whose conversion, as well as for that of man, Mohammed was sent.

Peter-Pence, the name given to a tribute offered to the Roman pontiff in reverence to the memory of St. Peter, whose successor the

pope is believed by Roman Catholics to be. The first idea of an annual tribute appears to have come from England. It is ascribed by some to Ina (A. D. 721), King of the West Saxons, who went as a pilgrim to Rome, and there founded a *hospice* for Anglo-Saxon pilgrims, to be maintained by an annual contribution from England; by others, to Offa and Ethelwulf, at least in the sense of their having extended it to the entire Saxon territory. The tribute consisted in the payment of a silver penny by every family possessing land or cattle of the yearly value of thirty pence, and it was collected during the five weeks between St. Peter's and St. Paul's day, and August 1. Since the total annexation of the Papal states to the kingdom of Italy the tribute has been largely increased in France, Belgium, England, and Ireland.

Public Schools.—The origin of the public school system of America dates back to the time of the settlement of Massachusetts and Connecticut. In the very beginning of their history these colonists made provision for the establishment of schools in every town, and parents were required to send their children to them or educate them otherwise. At first these schools were not entirely free; that is, those who could pay were required to do so; but the evil of separating the children into paupers and rate-payers in time became apparent, and shortly after the colonies became states the school taxes were increased and the schools were made free. The example of these colonists was quickly followed by other New England colonies; but in other sections of the country schools were either private or parochial for many years, except in cases where a free school was established and supported by private beneficence. When the vast territories west of the Allegheny mountains came into the possession of the United States, every sixteenth section in each Congressional township was set aside by the government as a nucleus of a public school fund; later, this was increased to two sections for the benefit of the newer states. The Southern states were the last to embrace the free school system in its entirety, having done so only since the close of the civil war. Maine, Vermont, Massachusetts, Connecticut, New Hampshire, New York, New Jersey, Kansas, Nevada, Wisconsin, Ohio, Michigan, California, Arizona, Wyoming, and Washington Territory have compulsory educational laws. The average age up to which school attendance is required is, in the United States, fourteen and one half years, which is older than that in any other country.

Colossus of Memnon.—The celebrated

vocal statue of Memnon, on the plain of Thebes, was originally sixty feet high, and is of a coarse, hard gritstone or breccia. The peculiar characteristic of this statue was its giving out at various times a sound resembling the breaking of a harp string or a metallic ring. Considerable difference of opinion has prevailed as to the reason of this sound, which has been heard in modern times, it being ascribed to the artifice of the priests, who struck the sonorous stone of which the statue is composed, the passage of light draughts of air through the cracks, or the sudden expansion of aqueous particles under the influence of the sun's rays. This remarkable quality of the statue is first mentioned by Strabo, who visited it in company with Ælius Gallus, about 18 B. C.; and upwards of 100 inscriptions of Greek and Roman visitors, incised upon its legs, record the visits of ancient travelers to witness the phenomenon, from the ninth year of Nero, A. D. 63, to the reign of the Emperor Severus, when it became silent.

Colossus of Rhodes.—The gigantic Colossus of Rhodes was a statue of Apollo, so placed as to bestride the entrance to the harbor. It is said to have been commenced by Chares of Lindus, a famous pupil of Lysippus, and was completed by Laches. It was formed of metal which was cast in separate pieces, a process which lasted for twelve years, and was finished in 280 B. C. The Colossus was over 100 feet high, and its thumb was so large that a man could not clasp it with his arms. It cost 300 talents, and sixty years after its erection it was thrown down by an earthquake. When, after lying on the ground for centuries, it was removed, the metal that composed it loaded 900 camels. The Colossus of Rhodes ranks as one of the Seven Wonders of the World.

Sanhedrim, as the supreme national tribunal of the Jews was called, was established at the time of the Maccabees, and was the court before which Christ was tried for high treason against the Roman Emperor. It was presided over by the Nasi (Prince), at whose side was the Ab-Beth-Din (Father of the Tribunal). Its members, of which there were seventy-one, belonged to the different classes of society; there were priests, elders—that is, men of age and experience—scribes, or doctors of law, and others exalted by eminent learning, which was the sole condition for admission. The limits of its jurisdiction are not clearly known, but it is believed that the supreme decision over life or death was exclusively in its hands. The regulation of the sacred times and seasons was vested in it. It fixed the beginnings of the new moons; in-

tercalated the years when necessary; watched over the purity of the priestly families by carefully examining the pedigrees of those priests born out of Palestine, so that none born from a suspicious or ill-famed mother should be admitted to the sacred service. The mode of procedure was extremely complicated; and such was the caution of the court, especially in matters of life and death, that capital punishment was pronounced in the rarest instances only. The Nasi had the supreme direction of the court, and convoked it when necessary. He sat at the head, and at his right hand was the seat of the Ab-Beth-Din; the rest of the seventy-one took their places, according to their dignity, in front of them, in the form of a semicircle, so that they could be seen by both the chief officers. The meeting place of the court was, on ordinary occasions, in a hall at the southeast corner of the Temple, but on extraordinary occasions it met in the house of the high priest. It met daily, with the exception of Sabbaths and feast days. After the destruction of the Temple and Jerusalem, the Sanhedrim, after many emigrations, was finally established at Babylon.

Host.—In conformity with the doctrines of the Roman Catholic Church, the consecrated bread of Eucharist is called the Host. In the Latin Church it is a thin circular disk of unleavened bread, made of the finest flour, and generally bearing some emblematic device. In the Greek and other Oriental churches, as well as in the various Protestant communities, the Eucharist is celebrated in leavened bread, only differing from ordinary bread in being of finer quality.

Schoolmen and Scholastics are the terms applied to the class of learned theologians and philosophers who flourished in Europe, mainly in France and England, during the middle ages. They were largely given to hair-splitting logic and endless argumentations and speculations on points of the most unimportant and often silly nature. Still, in their number were included men of great learning and ability, as Duns Scotus, Thomas Aquinas, and Albertus Magnus, with whom this system of philosophical theological scholasticism culminated in the fourteenth century. Johannes Erigena Scotus was not strictly a scholastic; he lived in the ninth century, in the preparatory period of scholasticism.

Colosseum, The.—The Flavian amphitheater at Rome, known as the Colosseum, was begun by the Emperor Vespasian, and was finished by the Emperor Titus, A. D. 80. It covers about five acres of ground, and contained seats for 87,000 persons and standing room for

15,000 more. It was in the form of an oval, the longer diameter being 612 feet and the shorter diameter 515 feet, and the height of the walls from 160 to 180 feet. The arena where the gladiators fought and the deadly conflicts with wild beasts took place was 281 by 178 feet. The exterior consists of three rows of columns, Doric, Ionic, and Corinthian, and above, a row of Corinthian pilasters. Between the columns there are arches which form open galleries throughout the whole building, and between each alternate pilaster of the upper tier there is a window. There were four tiers or stories of seats, corresponding to the four external stories. The first of these is supposed to have contained twenty-four rows of seats, and the second sixteen. These were separated by a lofty wall from the third story, which is supposed to have contained the populace. Statues, sculptures, figures of chariots, metal shields, and other embellishments adorned the niches and salient points. On the occasion of the dedication of the Colosseum by Titus, 5,000 wild beasts were slain in the arena, the games having lasted for nearly 100 days. There were means by which, when the combats were ended, the immense arena could be filled with water for the exhibition of sea-fights. During the various persecutions of the early Christians many of these were thrown to the wild beasts in this amphitheater. One of the first of these was St. Ignatius, who was torn to pieces by lions. In the sixth century, when Christianity gained the ascendancy, the Church put an end to the use of the Colosseum. It still stood entire in the eighth century, but subsequently large quantities of the marble was used in the construction of public and private buildings. It was consecrated as a monument to the martyrs who had suffered within its walls by Pope Benedict XIV., who erected crosses and oratorios within it, and so put an end to the process of destruction.

Parsees, the followers of the ancient Persian religion as reformed by Zerdusht, or Zoroaster, as he is commonly called. According to Zerdusht there are two intellects, as there are two lives—one mental and one bodily; and, again, there must be distinguished an earthly and a future life. There are two abodes for the departed—Heaven and Hell. Between the two there is the Bridge of the Gatherer, or Judge, which the souls of the pious alone can pass. There will be a general resurrection, which is to precede the last judgment, to foretell which Sosiosh, the son of Zerdusht, spiritually begotten, will be sent by Ahuramazdao. The world, which by that time will be utterly steeped in wretchedness, darkness, and sin, will then be renewed. Death,

the arch fiend of Creation, will be slain, and life will be everlasting and holy. The Parsees do not eat anything cooked by a person of another religion. Marriages can only be contracted with persons of their own caste and creed. Their dead are not buried, but exposed on an iron grating in the Dokhma, or Tower of Silence, to the fowls of the air, to the dew and to the sun, until the flesh has disappeared, and the bleaching bones fall through into a pit beneath, from which they are afterward removed to a subterranean cavern. The temples and altars must forever be fed with the holy fire, brought down, according to tradition, from heaven, and the sully of whose flame is punishable with death. The priests themselves approach it only with a half-mask over their faces, lest their breath should defile it, and never touch it with their hands, but with holy instruments. The fires are of five kinds; but, however great the awe felt by Parsees with respect to fire and light, they never consider these as anything but emblems of Divinity. There are also five kinds of "sacrifice," which term, however, is rather to be understood in the sense of a sacred action.

Koran, the sacred book of the Mohammedan religion. According to that belief a copy of it, in a book bound in white silk, jewels, and gold, was brought down to the lowest heaven by the angel Gabriel, in the blissful and mysterious night of Al-Khadr, in the month of Ramadan. Portions of it were, during a space of twenty-three years, communicated to Mohammed, both at Mecca and Medina, either by Gabriel in human shape, "with the sound of bells," or through inspirations from the Holy Ghost "in the Prophet's breast," or by God himself, "veiled and unveiled, in waking or in the dreams of night." Mohammed dictated his inspirations to a scribe, not, indeed, in broken verses, but in finished chapters, and from this copy the followers of the Prophet procured other copies. The chief doctrine laid down in the Koran is the unity of God and the existence of one true religion with changeable ceremonies. When mankind turned from it at different times, God sent prophets to lead them back to truth; Moses, Christ, and Mohammed being the most distinguished. Both punishments for the sinner and rewards for the pious are depicted with great diffuseness, and exemplified chiefly by stories taken from the Bible, the Apocryphal writings, and the Midrash. Special laws and directions, admonitions to moral and divine virtues, more particularly to a complete and unconditional resignation to God's will, legends principally relating to the patriarchs, and almost without exception borrowed from the Jewish writings,

form the bulk of the book, which throughout bears the most palpable traces of Jewish influence. The outward reverence in which the Koran is held throughout Mohammedanism is exceedingly great. It is never held below the girdle, never touched without previous purification; and an injunction to that effect is generally found on the cover. It is consulted on weighty matters; sentences from it are inscribed on banners, doors, etc. Great lavishment is also displayed upon the material and the binding of the sacred volume. The copies for the wealthy are sometimes written in gold, and the covers blaze with gold and precious stones. Nothing, also, is more hateful in the eyes of a Moslem than to see the book in the hands of an unbeliever.

Palace of the Cæsars.—The palace of Augustus, built upon the site of the houses of Cicero and Catiline, was the beginning of the magnificent pile of buildings known as the Palace of the Cæsars, and each succeeding Emperor altered and improved it. Tiberius enlarged it, and Caligula brought it down to the verge of the Forum, connecting it with the Temple of Castor and Pollux, which he converted into a vestibule for the imperial abode. Nero added to it his "Golden House," which extended from the Palatine to the Cælian Hill, and even reached as far as the Esquiline. This latter portion was afterward used by Titus for his famous baths. The ruins of the palace extend over the three hills of Rome, and cover an area of 1,500 feet in length and 1,300 feet in width. The Golden House, as can be imagined from its name, was a building of extraordinary magnificence. It was surrounded by a triple portico a mile in length, and supported by a thousand columns; and within this lay an immense lake, whose banks were bordered by great buildings, each representing a little city, about which lay green pastures and groves, where sported "all animals, both tame and wild." The ceilings of the banquetting rooms were fretted into ivory coffers made to turn, that flowers might be showered down upon the guests, and also furnished with pipes for discharging perfumes. The principal banquetting room was round, and by a perpetual motion, day and night, was made to revolve after the manner of the universe. The interior walls of the palace were covered with gold and precious stones, and adorned with the finest paintings that the world afforded. In the vestibule stood a statue of Nero, 120 feet in height.

Chinese Burial Customs.—Immediately upon the decease of a person in China a priest is called, whose prayers are supposed to free the departed spirit from the necessity of

going to hell, and to secure his admittance to Paradise. The body is arrayed in the most splendid garments that the family can afford. In one hand is placed a fan, and in the other a prayer written on a piece of paper, which is a letter of recommendation to open the gates of Heaven. The coffin is a very solid, substantial case. The corpse when put in it, is laid in a bed of lime or cotton, or covered with quicklime, and the edges of the lid are closed with mortar in the groove, so that no smell escapes. The nature of the site for burial is regarded as having an important influence on the prosperity of the living, the people fearing ill luck, disease, and accident if the dead are not satisfied with the site of their graves. The selection of propitious sites is made by geomancers, a class of quacks who pretend to supernatural wisdom. When the day of burial arrives, which is—if a satisfactory place for the tomb has been found—the nearest lucky day to the third seventh day after death, the friends assemble at the house. An offering of cooked provisions is laid out near the coffin. This is intended to occupy the attention of the spirit of the dead, which is supposed to linger near the body, or any other vagrant spirits that may be hovering around, and keep them from doing any mischief or harm to the living. All mourners are dressed entirely in white, and they assemble about the coffin and in turn prostrate themselves before it, a band of music playing meanwhile. The procession is then formed, the coffin going first, borne on an unwieldy bier carried by sixty-four men, or even more. A man goes before the procession and scatters paper money, to buy the good will of any stray, tricky spirits that may be prowling about. Immediately after the coffin, in a separate sedan, is borne the ancestral tablet of the deceased with the offering of food. Different figures, banners, and tablets are also carried, according to the means and rank of the family. When the grave is reached the coffin is let down, and lime is abundantly mixed with the earth thrown in upon it. Crackers are then fired, libations are poured out, prayers are recited, and finally paper molds of houses, clothes, horses, money, and everything that the dead man can possibly want in the land of shadows, are burned. The origin of this latter custom is unquestionably the idea that everything that had been enjoyed or used in this life would be desired in the other. The ancient custom was to burn a man's household belongings, to kill upon his grave his favorite horse, hound, or bird, and sometimes his chosen servant, that their shadows might go with him into the life beyond. After the funeral the elaborate dishes that have been borne to the grave are carried

back, and the mourners feast upon them. Bodies are in some instances kept in or about the house for many years, and incense is burned before them morning and evening.

Delphi, Temple at.—The edifice known to have existed at Delphi, Greece, at the beginning of the historic period, is said to have been the work of two architects named Trophonus and Agamedes. In 548 B. C., this temple having been destroyed, the Amphictyons undertook to build another for the sum of three hundred talents, of which the Delphians were to pay one fourth, and the remainder was to be contributed by other cities of Greece. The temple is said to have been of the Doric order without, and the Ionic within. The front was built of Parian marble, and the sculptured decorations were rich and beautiful. The arches above the entrances were adorned with representations of legends of mythology, and similar adornments were carved on the panels of the walls. Images and statues in brass and marble enriched the interior, and the golden shields taken at Marathon, and also in battles with the Gauls, adorned the architraves. The attempts of the Persians, in 480 B. C., and of the Gauls, in 279 B. C., to rob the temple, were both, it was said, prevented by the miraculous interference of Apollo, and the sacred character of the place long protected it from other would-be plunderers. It was, however, eventually plundered by Sulla, and again by Nero, who silenced the oracle. It was restored by Hadrian, and then despoiled of many of its most beautiful works of art by Constantine the Great, and finally destroyed in the latter part of the fourth century.

Sinai.—The exact position of Sinai, the mount on which God gave to Moses the Ten Commandments and the other laws by which the Israelites were bound, is a matter of some dispute, but it is probably to be found in the mountains occupying the greater part of the Arabian peninsula, lying between the Gulf of Suez and Akabah. This mountain mass is divisible into three groups—a northwestern, reaching, in Mount Serbel, an elevation of 6,340 feet; an eastern and central, attaining in Jebel Katherin a height of 8,160 feet, and a southeastern, whose highest peak, Um Shaumer, is the culminating point of the whole Sinaitic range. Serbel, with its five peaks, looks the most magnificent mountain in the peninsula and is identified with Sinai by the early Church Fathers, Eusebius, Jerome, Cosmas, etc.; but the requirements of the Hebrew narrative are not met by it, and even as early as the time of Justinian, the opinion that the Serbel was the Sinai of Moses had been abandoned, and to a ridge of the second or eastern range that honor

had been transferred, the northern summit of which is termed Horeb; and the southern, Jebul-Musa, or Mount of Moses, continues to be regarded by a majority of scholars as the true Sinai. The famous monastery of Mount Sinai stands at the eastern base of Jebul-Musa, in solitary peace. There were numerous other convents, chapels, and hermitages around the mountain in earlier times.

Jesuits, Society of, was founded by Ignatius of Loyola, assisted by Peter Le Fevre, a Savoyard; James Lainez, Francis Xavier, Nicholas Bobadilla, Spaniards, and a Portuguese named Rodriguez, in the year 1534. The society, when first conceived, had for its object a pilgrimage to the Holy Land and the conversion of the infidels. This purpose, however, was abandoned owing to the warfare existing at that time between the Turks and the Western powers, and Loyola and his associates turned their attention to an organization designed to labor zealously in resisting the spread of the Reformation. In 1539 the rule of the proposed order—"To the greater glory of God"—and the vow by which they bound themselves to go as missionaries to any country which the Pope might indicate was submitted to Paul III., and Loyola was made the first general of the order. The Society of Jesuits is one of the most celebrated religious orders of the Roman Catholic Church, and its history has been closely identified at times with that of several of the leading countries of Europe. By reason of legislative influences the Jesuits were obliged to suspend operations in France, Italy, Spain, and several other countries. Notwithstanding that many good Roman Catholics are not in sympathy with the Jesuit order, yet it can be said that in their pioneer missionary operations they undoubtedly accomplished a great deal of good.

Mosaics.—The origin of the art of producing artistic designs by setting small square pieces of stone or glass of different colors, so as to give the effect of painting, is obscure, but it was much practiced by the Romans, especially for ornamental pavements, specimens of which are almost always found wherever the remains of an old Roman villa are discovered. Under the Byzantine empire it was also much used for the ornamentation of churches, in which it formed a large portion of the wall decoration. Christian mosaics admit, says one writer, of two general divisions, the later Roman and the Byzantine styles, the material in use being, in general, cubes of colored glass, inlaid, in the Roman school, on a ground of blue and white, although in the latter the tesserae are frequently irregular in size and the workmanship coarse. The former style flour-

ished in Italy chiefly in the fifth and sixth centuries, the most splendid specimens being found in the churches of Rome and Ravenna. The Florentine mosaic dates from the time of the Medici, and is made entirely of precious or semi-precious stones, such as amethyst, agate, jasper, onyx, and others, cut and inlaid in forms or thin veneers best suited to produce the effects desired. The objects represented are most frequently birds, flowers, fruits, vases, sometimes buildings, and, more rarely, portraits and landscapes. In reference to the present Roman mosaics, it may be said that the small or small cubes of colored glass which compose the pictures are stuck into the cementing paste, or mastic, in the same manner as were the colored glass, stone, and marble tesserae and tesserae of the ancients. Within quite recent years mosaics of surpassing beauty, both in design and material, have been produced by Russian artists in the Imperial Glass Manufactory of Russia.

Trajan's Column, a celebrated column at Rome, which was reared A. D. 114, by the Roman Senate and people, in honor of the Emperor Trajan. It is considered not only the greatest work of its architect, Apollodorus, but one of the noblest structures of its kind ever erected. The pedestal is covered with bas-reliefs of warlike instruments, shields, and helmets; and a very remarkable series of bas-reliefs, forming a spiral around the shaft, exhibits a continuous history of the military achievements of Trajan. These are in excellent preservation, and, independently of their beauty as works of art, they are invaluable as records of ancient costumes. A spiral staircase in the interior of the column leads to its summit. The height of the entire column is 132 feet. It stands erect in all its ancient beauty amid the ruins of Trajan's Forum. The summit was originally crowned by a colossal statue of the emperor, which has been incongruously replaced by one of St. Peter.

Vulgate, The, the Latin translation of the Bible, which is the received version in the Roman Catholic Church. The original Vulgate was completed in A. D. 405 by Jerome, and between that date and 1546, when it was first declared the authorized version of the Roman Church, it underwent several revisions which completely changed the character of the work. In the latter year the Tridentine Council decreed the preparation of an authentic edition, and the task was undertaken by the Papal Chair; but it was not until 1590 that Sixtus V. produced the work. This, however, turned out to be so utterly incorrect and faulty throughout that the copies were speedily suppressed, and another edition, which appeared

in 1592, was prepared under Clement VIII., to which, in the next year (1593), that other edition succeeded, which has since remained the normal edition of the Church of Rome, and has been reprinted, unchanged, ever since.

The Smithsonian Institution is situated in Washington, D. C., and was organized by act of Congress in August, 1846, to carry into effect the provisions of the will of James Smithson. That celebrated English physician bequeathed to his nephew £120,000, the whole of his property, which, in the event of the death of the latter without heirs, was to revert to the United States, to found at Washington an establishment for "the increase and diffusion of knowledge among men," and which was to be named the Smithsonian Institution. The conditions on which the bequest was to take effect in the United States occurred in 1835 by the death of the nephew without issue, and the Hon. Richard Rush was sent to London to prosecute the claim. On September 1, 1838, he deposited in the United States Mint \$515,169, being the proceeds of the estate. The Institute is governed by regents appointed by the federal government, and contains a museum, library, cabinets of natural history, and lecture rooms. It receives copies of all copyrighted books, and exchanges with other countries, and its museum is enriched with the gatherings of national exploring expeditions. A portion of its funds is devoted to scientific researches and the publication of works too expensive for private enterprise. There are departments of astronomy, ethnology, meteorology, and terrestrial magnetism. The courses of public lectures by eminent scientific men are among the attractions of the capital.

REQUIREMENTS FOR THE PRACTICE OF LAW.

Qualifications as to citizenship, personal character, education, and professional attainments required by the several states, from those who are admitted to the practice of law.

From reports to the United States Bureau of Education.

Alabama. Actual, *bona fide* citizenship. High moral character as testified to by a member of the profession. Education judged from examination. If the study period is passed in a law office, then the judges of the supreme court must make written examination, except in the case of those graduating from Alabama University.

Arkansas. Must be a citizen of the state and of good moral character. The liberal education feature is left to court which examines. The circuit and supreme courts are the only bodies authorized to grant license to practice law. Applicant must stand satisfactory examination in open court, by the supreme court, and by a committee of three lawyers appointed by circuit court when applicant is examined by that court.

Arizona. A declaration of citizenship and proof of good moral character are required, but there is no dis-

tinction between liberal and professional education. The only thing necessary for admission to practice here, if not armed either with a diploma or license from another jurisdiction, is to stand the examination in open court, and by that show such familiarity with the law as will satisfy the court that the applicant is qualified to take care of a practice.

California. A declaration of citizenship and certificate from two attorneys of court to which applicant has applied for admission that he possesses the character and attainments that entitle him to admission. Examination in open court after filing certificate from two attorneys.

Colorado. Must declare intention to become a citizen three months before applying; must have certificate of good moral character; but no special attention paid to liberal education feature. If not a member of the bar of another state, must pass an examination before supreme court or a committee appointed by it in each judicial district.

Connecticut. Must be a citizen of the United States, 21 years old, and be of good moral character, and must have graduated from a college or secondary school or have been admitted to a college or preparatory school, or passed an examination before committee, for which last he must pay a fee of \$5.00. Must have studied law after arriving at the age of 18 for two years, if a college or law school graduate; otherwise, for three years in a law school or under competent professional instruction in the office of a practicing attorney or with the judge of the superior court or both, of which period one year, at least, must be spent in this state. Applicants shall be required to pass a satisfactory examination, before a standing committee of fifteen, upon the law of pleading, practice, and evidence, constitutional law, the law of real and personal property, contracts, torts, equity, criminal law, wills, and administration, corporations, partnership, negotiable paper, agency, bailments, domestic relations, and such additional subjects as committee shall deem advisable.

Delaware. Must be a resident of the state and of "fair" character, and must have a general knowledge of English and American history, mathematics, English grammar, and Latin. A legal course in a law office is not necessary. All applicants for admission except practicing lawyers of other states are required to study three years under direction of a lawyer or a judge of the state. Examination is made by a committee of the bar.

Florida. Must satisfy judge that he is 21 years of age, and of good moral character. Shall be examined by the judge to whom application is made or a committee of two appointed by judge.

Georgia. Must be a citizen of the circuit wherein he makes application and of good moral character, as shown by a certificate of two attorneys known to court. Must undergo examination before committee appointed by court on common law, pleading, and evidence, equity, and equity pleading and practice. Code of Georgia, United States and State Constitutions, and the rules of court. Diplomas of certain law schools in Georgia will obviate necessity of examining candidate.

Idaho. Must be a citizen of the United States; nothing required in the way of liberal education. He must have a knowledge of the law; it is immaterial how he gets it. A committee appointed by court ascertains fitness.

Illinois. Must make affidavit that he is of age, a citizen of the state, and a certified transcript from a court of record in this state showing that he is a man of good moral character. Nothing required as to liberal education. Every applicant to practice law, except those who apply for admission upon a license granted in another state, or upon a diploma issued by a law school in the state, shall present to one of the appellate courts proof that he has studied law three years, the same studies prescribed by the regularly established law schools in the state, or a course equivalent thereto, naming the books studied, under the direction and supervision of one or more licensed lawyers or firms of lawyers, and that the applicant has submitted to satisfactory examinations by such lawyer or lawyers at convenient intervals during such period of study, covering progressively the entire course studied, such proof to consist of the affidavit of the applicant and also of the certificate or certificates of the lawyer. Examination is held in open court.

Indiana. Every person of good moral character, being a voter, shall be entitled to admission to practice

law in all courts of justice. (Constitution, Art. VII, sec. 21.) From the letter of the attorney-general, Honorable William A. Ketchum: The words, "being a voter" has been held by the courts to have no limitation in excluding those who are not voters, and women are admitted to practice. The only substantial requirement is that the applicant shall be of good moral character, and at times this may not be very rigidly insisted upon. It seems to be the theory that it is not very important who is admitted to practice law, as after he has been admitted to practice if he does not know enough to justify his admission, he will not get any practice anyhow.

Iowa. Must be a citizen (of the state) and of good moral character. There is no provision regarding a liberal education, but the want of it is considered in determining the applicant's qualifications. Must pursue a regular course in the study of law for at least two years in the office of a practicing attorney of this state, or a course of two years of thirty-six weeks each in some reputable law school in the United States. Examination is conducted by three members of the bar, one of whom must be attorney-general. The written questions are prepared by the supreme court; the oral examination is conducted in open court.

Kansas. Any person being a citizen of the United States, who has read law for two years, the last of which must be in the office of a regularly practicing attorney, who shall certify as to the good character and domicile of the applicant, after passing a satisfactory examination before any district court of the state, and taking the prescribed oath, shall be admitted to practice. Graduates of the School of Law of the University of Kansas are admitted to practice in the district and inferior courts without further examination.

Louisiana. Must be citizen of state; present certificate of good moral character. Must present certificate that two years have been spent in study of law. The court will not be satisfied with the qualifications of a candidate in point of legal learning unless it shall appear that he is well read in the following course of studies at least: Constitution (Story), Law of Nations (Vattel or Wheaton), History of the Civil Law in Louisiana, Louisiana Civil Code, Code of Practice, General Statutes, Institutes of Justinian, Domat's Civil Law, Pothier on Obligations, Blackstone's Commentaries (fourth book), Kent's Commentaries, Mercantile Law (Smith), Insurance (Wood), Negotiable Paper (Story, or Parsons and Daniel), Evidence (Greenleaf, Starkie or Phillips), Crimes (Russell), criminal procedure (Bishop), and the Jurisprudence of Louisiana.

Maine. Nothing in the way of citizenship or liberal education, but character must be satisfactory to justice presiding at time of examination. Must have studied law two years in a lawyer's office or law school, and must be vouched for by the member of bar with whom the student has read. The examining committee is composed of three members of the bar in each county.

Maryland. Must have been a citizen two years (of state), and be of good moral character. No liberal education required by law. Must have been a student of law for the two years immediately preceding his application, and must be examined by court, if not a graduate of a law school in state. The court selects the examining committee.

Massachusetts. Must be a citizen of the state, or have declared his intention to become such, and must be of good moral character. Undoubtedly, applicant's command of English, as shown in examination papers, is of weight. Must pass a thorough examination.

Michigan. Must be a resident in the state, a citizen of the United States, and of good moral character (affidavit of at least two members of the bar of the state in good standing). The board of examiners will regard applicants who have received bachelors' degrees from any reputable college or university as having *prima facie* the requisite general educational qualifications for admission to the bar. So also as to graduates of Michigan normal or high schools, or other reputable institutions of similar character. Recent first grade teachers' certificate will also be accepted. Otherwise applicant must pass examination, especially in arithmetic, grammar, elementary algebra, general American and English history, civil government, composition and rhetoric, and English literature. If the professional examination papers of a college or other graduate show deficiencies in education, the writer will be subject to examination. Graduates from law department of Michigan University or Detroit College of Law, both having a three years' course, are admitted to bar on their diploma. Others must have studied law for three years

previous to applying for admission, which shall be conditioned on the applicant's answering correctly seventy per cent. of the questions asked him in a written and oral examination.

Minnesota. Applicant must present his affidavit that he is of age and is a citizen of the United States, or has declared his intention to become such. Also affidavits from two practicing attorneys that he is a person of good moral character. Board shall examine applicants in such branches of general education as it may deem expedient. Must be examined by state board of examiners in law of real property, conveyances and trusts, equity jurisprudence, pleading and practice, common law, statute law, code pleading and practice, constitutional law, international law, criminal law, contracts, sales, bailments and negotiable instruments, landlord and tenant, insurance, partnership, agency, suretyship, frauds, damages and liens, torts, domestic relations, executors, administrators, and wills. Attorneys of five years' standing from any other state or territory of the United States or District of Columbia may, in the discretion of the board, be admitted without examination.

Missouri. Must be an actual resident and of good character. No particular qualification as to liberal education. Graduates of the St. Louis, Kansas City, and Columbia law schools are exempted from examination. Others are required to pass an examination in open court.

Montana. Must be a resident of the United States, or have made a *bona fide* declaration of his intention to become such, and that he is of age; must have testimonials of good moral character, and have studied law for two years, as certified to by two reputable counselors at law. The examination is conducted in open court.

Nebraska. Must be a resident, of age, of good repute, and have studied law for two years. Must at least have a good common school education, which is judged from his composition and spelling at examination. Graduates of the College of Law of the University of Nebraska shall be admitted, as far as professional learning is concerned, without examination. Others are examined by court.

Nevada. Resident of the state and of good moral character. A general education only required. Familiarity with the various branches and general practice of the law required, and to this end study in law office is desirable, although not required. The examination is by court or committee.

New Jersey. Must take the oath of allegiance, be of age, and of good moral character. Must have served a clerkship of four years with some practicing attorney of the state unless he is a graduate of some college or university in the United States, when his clerkship may be acquitted in three years. During the clerkship he must not have been engaged in any other business incompatible with the full and fair *bona fide* service of his clerkship. No person shall be recommended for license as a counselor at law in this state, unless he first submit himself to examination and give satisfactory evidence of his knowledge of the principles and doctrines of the law, and of his abilities as a pleader, nor shall any be admitted to such examination until he shall have practiced as an attorney for three years at least. The examination for attorneys and counselors shall be both written and oral. The examining committee is composed of six counselors, two going out each year.

New Mexico. Must be a citizen of the United States or have declared intention to become such, of good moral character, and *bona fide* resident of New Mexico. Must undergo an examination in open court.

New York. Must be a citizen and present certificate of good moral character. Liberal education is required. For college graduates two years' study of law is required (for others, three years) either in law school or in office. There is a state board of law examiners.

North Carolina. One year residence in the state required, as also a certificate of good moral character, signed by two members of the bar. All must undergo an examination and must have read law in a law office or in a law school for twelve months at least. Supreme court conducts examination.

North Dakota. Must be a resident, of good moral character. All are examined, but applicants must have read law in an office or studied in some reputable law school for two years (thirty-six weeks of session being taken as a year). Supreme court examines applicants.

Ohio. Must be a citizen of the United States or have declared intention, have resided one year in state, and

be a person of good moral character. Nothing in the way of liberal education. All must pass an examination, to which those only are admitted who have studied law three years either in an office or in a law school. Supreme court appoints a committee of nine members to examine applicants.

Oklahoma. Must possess a good moral character. Must have acquired the requisite learning. This fact is ascertained through examination by the court. Applicant is examined in open court by committee.

Pennsylvania. He must be a citizen of the United States and of a good moral character as certified to by two persons. He must have a good English education and a knowledge of the elements of Latin as evidenced by examination. In most counties the rules of court require a two or three years' course of study (prior to final examination, by a committee) in the office of a member of the local bar and require at least one year's actual work in an office, even for students of regular law schools.

South Carolina. Citizenship required. Must be of age and of a good moral character. Graduates at the law school of the State University are admitted without examination; others must undergo the examination upon the course of study prescribed by supreme court.

South Dakota. Must be a resident of the state, of age, and of good moral character. All are required to pass an examination in open court.

Tennessee. Must be of age and of good moral character. No other requirement. The professional attainments of the applicant are ascertained by any two judges.

Texas. Six months' residence in the state required. Applicant must be of age, and have a good reputation. Graduates from the University of Texas are admitted without examination. Others are examined by a committee on Blackstone's Commentaries, Kent's Commentaries, Stephens on Pleading, Story's Equity Pleading, first volume of Greenleaf, Story on Notes, Story on Partnership, Story's Equity Jurisprudence, or books of like character. He is expected to have some knowledge of the Constitution and statutes of Texas and the practice of her courts.

Utah. Citizen of United States or one having declared intention to become a citizen. Must be of age and of good moral character. All applicants are strictly examined in open court.

Vermont. Must have resided in Vermont six months, be of age, and of good moral character. All are examined in open court by a committee of the bar; but applicant must have studied three years in the office of a practicing attorney, though not more than two of these years may be spent in attendance at a law school chartered by any state of the United States.

Virginia. Must have resided in state six months, be of age, and a person of honest demeanor. It appears that all are subject to examination by the supreme court of appeals on common law, equity, commercial law, and practice, and the Code of Virginia, but the diploma of a law school duly incorporated by one of the United States "is considered."

Washington. Must be a citizen of the United States, have resided in state one year, have a good moral character, and be 21 years of age. The supreme court, by two of its judges, satisfies itself that the applicant has sufficient general learning, but an attorney of the state must certify that applicant has studied law for two years previous to his application and that he believes him to be a person of sufficient legal knowledge and ability to discharge the duties of an attorney and counselor at law.

West Virginia. Must be a citizen, one year a resident of the county, and have a good moral character. All applicants are now (1897) examined by the law faculty of the University of West Virginia for the supreme court.

Wisconsin. Must be a resident of the state and be of good moral character. Graduates of the law department of the University of Wisconsin are admitted on their diplomas; others are examined by state board of examiners, if they have studied law at least two years prior to the examination.

Wyoming. Must be a citizen, of age, of good moral character, and learned in the law, all of which must be passed upon by the standing committee on admission of each court. An examination is made into the private character and unprofessional literary attainments of applicant.

CHRISTIAN SCIENCE.

The following are the claims of Christian Science, as stated by Mrs. Laura Lathrop, C. S. D., New York:—

The revelation of Christian Science came to Rev. Mary Baker G. Eddy in the year 1866, and its truth and power were immediately demonstrated by signs following. For thirty-two years sinners have been reclaimed, depraved appetites for opium and intoxicating drinks have been destroyed, the sick have been healed of every disease, including insanity; the blind have received their sight, the deaf their hearing, shortened limbs have been elongated, crooked spines have been straightened, and law after law of the human mind has been broken. The one great text-book of this science is "Science and Health," with key to the Scriptures, by Mary Baker G. Eddy, supplemented by another book by the same author called "Miscellaneous Writings." "Science and Health" is now in its one hundred and sixtieth edition, and the demand for it is increasing daily. The Christian Science Publishing House is at 95 Falmouth street, Boston, Mass., and here are published, besides the two books above mentioned, other works by the same author, also *The Christian Science Monthly Journal*, *The Christian Science Weekly*, and the "Christian Science Bible Lessons." At the June, 1905, annual meeting of the Mother Church in Boston the clerk stated that the membership of the Mother Church at its first annual meeting in 1893 was 1,512, the membership now is 34,063, of which number 3,628 were admitted during the past year. Reports from 625 branch churches give them a membership of 38,216, which is a gain of eleven per cent. during the year. There are more than 100 institutes which teach Christian Science, and upwards of 4,000 practitioners of Christian Science Healing are listed in the published directories.

Flourishing churches have been organized in London, England; Paris, France; Dresden and Hanover, Germany, and in Canada, Brazil, and Scotland. Many handsome church edifices have been built in different cities, and many others are in process of erection. The mother church is located in Boston, Mass., and those all over the country are its branches. Their services are uniform, consisting of two meetings on Sunday and one on Wednesday evening. No sermons are preached by a personal pastor, but a sermon made up of selections from the Bible and "Science and Health," with key to the Scriptures, is read by two readers, called the first and second readers. This church is emphatically a healing

church, and many cases of restoration to health have been testified to during the past few years, brought about by attendance on one of these meetings.

Christian Science is demonstrable Christianity. Through the spiritual understanding of the teachings of Christ Jesus, its followers are enabled to obey his command to "heal the sick" and do the works he and his disciples did. The omnipotence, omnipresence, and omniscience of God are proved to be true. Christian Science is not mind cure, as that is popularly understood, because it recognizes but one mind, God. It is not faith cure, because it does not perform its wonderful works through blind faith in a personal God, but through the understanding of man's relation to God. It is not mesmerism nor hypnotism, because it denies absolutely the power of the human mind and human will, and claims no will but God's. Through recognizing the one mind and man as the reflection of that mind, it forever establishes the brotherhood of man. It is the perfect salvation from sin, disease, and death Christ Jesus came to bring. In "Rudimental Divine Science," Mrs. Eddy defines Christian Science "as the law of God, the law of good, interpreting and demonstrating the principle and rule of eternal harmony."

REQUIREMENTS FOR PRACTICE OF MEDICINE.

Qualifications as to citizenship, personal character, education, and professional attainments required by the several states from those who are licensed to practice medicine. From reports to the United States Bureau of Education.

California. No qualifications are specified except that the individual must be a graduate of a "recognized" college; that is, one recognized by the Association of American Medical Colleges.

Colorado. Diploma of recognized reputable school, or ten years' practice of medicine as a business. Anatomy, chemistry, physiology, pathology, surgery, practice of medicine, and obstetrics and diseases of women.

Connecticut. He may be a common drunkard, a notorious libertine, or a criminal abortionist as far as the letter of the law disqualifies him. Anatomy, physiology, medical chemistry, obstetrics, surgery, pathology, diagnosis, therapeutics, practice and materia medica. Examination and diploma necessary.

Delaware. Must furnish proof of good moral character and good common school education. Must have studied medicine at least four years, including three regular courses of lectures in different years in some legally incorporated college or colleges, prior to his having received a diploma.

Florida. Diploma of a college recognized (by the American Medical Association); but any holder of a diploma of a medical college may demand an examination, which all must pass.

Georgia. Three courses in a regular medical college and successful passage of examination before board.

Idaho. Citizen of United States or has declared intention of becoming such, and evidence of good moral character. But said board may also refuse a license for unprofessional conduct, etc. The words "unprofessional conduct, etc." is declared to mean—First. The procuring or aiding or abetting in procuring a crim-

inal abortion. Second. The employment of what are popularly known as "cappers" or "steerers" in procuring practice. Third. The obtaining a fee on the assurance that a manifestly incurable disease can be permanently cured. Fourth. The wilful betrayal of a professional secret to the detriment of a patient. Fifth. All advertisements of medical business in which untruthful and improbable statements are made. Sixth. All advertisements of any medicine or means whereby the monthly periods of women can be regulated or the menses can be re-established if repressed. Seventh. Conviction of any offense involving moral turpitude. Eighth. Habitual intemperance in the use of ardent spirits, narcotics, or stimulants. Diploma of a reputable medical college and an examination.

Illinois. Good moral character. A diploma or certification of graduation from a high school or evidence of having passed the matriculation examination to a recognized literary or scientific college, or a certificate of successful examination by the faculty of any reputable university or college, or by the state superintendent of public instruction in the following branches: English grammar, arithmetic, elementary physics, United States history, geography, Latin (equivalent to one year in a high school). One year is allowed in which to cure defects in Latin, but the student must be provided with a certificate of proficiency in this branch of learning from the designated authorities before he can be accepted as a second course student.—(Medical Practice Act.) Diplomas of colleges recognized by the state board of health as being in "good standing." Diplomas from conditional colleges are recognized, but must be supplemented by an examination in medicine, surgery, gynecology, and obstetrics, a percentage of 80 being required. Graduates of colleges in the United States that are not recognized by the board are required to pass an examination in all the branches of medicine. Graduates of Canadian colleges and foreign colleges and universities are required to supplement their diplomas with an examination in practice, surgery, gynecology, and obstetrics, unless they present evidence of their right to practice medicine and surgery in the province and country in which the college is located from which they receive their diplomas.

Indiana. Must reside within the state and possess a good moral character, attested by two freeholders under oath. After July 1, 1899, no medical college will be recognized as in good standing which does not require the entrance qualifications prescribed by the Association of American Medical Colleges as a prerequisite for matriculation. (Same as Illinois.) Since 1899, July 1, no diploma will be recognized if given by a college possessing an inadequate equipment for teaching medicine, which has not clinical and hospital facilities, and which does not have an active and competent faculty, embracing the departments of anatomy, physiology, chemistry, materia medica, therapeutics, medicine, surgery, obstetrics, histology, pathology, bacteriology, ophthalmology, otology, gynecology, laryngology, dermatology, hygiene, and state medicine, and which does not enjoin attendance upon 80 per cent. of four regular courses of instruction of not less than twenty-six weeks each in four different years, and which does not exact an average grade of 75 per cent. on an examination as a condition of graduation.

Iowa. Certificate refused to one who is incompetent, convicted of felony, grossly immoral, or is an habitual drunkard. Good character must be certified to by two physicians of the state. Literary qualifications same as those of Illinois. Diploma of recognized medical college teaching in a four or more years' course anatomy, physiology and hygiene, chemistry, materia medica and therapeutics, theory and practice of medicine, pathology and pathological anatomy, surgery, obstetrics and gynecology, bacteriology and microscopy, and medical jurisprudence. Each course shall continue for twenty-six weeks.

Kansas. Good moral character is required. A diploma of a recognized medical school. Registration.

Louisiana. A good moral character, average education, as shown by technical examination before board. Must have diploma from medical college in good repute, having three courses of six months each in different years. An examination before the board on all the branches of medicine.

Maine. Certificate of good moral character, only so far as the board may take it upon itself to decide. All must pass an examination on anatomy, physiology, pathology, materia medica, therapeutics, surgery, the principles and practice of medicine, obstetrics, or such

branches thereof as the board may deem necessary that the applicant should possess.

Maryland. Testimonials to moral character. The candidate should at least possess a high school education. Must be a graduate of some reputable medical school having a three years' course, but an effort is being made to extend the course to four years. Non-graduates of a college of medicine are examined in practice, surgery, anatomy, materia medica, therapeutics, physiology, chemistry, jurisprudence, obstetrics, gynecology, hygiene, and pathology.

Massachusetts. Good moral character and twenty-one years old. All applicants are required to pass a satisfactory examination in surgery, physiology, pathology, obstetrics, and practice of medicine. College diplomas not a factor in testing an applicant's qualifications for practice.

Michigan. Every graduate of any legally authorized medical college in the state, or in any one of the United States, or in any other country, shall be deemed qualified to practice medicine and surgery in all its departments after having registered.

Minnesota. Good moral character. Evidence of ignorance in ordinary spelling and writing count against a candidate, at option of examiner. The applicant for license must present evidence of having attended upon three separate courses of medical study at a college having not less than six months' duration each. Study with physician not necessary. [Other] applicants are required to pass an examination in anatomy, physiology, histology, pathology, chemistry, medical jurisprudence, preventive medicine, obstetrics, practice, surgery, diseases of women and children, materia medica, eye and ear diseases, toxicology.

Missouri. The law prescribes no qualifications; but in regard to personal character and citizenship the board has made a rule, which has not been questioned, according to which an applicant must present two letters of recommendation from physicians as to his moral and professional character, and he must be a resident of the state unless he makes affidavit that he resides in a county of another state, which county lies upon the border of Missouri. Under a recent decision of the supreme court it is necessary only to be the possessor of a diploma from a legally chartered medical school in good standing to be admitted to registration. The good standing of the school to be determined, like the reputation of an individual, by testimony. The court decided that the law did not authorize the board to set up a standard.

Montana. None; but board may refuse to grant license on moral grounds. Applicants must possess a diploma from a reputable school of medicine, whose professors and teachers are graduates of a school of that kind, and which requires attendance upon four courses of lectures of at least six months each.

Nebraska. Diploma of a recognized medical college and an examination.

Nevada. A medical education and a diploma from some regularly chartered medical school, said school to have a bona fide existence at the time when said diploma was granted.

New Hampshire. Good moral character and twenty-one years of age. Must have graduated from a registered college or satisfactorily completed a full course in a registered academy or high school, or had a preliminary education considered and accepted by the regent (state superintendent of education) as fully equivalent. Our state pays now (1899) no attention to medical college diplomas except from Dartmouth. Since 1893 Dartmouth graduates have been obliged to stand examination. Applicant must have studied medicine not less than four full school years of at least nine months each, including four satisfactory courses of at least six months each, in four different calendar years, in a medical college registered as maintaining at the time a satisfactory standard. The regent shall accept as the equivalent for any part of these requirements or those concerning a literary education, evidence of five or more years of reputable practice provided that such substitution be specified in the license, or has either received the degree of bachelor or doctor of medicine from some registered medical school, or a diploma or license conferring full right to practice medicine in some foreign country. (Recent law.)

New Jersey. Nothing as to citizenship, but at least two physicians, one of New Jersey, must vouch for personal character. Candidates must be graduates from an accredited literary or scientific college, or have completed satisfactorily not less than a three years' course

in an accredited high school or academy, or have received a preparatory education covering the following branches, viz., orthography, arithmetic, English grammar and composition, geography, history of the United States, algebra, and physics, or what this board of examiners may consider their equivalent. Candidates must have received a diploma conferring the degree of doctor of medicine from some legally incorporated medical college (which in the opinion of the board was in good standing at the time of issuing said diploma) in the United States or a diploma or license conferring the full right to practice all the branches of medicine and surgery in some foreign country, and have also studied medicine four years, including three courses of lectures in different years in some legally incorporated American or foreign medical college or colleges prior to the granting of said diploma or foreign license; provided, however, that two courses of medical lectures, both of which shall be either begun or completed within the same calendar year, shall not be considered as satisfying the above requirements. All examinations shall be written in the English language and the questions shall be, except in materia medica and therapeutics, such as can be answered in common by all schools of practice.

New Mexico. Two certificates well accredited as to personal character and professional standing. Our board disapproves of medical schools doing their own examination of candidates for matriculation. It requires that each candidate for admission to a medical school shall furnish as a minimum a high school certificate—preferably a college degree. No study with a physician required. As to professional study our board has not specified at length its requirements except as to time (four years), and terms of lectures (courses) (four) and conditions for matriculation. [A diploma of a legally chartered medical institution in good standing will admit to practice—law.]

New York. Certificate of good moral character from not fewer than two physicians in good standing; also evidence that applicant has the general education required preliminary to receiving the degree of bachelor or doctor of medicine in this state (medical student certificate), or graduation from a registered college, or satisfactory completion of a full course in a registered academy or high school, or had a preliminary education considered and accepted by the regents of the University of the State of New York as equivalent to such high school course. Evidence that applicant has studied medicine not less than four full years of at least nine months each, including satisfactory courses of at least six months each, in four different calendar years in a medical school registered as maintaining at the time a satisfactory standard. The applicant for license to practice medicine in New York state (not a graduate) must pass examinations in anatomy, physiology, hygiene, chemistry, surgery, obstetrics, pathology, and diagnosis, therapeutics, practice, and materia medica.

North Carolina. Certificate of good moral character from some one known to the board. Education decided by character of papers handed in on examination. No attention paid to diplomas. Satisfactory examination in all branches of medicine. No study with physician required. Examinations are comprehensive but are liberal; 80 per cent. is necessary to pass however.

Ohio. Good moral character from two registered physicians of the state. All medical colleges of the United States requiring a minimum of three years of study of medicine and two courses of lectures for graduation prior to 1886, and possessing proper facilities for teaching and a faculty embracing the chairs of anatomy, physiology, chemistry, materia medica, therapeutics, medicine, surgery, and obstetrics, shall be recognized as in good standing, and diplomas issued by the same and properly verified shall entitle the holders thereof to register as graduates in medicine. For the ten years ending in February, 1896, all medical colleges exacting the foregoing requirements and possessing facilities and a faculty as specified above shall, by virtue of such facts, be recognized as in good standing to and including the year 1892, but that no medical college shall be recognized as in good standing which has not since 1892 possessed the foregoing facilities and faculty, and in addition has not exacted an entrance qualification and attendance upon three regular courses of lectures as a condition of graduation. On and after July 1, 1899, no medical college will be recognized as in good standing which does not require the entrance qualification prescribed by the Association of American Medical

Colleges as a prerequisite for matriculation, which does not possess an adequate equipment for teaching medicine, which has not clinical and hospital facilities based upon a minimum municipal population of 50,000, and which does not have an active faculty embracing the departments of anatomy, physiology, chemistry, materia medica and therapeutics, medicine, surgery, obstetrics, histology, pathology, bacteriology, ophthalmology and otology, gynecology, laryngology, hygiene, and state medicine, and which does not enjoin attendance upon 80 per cent. of four regular courses of instruction of not less than twenty-six weeks each, in four different years, and which does not exact an average grade of 75 per cent. on an examination as a condition of graduation, providing that the rule relative to population as a basis for clinical and hospital facilities shall not apply to institutions under state control and which by virtue of such control receives gratuitously patients from all parts of the state in which such colleges are located.

Oklahoma. Certificate of good moral character, and that holder is not an habitual drunkard. None, if a graduate from a medical college in good standing; if not a graduate, applicant must have been a practicing physician for five years, and pass an examination before the board on the several branches of medicine.

Oregon. Good moral character required. No attention paid to college diplomas. All must stand an examination before state medical board on anatomy, physiology, etc.

Pennsylvania. Applicant must be twenty-one years of age, of good moral character and have a high school education or its equivalent. Four years study of medicine in some legally incorporated medical college of the United States or a diploma or license conferring the full right to practice all the branches of medicine and surgery in some foreign country. Others must stand an examination before the Board.

Rhode Island. Citizenship is a new question, and has never occurred to us before, but will now receive attention. Personal character has not been required. It is difficult to establish [true] character of applicant, but we do not issue certificate until applicant has been in practice for three months in this state, and if he turn out an advertising, charlatan person we refuse to grant certificate. A high school or academic education is required of all colleges in "good standing." Examination on eleven branches of medicine required. Applicant [for examination] must have obtained diploma from a school having a four years' course in medicine during the year of graduation. One year at a veterinary or dental school will not pass for a year of study in medicine. School must have a course of twenty-six weeks, teach all main and supplementary branches. Study with physician not required, nor is it accepted as a part of the four years. Diplomas of schools located in cities of fewer than fifty thousand people not accepted.

South Carolina. None but graduates of a medical school entitled to an examination; and the state board examines on all the branches of medicine.

South Dakota. Good moral character, and must not be an habitual drunkard. Anyone who is a graduate of a lawful medical college, who has attended three full courses of medical lectures of six months each. No two full courses to be taken within the same year.

Tennessee. Must be a bona fide resident of the state, and located at some designated place. We have no law allowing us to examine into personal character. Applicant must have a fair education, of which the board may be the judge. Law pays no attention to diplomas, but requires all applicants to stand an examination on anatomy, physiology, etc.

Texas. Must have an education equal to that given in a high school. A diploma from any college or university is held by the higher courts as equal to a certificate from one of the district examining boards.

Utah. No special requirements other than a diploma from a reputable medical college; and passing an examination in all the branches of medicine and surgery.

Vermont. Diploma from a reputable and recognized school and passing examination before a state board of examiners on anatomy, physiology, surgery, chemistry, materia medica, practice, obstetrics, and pathology.

Washington. Board has large powers of discretion as to estimating moral character. The state medical examining board does not regard a diploma [of a school] of any state as sufficient to entitle holder of same to practice in this state, but will consider such diploma in connection with the examination of the holder of the same for a license. All applicants are examined in nervous diseases, obstetric diseases of women and chil-

dren, anatomy, practice, histology, surgery, physiology, medical jurisprudence, materia medica, chemistry, diseases of the eye and ear, preventive medicine.

West Virginia. Good moral character and English education. Diplomas are not recognized. All must pass examination by state board.

Wisconsin. Must not have been convicted of crime in course of professional business. All are examined save those who possess a diploma from a medical college having three or more courses of lectures of six months each, and after the year 1904 at least four courses of not less than six months each, no two courses to be taken during the same year.

Wyoming. None. No person shall be allowed to practice medicine, surgery, or obstetrics who has not received a medical education and a diploma from some regularly chartered medical school, said school to have a bona fide existence at the time when said diploma was granted.

Windsor Castle is situated on the right bank of the Thames, twenty-three miles west of London, near the town of Windsor. The royal residence and the buildings connected with it cover twelve acres of ground, and stand in the midst of a park known as "Little Park," which is four miles in circumference, and is connected by a long avenue of trees, south of the castle, with the "Great Park," which is eighteen miles in circuit. The castle was founded by William the Conqueror. The original plans were enlarged upon and completed by Henry I., and the castle was first used as a royal residence about 1110. The history of the existing edifice, however, begins in the reign of Henry III., but it was not until the time of Edward III. that all its portions were completed. The buildings may be said to be grouped in three portions—the middle ward containing the Round Tower, which was built by Edward III., in the eighteenth year of his reign, to receive the Round Table of the Knights of the newly formed Order of the Garter; the lower ward, on the west, containing St. George's chapel, which was begun by Henry III., completed by Edward III., rebuilt by Henry VII., and added to by Cardinal Wolsey, and the houses of the military knights, cloisters, etc.; and the upper ward, on the east, containing the sovereign's private apartments. Some additions were made to the buildings by Henry VIII., and Queen Elizabeth formed the terraces and built the gate now called by her name. The Star building was erected by Charles II. In 1824-'28, the castle was repaired and enlarged; but little alteration has since been made. The park and forest immediately adjoining contain many historical trees—such as Elizabeth's Oak; Shakespeare's Oak; the Long Walk, made in the reign of Charles II.; and Queen Anne's Ride of Elms, three miles long. Herne's Oak, rendered so famous by Shakespeare, was blown down in September, 1863, and a stone and a young tree now mark the spot. The oldest planted timber in England—that of the reign of Elizabeth—is also in Windsor Park; and

there are many oaks of which it is well established the age must be one thousand years. In the royal vaults connected with St. George's chapel a number of kings and queens are buried.

Vedas and Puranas, as the great body of the sacred literature of the Hindoos is called, are written in poetry in the most ancient form of the Sanskrit language. The Vedas, which were believed to be inspired, treat of the thirty-three gods of the heavens, of the air, and of the earth; of the creation of all things, of the relation of the gods to each other, and the relations and duties of men to each other and to the gods; of surgery, medicine, music, dancing, war, architecture, mechanical arts, astronomy, astrology, grammar, poetry, etc. The Puranas are eighteen in number, and are regarded with great reverence as the production of holy men. They treat of law, theology, including histories of their gods, logic, and metaphysics in general, but are filled in the main with superstitions and silly and disgusting narratives.

Unitarians.—The Unitarians of the present day, like almost all Christian sects, must be divided into two classes—a conservative and a progressive class—or, as they are often called, an old and new school. The former adopt the old rule of the sufficiency of Scripture, though with such qualifications as the scientific criticism of the Bible has rendered indispensable. The most conservative Unitarian, for example, would not contend for the literal truth of the first chapter of Genesis, nor for the doctrine of verbal inspiration in any shape. “The Bible is *not*, but it *contains*, the Word of God,” is the form which best expresses their position on this subject. They generally hold the simple humanity of Christ, and even reject the supernatural birth, thinking the part of the gospels which record that event to be less authentic than the parts referring to the ministry, the death, and resurrection of Christ. What, however, chiefly distinguishes the Unitarians of this school from those of the new or progressive school is the place which they give to the miracles as supernatural sanctions of the truth of Christianity. Denying that man has any immediate knowledge of the intuition of spiritual things, they regard Christianity as a system of moral and religious truth external to man's nature, and requiring, in proof of its divine origin, certain evidences beyond its inherent credibility and adaptation to human wants. This evidence they find in the miracles, which they accept as well-attested facts, on the same ground on which all historical facts are accepted. The Unitarians of the progressive school, so far from regarding man

as entirely dependent upon his reasoning powers for his knowledge of religion, rather look upon him as standing in a living relationship with the one infinite source of all truth, and as having within his own nature the germs of the highest religious faith. To this view of Christianity the miracles are not felt to be essential as proofs. Generally speaking, the Unitarians of this school are disposed to regard with favor the freest criticism of the Bible. Unitarians of all shades of opinion are agreed in rejecting the entire orthodox scheme—including the doctrines of the Trinity, the vicarious atonement, the deity of Christ, original sin, and everlasting punishment—as both unscriptural and irrational. They celebrate the Lord's Supper in their churches, not as a sacrament, but as a service commemorative of Christ's death and expressive of spiritual communion with him.

St. Nicholas and Christmas.—The origin of the idea that presents are presented at Christmas time by St. Nicholas, or Santa Claus, probably originated from the following circumstance: St. Nicholas is said to have been Bishop of Myra, and to have died in the year 326. He was noted for his fondness for children, and became their patron saint, and the young were universally taught to revere him. He is said to have supplied three destitute widows with marriage portions by secretly leaving money at their windows, and as this occurred just before Christmas, he thus became the purveyor of the gifts of the season to all children in Flanders and Holland, who hung up their shoes and stockings in the confidence that Knecht Clobes, as they called him, would put in a prize for good conduct. Formerly, and still, in some parts of Germany, the practice is made of all the parents in a small village sending the presents to some one person, who, in high buskins, a white robe, a mask, and an enormous flax wig, goes from house to house on Christmas eve, and, being received with great pomp and reverence by the parents, calls for the children and bestows the intended gifts upon them, after first severely questioning the father and mother as to the character and conduct of the child. As this custom became less frequent, the custom of children hanging up their stockings was substituted; and, as the purveyor no longer visited the houses, it was necessary to explain it by telling the children that he came into the house at night, coming down the chimney and leaving their presents and departing. The custom of decking the houses and churches at Christmas with evergreens is derived from ancient Druidical practices. It was an old belief that sylvan spirits flock to the evergreens and re-

main unripped by frost until a milder season, and it was probably on account of the good omen attached to the evergreen that Christmas trees came into use.

Valentinians, a Gnostic sect or school [see GNOSTIC] founded by Valentinus, who went from Alexandria to Rome about A. D. 140. The distinguishing feature of his system lies, in the first place, in his recognizing heathenism as a preparatory stage of Christianity, and then his dividing the higher spiritual world into fifteen pairs of æons, each consisting of a male and a female. The first pair, or syzygy, is made up of Bythos, or God in himself, and Ennoia, or God as existing in his own thoughts. From these emanated, next, Nous (Intelligence) and Aletheia (Truth), and so on. As the last æon, Sophia, transgressed the bounds that had been laid down by the æon Heros, and a part of her being became lost in Chaos, there was formed a crude being called Achanroth, which, through the Demiurgos that emanated from it, created the corporeal world. Heros now imparted to the souls of men (for all the bodies composing the corporeal world are possessed of souls) a pneumatic, or spiritual, element; but this only attained to full activity when Christ, a collective emanation from all the æons, appeared as a Saviour and united himself with the man Jesus. In the end, all that is pneumatic, and even the originally psychic, or soul element, in as far as it has assimilated itself to the psychic, will return into the Pleroma.

Universalists.—The distinctive peculiarity of the Universalist faith consists in the belief that "evil" will ultimately be eradicated from the world, and that all erring creatures will be brought back to God through the irresistible efficacy of Christ's divine love. They argue that when an infinite, wise, holy, and benevolent God resolved to create man, it could only be with a view to his everlasting good; that if he did allow him to be tempted and to fall, it must have been because he foresaw that through sorrow and suffering man could rise to higher degrees of perfection; that, therefore, all punishment is of necessity designed as a remedial agent, and not intended to satisfy God's indignation as a sovereign at the disobedience of his subjects; that no other view of the subject is compatible with the scriptural, and especially the New Testament, representation of God as a "Father," or with the oft-repeated declaration (in various terms) that Jesus Christ was a propitiation for the sins of the whole world. Universalism, as a mode of belief, is of very ancient origin, and its modern adherents, beside urging its congruity with the divine plan of redemption as revealed

in Scripture, point to the earliest Christian writings, *e. g.*, the Sibylline oracles of Rome, and cite passages in favor of the doctrine from many of the Church fathers. Universalism was preached in the United States as early as 1741, but the first separate Universalist church was not established until 1780, when the Rev. John Murray started one at Gloucester, Mass. Since his time an important body has sprung up which contains many able, learned, and pious divines.

Roman Catholic Church.—The name generally given to that very numerous body of Christians who acknowledge the Pope, or Bishop of Rome, as the head of their church.

Broadly speaking the Church is comprised of clerical members and lay members. Under the term "clergy" are included all those who exercise spiritual authority. There are various ranks of the clergy which, taken as a whole, constitute the hierarchy. The office of the apostles is perpetuated in the bishops, and the primacy of Peter in the Roman pontiff. The Pope enjoys immediate jurisdiction over the entire Church. Nevertheless, each bishop in his own diocese is possessed of a real authority, in virtue of which he governs the faithful committed to his charge, ordains priests and ministers and grants them the jurisdiction necessary to the performance of their sacred duties. These ministers are of two classes: those who receive major orders—deacons and sub-deacons—and those who receive minor orders—acolytes, exorcists, lectors, and *ostiarii*.

A number of dioceses are united into a province under an archbishop or metropolitan, of whom the bishops are said to be suffragans.

In the exercise of his supreme jurisdiction the Pope is aided by the College of Cardinals, which is composed of seventy members created by the Pope, and organized into twenty-one congregations. These congregations with their subordinate officials constitute the Roman curia, the ordinary organ of papal government.

In doctrine the authority of the Church is held infallible in matters of faith and morals, and the teaching of the Church is by the pastors in union with their head, the Pope, and by the Pope himself speaking *ex-cathedra*. The immediate sources of doctrine are the ordinary teaching of the Church, the definitions of the Pope, or those of an œcumenical council.

The sacraments of the Church are seven in number: Baptism, confirmation, Holy Eucharist, penance, extreme unction, orders, and matrimony. The mass is the principal act of worship of the Church, and is the center

of her liturgy. The office, or public prayer of the Church, is a collection of psalms, extracts from both Testaments, commentaries of the Fathers, and short lives of the saints. Ecclesiastical *feasts* are days set apart for honoring in a special way some event in the life of Christ, of the Blessed Virgin Mary, or of the other saints. The Church has encouraged the founding of religious orders, whose members are bound by special vows, and labor for some specific purpose, such as caring for the poor and sick, spreading the Gospel, or carrying on the work of education.

The number of Roman Catholics all over the world is estimated at about 230,000,000. In the United States the Catholic population is over 11,000,000.

Additional statistics may be found on page 574.

The Reformation, term universally applied by Protestants denoting change from Roman Catholic to the Protestant religion, which was originated in Germany by Luther, A.D. 1517, but had been begun in England by Wycliffe, and was afterwards completed by Henry VIII., who assumed the title of "Head of the Church."

Luther's conflict with the Church of Rome began when he boldly attacked the doctrine of indulgences. The proclamation of indulgences was not new in Germany, nor was opposition to it on the part of the people and of both civil and ecclesiastical authorities new. The struggle was precipitated, however, when Albert of Brandenburg appointed John Tetzel, of Leipsic, a learned and eloquent Dominican, to preach the indulgences among the people. New opposition at once broke out, and Luther took the lead. He drew up his objections in the shape of ninety-five propositions, which he fastened to the door of the Castle church at Wittenberg, on All Saints' Eve (Oct. 31, 1517). In these he attacked the abuse, not the doctrine, of indulgences, pronouncing anathema on whosoever spoke against the truth of papal indulgences. Nevertheless the propositions contained the germs of his future heresy and gave rise to the movement known as the Protestant Reformation. He at once gained a number of adherents, among them men of influence both in church and state. A vigorous and oftentimes exceedingly discourteous controversy followed which led to Luther's being summoned to Rome to defend himself. At the request of the Elector Frederick, the Diet of Augsburg was substituted for Rome as the place of the trial, and Cardinal Cajetan, papal legate, was appointed to represent the pope at the Diet. Luther claimed that he had said naught against the Scriptures, the doctrine of the church, the decrees of popes, or reason.

In short, made a complete retraction, and fled from Augsburg angry at heart. In 1520 he launched out pamphlet after pamphlet assailing in virulent terms the whole office and dignity of the papacy, setting out that the Bible was the only source of faith. These doctrines caught the hearts of the multitudes. Luther appealed strongly to the spirit of nationality and aggrandizement. He addressed the emperor, the nobles, and the people. He urged the emperor to overthrow the power of the pope, confiscate the wealth of the church, abolish feasts and holidays and masses for the dead. On June 15, 1520, the pope issued a bull specifically condemning Luther's teachings, and excommunicating him if he refused to retract within sixty days. Luther appealed from the authority of the pope to a general council, and publicly burned the pope's bull at Wittenberg, consigning the pope himself to "fire eternal." The Diet of Worms placed him under the ban of the empire as a heretic, but the circumstances of the time and the opposition of the German States rendered the edict ineffective. From these beginnings the Reformation spread throughout the German Empire and thence to various other countries.

Christianity is based upon a new and specific revelation in the person of Jesus Christ. Its aim is to restore to mankind the lost fellowship with God in an eternal kingdom, set up here on earth, and called the Church, to be brought to its full and perfect consummation in the world to come. The foundation of a Christian's faith and practice is ultimate, and, in truth, the only appeal must be to the facts, the doctrines, and the precepts of the Scriptures, especially those of the New Testament. The history of Christianity, then, is the record of the facts pertaining to the nature and growth of the Kingdom of God upon earth, in their external and internal relations. This history falls into three main divisions: Ancient, Mediæval, and Modern. The Ancient history of Christianity is the narrative of the supremacy won by the church over Greek culture and the Roman Empire. It closes and the Mediæval history begins, with the epoch of the Carolingian dynasty. The Mediæval comprises the victories of the church over the Celtic, Teutonic, Slavonian, and Scandinavian tribes in the center and north of Europe, the conflicts and rupture of the eastern and western branches of the church, and the contest between the imperial and papal powers for supremacy. This period closes with the Reformation. The Modern history recites the struggles between Catholicism and Protestantism, between Christianity and philosophy, and the growth of Protestant civilization.

The history of the world presents no phenomenon so striking as the rise and early progress of Christianity. Originating in a country not remarkable for any political, commercial, or literary influence, emanating from One who occupied an humble sphere in the community amidst which he appeared, and announced in the first instance by men of mean extraction, of no literary culture, and not endowed with any surpassing gifts of intellect,—it nevertheless spread so rapidly that in an incredibly short time it had been diffused throughout the whole civilized world, and in the fourth century of its existence became recognized as the established religion of the Roman Empire. When it is remembered that this result was achieved not only without the aid of any worldly influence, but in the face of the keenest opposition on the part of all the learning, wealth, and power of the most enlightened and mightiest nations, the conclusion is strongly forced upon us that a power beyond that of man was concerned in its success, and that its early and unexampled triumphs afford an incontestible proof of its inherent truth and its divine origin. The continual and steady growth of Christianity, its vigorous life in spite of various seasons of unavoidable ebb, and notwithstanding the presence of many forms of corruption, and its continual rejuvenescence, are no ordinary proof of its supreme fitness for the position in the world which it claims to occupy.

Harvard University, the oldest school in America, was founded in 1636, six years after the first settlement of Boston. The Commonwealth of Massachusetts, through its General Court, in that year made a grant of 400 pounds "to advance learning and perpetuate it to posterity," and in the following year appointed twelve of the principal men in the colony "to take order for a college at Newtown." Two years afterward the Rev. John Harvard, a Non-Conformist clergyman of Charlestown, who the year before had graduated at Emmanuel College, Cambridge University, England, gave by his will the sum of 779 pounds, and 300 books, more than half of his estate. Nine students entered the first class. All of these distinguished themselves in after life, one of them, Sir George Downing, achieving the unenviable distinction of serving both the Commonwealth and the king in the English Revolution. John Harvard's bequest was followed by other gifts, such as a font of letters, books, silver spoons, cooking utensils, garden tools, and others, varying in value from 3 shillings to £200. The first gift of real estate was two and one half acres of land given by the town of Cambridge, thereby

changing the nominal location from Newtown to Cambridge. The General Court, in lieu of the money it had promised, granted to Harvard College the right of ferry between Charlestown and Boston. In 1642, the board of overseers, consisting of the governor and deputy governor of the colony, the magistrates then in jurisdiction, the president of the college, and the teaching elders, was constituted. In 1643 the present seal of the University and its motto, "Christo et Ecclesiæ," was adopted. The college charter was granted in 1650, and the college corporation created. In 1653 Rev. Henry Dunster, the first president, fell under suspicion of favoring the Anti-pædo Baptists and as a consequence was indicted by the grand jury for disturbing the ordinance of infant baptism in the Cambridge church. He was tried, convicted, and besides being compelled to resign, and being laid under bonds for good behavior, was sentenced to receive an admonition once a year. Previous to this, Nathaniel Eaton, the first person in charge of the institution, was dismissed for beating his usher. The presidents in succession, with their terms of office, have been as follows: Henry Dunster, 1640-1654; Charles Chauncy, 1654-1672; Leonard Hoar, 1672-1675; Urian Oakes, acting president, 1675-1679; president, 1679-1681; John Rogers, 1682-1684; Increase Mather, acting president, 1685-1686; rector, 1686-1692; president, 1692-1701; Charles Morton, vice-president, 1697-1698; Samuel Willard, vice-president, 1700-1707; John Leverett, 1707-1724; Benjamin Wadsworth, 1725-1737; Edward Holyoke, 1737-1769; Samuel Locke, 1770-1773; Samuel Langdon, 1774-1780; Joseph Willard, 1781-1804; Samuel Webber, 1806-1810; John Thornton Kirkland, 1810-1828; Josiah Quincy, 1829-1845; Edward Everett, 1846-1849; Jared Sparks, 1849-1853; James Walker, 1853-1860; Cornelius Conway Felton, 1860-1862; Thomas Hill, 1862-1868; Charles William Eliot, 1869 to the present time.

During the term of the second president, a hall, costing £350, was erected, for the purpose of giving instruction to Indians, but one Indian only applied for admittance and was graduated by the college. Before this, a single building had served all the purposes of the college. All the college halls that were erected after this during the seventeenth century were subsequently razed or destroyed, so that the oldest building now standing on the Harvard yard is Massachusetts Hall, erected in 1720. Harvard College, from that time on, prospered, and now has property and endowment aggregating almost fifteen million dollars. The University is divided into the following departments, with

separate faculties or board of administration: Harvard College, Lawrence Scientific School, Graduate School, Divinity School, Law School, Medical School, Dental School, School of Veterinary Medicine, Bussey Institution (a school of agriculture), Arnold Arboretum, University Library, Museum of Comparative Zoölogy, University Museum, Botanic Garden, Herbarium, Astronomical Observatory, Peabody Museum of American Archeology and Ethnology. Radcliffe College, formerly known as the Harvard Annex for women, though intimately connected with the University, is still a separate institution. The degrees granted by the University are: Bachelor of arts, of agricultural science, of divinity, of laws, of science, master of arts, and doctor of philosophy, science, laws, medicine, veterinary medicine, and dentistry. Since the foundation of Harvard College, nearly twenty thousand students, in all, have been graduated, of whom some eleven thousand are alive.

Yale University was founded in 1701 by the Revs. John Pierrepont, Andrew, and Russel, of Branford and Milford, three graduates of Harvard, assisted by Cotton and Increase Mather, Eleazor Kimberly, John Eliot, and the judges of the General Court then in session at New Haven. The first gift to the projected school consisted of books from the libraries of each of the three founders, and of 637 acres of wild land given by Major James Fitch, who also agreed to furnish, without cost, the glass and nails for the college house. The trustees first placed the school at Saybrook, provided for a baccalaureate course of three years, with three further years for the master's degree, and fixed the price of tuition at thirty shillings for undergraduates and ten shillings for graduates. The first degree was given to Nathaniel Chauncy, who passed all examinations, after mere private study. In 1717 the college was removed to the town of New Haven, which had offered £2,000 and eight acres, but, owing to the division between the trustees concerning the best site, some of the students went to Saybrook, others to East Guilford, others to Wethersfield and Hartford, and others again to New Haven, according to their preferences and those of their tutors. As a consequence, two commencements were held in 1717, one at Wethersfield and one at New Haven. The controversy was ended by the gift of Elihu Yale, the former governor of Madras, whose official conduct and rapid acquisition of wealth had led to his recall to England. Cotton Mather wrote to him for help, promising the adoption of his name by the new college, and Governor Yale accordingly sent to New Haven three

bales of goods, a portrait of George I., the royal coat of arms, and a box of books. In 1721 Elihu Yale died, leaving £500 to the school that bore his name; but for certain reasons the will could not be probated, and the money was lost to the college. In 1722, Rector Cutler and several of the tutors changed their faith from the Congregational church to the Episcopal church, which led to their enforced resignation. As a consequence there ensued an interregnum of three years, during which the college was without rector or proper instruction. At the end of this period the charter was amended. In 1729 the college received valuable gifts from Bishop Berkeley, the philosopher, and in 1752 Benjamin Franklin added a collection of books. By a new charter of 1744, the Collegiate School became Yale College. During the War of the Revolution, the college was twice suspended. When Washington came to New Haven the students formed a company, and, with Noah Webster as their cornet, gave Washington the first military escort in New England. Commencements were not resumed until 1781. Professional schools were added during the presidency of Day. Advanced instruction for graduates was begun in 1847. The first degrees in philosophy were given three years later. The Sheffield Scientific School was organized in 1859. The Art School, succeeding the Trumbull Art Gallery, was erected in 1864, with the Peabody Museum and Conservatory of Music following shortly afterward.

The rectors and presidents — all clergymen, the first six of whom were Harvard graduates, all the rest graduating from Yale — have been: Abraham Pierson, 1701-1707; Samuel Andrew, 1707-1719; Timothy Cutler, 1719-1722; Samuel Andres, 1724-1725; Elisha Williams, 1725-1739; Thomas Clapp, 1739-1766; Nathaniel Daggett, 1766-1777; Ezra Styles, 1777-1795; Timothy Dwight, 1795-1817; Jeremiah Day, 1817-1846; Theodore D. Woolsey, 1846-1871; Noah Porter, 1871-1886; Timothy Dwight, 1886-1899; Arthur T. Hadley, LL.D., 1899-. The University comprises four departments, each under a distinct faculty, to wit: Philosophy and art, theology, medicine, and law. The first embraces the academic department of Yale College, with the Sheffield Scientific School, Graduate School, and the School of Fine Arts and Music, each with its own organization and corps of instructors. The library, Peabody Museum, and observatory have independent organizations. The degrees are: B.A., B.S., M.A., B.D., LL.B., Ph.B., C.E., M.E., M.D., Ph.D., LL.D., D.C.L., with further degrees in fine arts and music. In all departments, nearly seventeen thousand

alumni have been graduated, of whom more than ten thousand are living.

Princeton University.—The first charter was granted in 1746, and the second, making the trustees a self-perpetuating body, in 1748. The college was opened at Elizabethtown, near New York, with Rev. Jonathan Dickinson as president, and was removed to Newark, and soon afterward, in 1753, to Princeton. During the next two years Nassau Hall was erected. Though this hall has twice been damaged by fires, in 1802 and 1855, it still stands. The presidents have been: Jonathan Dickinson, 1747; Aaron Burr, 1748-1757; Jonathan Edwards, 1757-1758; Samuel Davies, 1759-1761; Samuel Finley, 1761-1766; John Witherspoon, 1768-1794; Samuel Stanhope Smith, 1795-1812; Ashbel Green, 1812-1822; James Carnahan, 1823-1854; John MacLean, 1854-1868; James McCosh, 1868-1888; Francis Landey Patton, S.T.D., LL.D., 1888, to the present. The Green School of Science was added in 1873, and a department of engineering in 1875. The sesqui centennial of the college was celebrated in 1896, which marked a material increase of the endowment; the trustees transformed the college into a university, changing its name from the College of New Jersey to Princeton University. The degrees conferred are: A.B., A.M., Ph.D., L.H.D., Litt.D., and LL.D.

University of Pennsylvania.—Through the efforts of Benjamin Franklin a fund was raised in 1749 to change Penn's Charity School, begun in 1720, into an academy. It was opened in 1751, and four years later received a college charter. The first commencement was held in 1757. The school languished for several years so that Provost Smith had to be sent to England to raise funds. He there met the commissioner of King's College, now Columbia University, and they both agreed to share the proceeds of their joint efforts, some six thousand pounds. After his return Provost Smith sided with the "War Party," and was cast into prison for publishing an alleged libelous pamphlet against the Assembly. While in jail he continued to give lectures to his classes, but in 1759 was compelled to flee to England, where he was received with great honor, and made a doctor by Oxford University. He returned after a peaceful settlement of his differences with the Assembly with twenty thousand pounds funds for the college. In 1791 the college was amalgamated with the new school, which was the first to be called a university in this country. The Medical School dates from 1765. A German school was added in 1785, and a law school in 1790. The college continued as an old fashioned classical

college until 1868, when the elective system was introduced. In 1872 the Department of Arts was reorganized, and the Department of Science, known as the Towne Scientific School, was established. In 1877 a department of music, and in 1878 one of dentistry were added. The provosts and presidents have been: Benjamin Franklin, 1749-1756; Richard Peters, 1756-1764; James Hamilton, 1764; John Penn, 1764-1771; James Hamilton, 1771-1773; Richard Penn, 1773-1774; John Penn, 1774-1779; Benjamin Franklin, 1789-1790; William White, 1790-1791; John Ewing, 1791-1802; John McDowell, 1802-1810; Dr. Andrews, 1810-1813; Frederick Beaseley, 1813-1828; William H. DeLancey, 1828-1833; John Ludlow, 1833-1853; Henry Vethake, 1853-1860; Daniel R. Goodwin, 1860-1868; Charles J. Stille, 1868-1880; Charles C. Harrison, LL.D., the present incumbent.

The University buildings, twenty-two in number, are situated on forty-eight acres of ground in West Philadelphia. The General Library, containing more than 150,000 volumes and 50,000 pamphlets, contains a number of private collections. The most notable of these are the Colwell collection, one of the most complete finance libraries in the world, and the Bechstein Library containing 15,000 books on German philology and literature. The Museum of Archæology and Paleontology contains collections of American, Asiatic, and Egyptian antiquities of great value. Its Babylonia collection is declared to rank equal with those of the British Museum and the Louvre. Houston Hall, a clubhouse for students, was finished in 1896, and has proved a valuable aid to college discipline. The usual academic and technical degrees are conferred.

Cornell University was incorporated by the Legislature of the State of New York, April 27, 1865, and opened October 7, 1868. The existence of the University is due to the combined bounty of the United States, the state of New York, and Ezra Cornell. Ezra Cornell's wish was to found an institution where any person could find instruction in any study; while the state stipulated that the college should be strictly non-sectarian, and that it should annually receive from each Assembly district of the state, one student free of charge. The first gift of Ezra Cornell was \$500,000 with 200 acres of land. The first college buildings were built by the students; women were admitted, and a large dormitory known as Sage College was erected for them in 1872. There are no other dormitory buildings on the campus proper, the situation of which, on a plateau between two waterfalls,

overlooking Cayuga Lake, and the settled valley at its head, is unique. In 1890, after a long lawsuit, the large property left to the University by Mrs. Jennie McGraw Fiske, was withheld from it by a ruling of the supreme court of the United States. To make up for this, Henry W. Sage, a previous benefactor of Cornell, gave \$560,000 for the cost and endowment of the new University Library. In addition to this the University has received other large benefactions. The presidents have been: Andrew D. White, 1865-1885; Charles K. Adams, 1885-1890; Jacob Gould Schurman, 1890 to the present.

Columbia University. King's College, as Columbia University was formerly called, was founded in 1754, under royal charter. The college was established on a grant of land known as the King's Farm, the property of Trinity Church overlooking the Hudson river. It was then declared by travelers to have the finest site of any college in the world. In 1857 it was removed to a block between 49th and 50th streets, New York city, overlooking the East river. From the beginning this location was regarded as temporary. The present site on Morningside Heights, between 116th and 120th streets, was the field of the battle of Harlem. It overlooks the Hudson river on one side, and north New York on the other, and is once more declared to be one of the finest sites in the world. The original charter made the college non-sectarian. The first class was graduated in 1760 with eight students. During the Revolutionary war instruction had to be suspended, the president of the college, a royalist, having been forced to flee to England. Names and terms of the presidents are as follows: Samuel Johnson, 1754-1763; Myles Cooper, 1763-1775; Benjamin Moore, 1775-1776; William Samuel Johnson, 1787-1800; Charles H. Wharton, 1801; Benjamin Moore, 1801-1811; William Harris, 1811-1829; William Alexander Duer, 1829-1842; Nathaniel F. Moore, 1842-1849; Charles King, 1849-1864; Frederick A. P. Barnard, 1864-1889; Seth Low, LL.D., 1890-.

A medical faculty was established in King's College in 1767 and consisted at first of six professors. In 1860 the College of Physicians and Surgeons became the medical department of Columbia University. Instruction in law was given in 1793. The School of Mines, now the School of Applied Science, through the efforts of Thomas Eggleston, was founded in 1863. In 1880 a School of Political Science was opened. Barnard College, where instruction is given to women, was founded in 1889. The School of Philosophy was established in 1890, and that of Pure Science in 1892. The

degrees conferred in the various schools are, B.A., B.S., LL.B., M.D., M.A., Ph.D., L.H.D., and LL.D.

Catholic University of America was founded in 1864 after a gift by Miss Caldwell of \$300,000 to the American Episcopate. From 1889 to 1895 its educational activity was confined to the School of Divinity. In 1895, after the pope had expressed a hope that the University might be able to adapt its work to modern educational needs in a wider sense, schools of philosophy and the social sciences were opened, with departments of philosophy, letters, mathematics, physics, chemistry, biology, technology, sociology, economics, political science, and law. During the last few years twelve chairs for the teaching of the arts and sciences have been endowed by individuals. The University is governed by seventeen directors and a chancellor, who is at present Cardinal Gibbons of Baltimore. With the directors, who are for the most part prominent members of the Catholic clergy, are associated by virtue of their office all the Catholic archbishops in the country. The School of Divinity grants baccalaureate, licentiate, and the doctor's degrees; the School of Philosophy confers degrees in letters and philosophy; the School of Social Science, degrees of B.A. and M.A.; the Law School, degrees of LL.B., LL.M., D.C.L., J.C.D., J.U.D., and LL.D.; while in the Institute of Technology, degrees in civil, electrical, and mechanical engineering, with corresponding master's degrees are conferred. The present rector is Very Reverend Thos. J. Conaty, D.D., J.C.D.

University of California was instituted by a law which received the approval of the governor, March 23, 1868. Instruction was begun in Oakland in the autumn of 1869. The commencement exercises of 1873 were held at Berkeley, July 16, when the University was formally transferred to its permanent home. Instruction began at Berkeley in the autumn of 1873. The new constitution of 1879 made the existing organization of the University perpetual. The College of California, which had been organized several years before the University, transferred its property and students upon terms which were mutually agreed upon, and closed its work of instruction in 1869. It had been incorporated in 1855, and through its agency a part of the Oakland property of the University, and the Berkeley site now owned and occupied by the latter, were secured; a domain of about two hundred and fifty acres, situated on the slope of the Contra Costa hills, about five miles from Oakland, facing the Golden Gate. The under-

graduate colleges were the only ones actually included in the original organization. The professional colleges in San Francisco have been added from time to time. The Lick Observatory was formally transferred to the University in June, 1888. The Mark Hopkins Institute of Art, in 1893. The University comprises the following departments: College of Letters, College of Social Sciences, College of Natural Sciences, College of Agriculture, College of Mechanics, College of Mining, College of Civil Engineering, College of Chemistry, Lick Astronomical Department, Mark Hopkins Institute of Art, Hastings College of Law, Medical Department, Post Graduate Medical Department, College of Dentistry, and California College of Pharmacy. The curricula of the various departments lead to degrees of B.A., B.L., B.S., M.A., C.E., D.D.S., D.V.S., LL.B., M.S., M.E., M.D., Ph.G., Ph.B., and Ph.D. The president is Benjamin Ide Wheeler, Ph.D., LL.D.

University of Chicago. The first University of Chicago was founded in 1857, by the Baptist Society of Chicago, and was presided over for many years by the Rev. Dr. Burroughs. In 1886 its doors were closed, owing to lack of funds. Its successor, the present University of Chicago, was founded by John D. Rockefeller, who subscribed \$600,000 of its original endowment fund of one million dollars, to which he afterward added three and a half million dollars in bonds. The original site, valued at \$125,000, was given by Marshall Field, who also gave \$100,000 in money. More than one million dollars for new schools and buildings have since been donated or bequeathed to the University. A president for the University, William R. Harper, Ph.D., LL.D., was elected in the spring of 1891. Work on the new buildings began in the autumn of the same year. On October 1, 1892, the new school opened its doors to some six hundred students. Cobb Lecture Hall and two dormitories for graduates were the only buildings then ready for use. Since that time fifteen of the projected forty-two buildings have been erected, while the number of students has risen to over two thousand. The University includes five divisions: the university proper; the university extension; the university libraries, laboratories, and museums; the university press; the university affiliations. The university proper includes: the Graduate School of Arts and Literature, the Ogden School of Science, the Divinity School, the School of Law, School of Medicine, the School of Technology, the School of Fine Arts, and the School of Music; the colleges of arts, literature, and science.

Leland Stanford, Jr., University was founded in 1884, by Leland Stanford and Jane Lathrop Stanford, who determined to found a university for both sexes, and with all colleges, schools, seminaries, institutes, museums, and collections appropriate thereto. In the following year the Legislature of California passed an authorizing act, and in 1885 the grant was made. The corner stone was laid in 1887, at Palo Alto, some three miles from the sea, near the Monte Diablo Mountain, thirty-three miles from San Francisco. David Starr Jordan, the present president, was installed in 1891. The suit for fifteen million dollars or the original endowment, between the University and the Federal Government, was decided in the University's favor, in 1895. An additional endowment was made by deed of Jane Lathrop Stanford, amounting to more than ten million dollars, in 1899. In the same year the number of women to be admitted to the University in any one year was restricted to five hundred. The University is governed by twenty-four trustees chosen for life. The various courses of instruction lead to the degrees: B.A., B.S., and C.E., while the degrees M.A., M.E., and Ph.D. are conferred after resident post graduate work. No honorary degrees are conferred.

University of Virginia was the first State University established in this country. Thomas Jefferson, after great opposition from all other Virginia colleges, founded the University in 1819. It was then united with Central College, and, after full acceptance of Jefferson's original plans, opened its doors to students in 1825. The University buildings were finished by Italian sculptors, whom Jefferson had imported. Dr. Thomas Cooper, the first professor of the new university, by reason of his heterodox views, was forced to resign immediately after his election, to Jefferson's great chagrin. The founder thereupon turned to Europe for new material, calling no less than four professors from England. In 1824 the new school was visited by George Ticknor of Harvard College, who is believed to have there assimilated the reforms in regard to discipline and elective study, which were afterward introduced by him at Harvard. Two years later, Thomas Jefferson died, after having had sole charge of the University for one year as its first rector. He was buried on the roadside of the highway leading from his house to the University, and his grave is marked by a monument, erected by Congress, bearing the inscription: "Here was buried Thomas Jefferson, author of the declaration of American independence, of the statute of Virginia for religious freedom, and father of the University of Virginia. Born April 2, 1743, o. s. Died July 4, 1826."

After Jefferson's death, the University became heavily indebted, until the state legislature freed its annual appropriation from all incumbrances. A medical school was added in 1827, which has since been enlarged by schools of medical jurisprudence, of surgery, and anatomy. In 1851 the Law School was created, followed in 1856, by the two schools of language and of history, the last of which was endowed with \$50,000 by W. W. Corcoran. A school of technology was added in 1867, followed in 1870 by the establishment of a school of agriculture, on Samuel Miller's endowment of \$100,000. An astronomical observatory was given by Leander J. McCormick in 1882. Connected with it was Professor Sylvester, the famous mathematician. During the war, instruction in the University was suspended. In October, 1895, the Rotunda and Annex built by Jefferson were destroyed by fire, including many books and works of art. Since that time sufficient funds have been raised among the alumni to restore these buildings, and to erect a public hall, physical and chemical laboratories, costing in all, \$250,000. The Rotunda, henceforth, is to be used for library purposes only.

Westminster Palace was erected in 1840 on the site of the old houses of Parliament, which were destroyed by fire in 1834. It is 900 feet long by 300 feet wide, is built of limestone from the Yorkshire quarries, and cost about \$8,000,000. The palace contains the House of Lords and the House of Commons, which are separated by an octagonal hall with a diameter of 70 feet. The House of Lords is 100 feet long, 45 feet wide, and 45 feet high. The room is profusely decorated, and in niches between the windows are statues of barons who signed the Magna Charta—eighteen in number. The gorgeous gilt and canopied throne which is occupied by the Queen when she opens Parliament is in this room, as is also the wool-sack—a large, square bag of wool covered with red cloth—of the Chancellor of Great Britain. The House of Commons is not as handsome as the House of Lords in the matter of decorations, and is not so long, but is the same height and width. The palace also contains a number of other rooms, among which are the Queen's robing room, the guard room, the libraries, committee rooms etc. In the center of the edifice, above what is known as the Octagon Hall, is a tower 300 feet high. At the southwest corner is the Victoria tower, 346 feet high. At the northwest corner is the clock tower, which is surmounted by a belfry spire 820 feet high. In this tower is a clock with four faces, each 80 feet in diameter, and the hours are struck

on a bell called "Big Ben," which weighs nine tons. At the southwestern extremity of the building is the state entrance of the Queen, which communicates directly with what are known as the royal apartments. The entrance to the Octagon Hall is by a passage known as Saint Stephen's Hall, which communicates also with Westminster Hall, a much older building, on the north.

West Point Academy.—Each Congressional District and Territory, also the District of Columbia, is entitled to have one cadet at the United States Military Academy at West Point, the cadet to be named by the representative in Congress. There are also ten appointments at large, specially conferred by the President of the United States. The number of students is thus limited to 344. The course of instruction, which is quite thorough, requires four years, and is largely mathematical and professional. The discipline is very strict—even more so than in the army—and the enforcement of penalties for offenses is inflexible rather than severe. Academic duties begin September 1st and continue until June 1st. From the middle of June to the end of August cadets live in camps, engaged only in military duties, and receiving practical military instruction. Cadets are allowed but one leave of absence during the four years' course, and this is granted at the expiration of the second year. The pay of a cadet is \$540 a year. Upon graduation, cadets are commissioned as second lieutenants in the United States Army.

Music.—The cradle of music was Egypt. The Hebrews took with them to Palestine the songs they had learned there, and many of the hymns of the early Christian Church were necessarily old Temple melodies. Ambrose, Archbishop of Milan (374), and after him Pope Gregory the Great (590), were the fathers of music in the Western Church. Harmonies were introduced in the ninth century; the present musical notation was invented by Guido Aretino (*d.* 1055); counterpoint was perfected by the Belgian Josquin Despres (*d.* 1521), and the Italian Palestrina (1555); and Italian opera was founded in 1600. The influence of the Italian school spread all over Europe; but in the sixteenth century England had a national school of her own, comprising such names as Tallis, Farrant, and Orlando Gibbons. Among the great composers of the seventeenth century were Monteverde in Italy, Lully in France, and Purcell in England. In the eighteenth century music made enormous advances, especially in Germany. Church music attained to its highest development under Bach, the oratorio under Handel (1685-1759), the opera under Mozart and Gluck,

and orchestral music under Haydn and Beethoven (1770-1827). The nineteenth century has been illustrated by such names as Mendelssohn, Weber, Meyerbeer, Auber, Schubert, Spohr, Schumann, Chopin, Rossini, Bellini, Verdi; and in England, Sterndale, Bennett, and Macfarren. Of the later German school

the chief exponents have been Wagner (1813-'83) and Liszt (*d.* 1886). Other leading composers are Gounod, in France; Boito, in Italy; Rubinstein and Brahms, in Germany; Dvorák, in Bohemia; Grieg, in Scandinavia, and Sullivan, Mackenzie, Stanford, and Cowen, in England.

The Salvation Army. The Salvation Army is a missionary organization set on foot in England by William Booth, who was called the "General" of the Army. The plan of operation is for a company to march about cities, towns, and villages, singing popular sacred songs and speaking between whiles for about five minutes. The Army has also a large number of religious periodicals and small books. Mr. Booth was a minister of the Methodist New Connexion, which he left in 1861 to begin "revivalistic services" in a tent in Whitechapel. In 1865 his little band of followers called themselves "The East London Christian Revival Society," afterwards changed to "The Christian Mission." In 1869 the Mission made expeditions to provincial towns. Lastly, in 1873, the name was changed to "The Salvation Army." Its literary organ, called *The Christian Mission*, first appeared monthly in 1874. In 1879 it was called *The Salvationist* and in the same year its title was changed into *The War Cry*. Its flag now flies in thirty-four countries or colonies, where, under the leadership of 11,149 men and women, whose lives are entirely given up to the work, 49,800 religious meetings are held every week. The Army has 27 weekly newspapers and 15 magazines, with a total annual circulation of 49,015,044. It has accumulated \$4,015,085 worth of property, pays rentals amounting to \$1,100,000 per annum for its meeting places, and has a total income from all sources of \$3,750,000. The Army literature is issued in 15 languages and services are held in 29 languages. The number of local officers, bandmen, and office employees is 28,540. The United States branch was established in 1880. There are now in

this country 536 corps and outposts and 1,487 officers, and 15,000 adherents. The value of the property held by the United States wing of the Army is \$175,000.

United States Naval Academy at Annapolis.—There are allowed at the Academy one naval cadet for each member or delegate of the United States House of Representatives, one for the District of Columbia, and ten at large. The appointment of cadets at large, and for the District of Columbia, is made by the President. The Secretary of the Navy, as soon after March 5 in each year as possible, must notify in writing each member and delegate of the House of Representatives of any vacancy that may exist in his district. The nomination of a candidate to fill the vacancy is made on the recommendation of the member or delegate, by the Secretary. Candidates must be actual residents of the districts from which they are nominated.

The course of naval cadets is six years, the last two of which are spent at sea. Candidates, at the time of their examination for admission, must not be under fifteen nor over twenty years of age, and physically sound, well formed, and of robust condition. They enter the Academy immediately after passing the prescribed examinations, and are required to sign articles binding themselves to serve in the United States Navy eight years (including the time of probation at the Naval Academy), unless sooner discharged. The pay of a naval cadet is five hundred dollars a year, beginning at the date of admission.

Appointments to fill all vacancies that occur during a year in the lower grades of the Line and Engineer Corps of the Navy and of the

Marine Corps are made from the naval cadets, graduates of the year, at the conclusion of their six years' course, in the order of merit as determined by the Academic Board of the Naval Academy. At least ten appointments from such graduates are made each year. Surplus graduates who do not receive such appointments are given a certificate of graduation, an honorable discharge, and one year's sea pay.

The Academy was founded in 1845, by the Hon. George Bancroft, Secretary of the Navy in the administration of President Polk. It was formally opened October 10th of that year, with Commander Franklin Buchanan as superintendent. During the civil war it was removed from Annapolis, Md., to Newport, R. I., but was returned to the former place in 1865. It is under the direct supervision of the Navy Department.

Royal Academy.

Shee; 1850, Sir Charles Eastlake; 1866, Sir Edwin Landseer, elected, declined, Sir Francis Grant; 1878, Sir Frederic Leighton (Lord Leighton); 1896, Sir John Everett Millais, Bart; 1896, Sir Edward John Poynter.

The Seven Bibles of the World are the Koran of the Mohammedans, the Eddas of the Scandinavians, the Try Pitikes of the Buddhists, the Five Kings of the Chinese, the Three Vedas of the Hindoos, the Zendavesta, and the Scriptures of the Christians. The Koran is the most recent of these seven Bibles, and not older than the seventh century of our era. It is a compound of quotations from the Old and New Testaments, the Talmud, and the Gospel of St. Barnabas. The Eddas of the Scandinavians were first published in the fourteenth century. The Pitikes of the Buddhists contain sublime morals and pure aspirations, and their author lived and died in the sixth century before Christ. There is nothing of excellence in these sacred books not found in the Bible. The sacred writings of the Chinese are called the Five Kings, king meaning web of cloth, or the warp that keeps the threads in their place. They contain the best

sayings of the best sages on the ethico-political duties of life. These sayings cannot be traced to a period higher than the eleventh century before Christ. The Three Vedas are the most ancient books of the Hindoos, and it is the opinion of Max Müller, Wilson, Johnson, and Whitney that they are not older than the eleventh century before Christ. The Zendavesta of the Persians is the grandest of all the sacred books, next to our Bible. Zoroaster, whose sayings it contains, was born in the twelfth century before Christ. Moses lived and wrote his Pentateuch in the fifteenth century before Christ, and therefore has a clear margin of three hundred years older than the most ancient of the sacred writings.

Nationality of the Popes.—The various nations of Europe are represented in the list of Popes as follows: English, 1; Dutch, 1; Swiss, 1; Portuguese, 1; African, 2; Austrian, 2; Spanish, 5; German, 6; Syrian, 8;

Greek, 14; French, 15; Italian, 197. Eleven Popes reigned over 20 years; 69, from 10 to 20; 57, from 5 to 10; and the reign of 116 was less than 5 years. The reign of Pius IX. was the longest of all, the only one exceeding 25 years. Pope Leo XIII. is the 258th Pontiff. The full number of the sacred college is 70, namely: cardinal bishops, 6; cardinal priests, 50; cardinal deacons, 14. At present there are 62 cardinals. The Roman Catholic hierarchy throughout the world, according to official returns published at Rome in 1884, consisted of 11 patriarchs, and 1,153 archbishops and bishops. Including 12 coadjutor or auxiliary bishops, the number of Roman Catholic archbishops and bishops now holding office in the British Empire is 134. The numbers of the clergy are approximate only.

William and Mary College was established at Williamsburg, Va., in 1693, and next to Harvard College is the oldest institution of learning in America. At its endowment it was placed under the patronage of the King and Queen of Great Britain. The trustees of the Hon. R. Doyle, the English philosopher, who left his personal estate for "charitable and pious uses," presented a great part of it to this college for the education of Indians. During the Revolutionary war the college lost most of its possessions, and its buildings were used by the French troops as a hospital. Among the noted men who were graduated from William and Mary, were Presidents Jefferson, Madison, and Monroe, Chief Justice Marshall, and General Scott.

Sculpture, the art of giving form and expression, by means of the chisel and other implements, to masses of stone or other hard substances, so as to represent figures of every description, animate and inanimate. It is generally thought that sculpture had its origin from idolatry, as it was found necessary to place before the people the images of their gods to enliven the fervor of their devotion. But to form conclusions concerning the rise and progress of the arts and sciences, without the aid of historical evidence, by analogies which are sometimes accidental, and often fanciful, is a mode of reasoning which, at best, must ever be liable to suspicion. In whatever country the earliest attempts were made, the Egyptians were the first who adopted a certain style of art. Their works were gloomy and grave, but still they were full of deep sentiment, and connected, as would appear by the hieroglyphics which covered them, with poetry and history, and by the mummies, with the belief of immortality. Interesting as the subject would doubtless prove, it is far beyond our limited means to trace the progress of this beautiful

art through all its stages in the classic days of Greece, till its decline in Rome, where, though all the treasures of the Grecian sculptors had been carried to deck the Roman capital, the art never became naturalized. During the long and gloomy interval of barbarism that succeeded the downfall of Imperial Rome, sculpture, with the sister arts, lay dormant and forgotten. At length, however, through the genius of Michael Angelo Buonarroti, and the skill and perseverance of some of his distinguished successors, seconded by the patronage of the illustrious house of Medici, the treasures of antiquity were collected, and modern art nobly tried to rival the grace and sublimity which existed in the ancient models. Though till within the last century it could hardly be said that a British school of sculpture existed, yet the talent that has been successfully called into action has produced many works of sterling merit. The names of Flaxman, Chantrey, Baily, and Westmacott, are alone sufficient to redeem the national character in this department of art. In the United States, the productions of Greenough, Powers, and other distinguished artists, have been received with admiration by the most fastidious connoisseurs. The very essence of sculpture is correctness; and when to correct and perfect form is added the ornament of grace, dignity of character, and appropriate expression, as in the Apollo, the Venus, the Laocoön, the Moses of Michael Angelo, and many others, this art may be said to have accomplished its purpose.

SCHOOLS OF ART.

Certain modes of drawing and painting, followed by pupils of a great master, have led to the foundation of well defined "schools" of painters, since the revival of the Art among the Byzantine and Tuscan painters of the thirteenth and fourteenth centuries, which diverged into the Florentine and Genoese schools (Cimabue and Giotto taking the head of the former), and the schools of Umbria and Bologna. The fifteenth century was the great period of artistic development, whence we may trace modern excellence, commencing with the Florentine School, at the head of which were Fiesole and Masaccio. This school diverged into the different styles, consisting of—1. Such as studied exact natural truth, and whose first exponent was Ghirlandajo; 2. Such as combined therewith a species of poetic treatment, as Fra Filippo Lippi, Sandro Botticelli, and Benozzo Gozzoli; 3. Such as adopted a sculpturesque treatment of the figure, as seen in works of Andrea del Castagno, Antonio Pollajuolo, and Andrea Verocchio. During the first half of the sixteenth century, this school

was adorned by the genius of Leonardo da Vinci and Michael Angelo.

The Roman School (into which that Bologna Romagna merged) is the most important for its solid and legitimate effect; a result which may be attributed to the purity of study and delicacy of feeling engendered by its great head, Raffaello Sanzio d'Urbino, followed out by Giulio Romano, Mazzolina di Ferrara, Zuccherro, Baroccio, Carlo Maratti, and others.

The Venetian School gloried in its color, and the magic pencil of Titian gave it a position for which Giorgione and Sebastian del Piobzino had but prepared it. The pupils and successors of him who "dipped his pencil in the rainbow," viz. Bonifazio, Bordone, Tintoretto, Paul Veronese, Bassano, Garofalo, and others, followed in his footsteps, and gave this school a European renown.

The Lombard School, also known as that of the Eclectics, was established by the Caracci, the principles of which have been explained by Agostino in a sonnet of his own composing, which may be thus translated: "Adopt the design of the Romans, with the color of the Lombard school, adding the motion and shade of that of Venice. Join the just symmetry of Raphael with the power of Michael Angelo, the purity of Correggio, the truth of Titian, the decorum and solidity of Tebaldi, the learned invention of Primaticcio, and a little of Parmigiano's grace." To this school belong Correggio and Parmigiano, and such were the painters from whom the Caracci were induced to select the qualities of the Eclectic style; "for Agostino and Annibal were, at the commencement of their career, unacquainted with the works of the originators of the beauties which they professed to imitate. Before opening their celebrated school, however, they visited Parma and Venice, and became familiar with the works of Correggio and Titian; but it was only mediately, through the works of the masters above mentioned, that they could demonstrate their principles to their scholars. The St. Cecilia of Raphael was not, and could not have been, taken as a standard of that great master. Lodovico is the real founder of the Bolognese school; he was the guide and instructor of his cousins, who were some years his juniors." Their style of proceeding in "making up" a painter according to their own recipe above given, has been severely commented upon by Fuseli in the eleventh lecture. Certainly with the age of the Macchinisti began the decadence of that great and pure Art revived again by the genius of Raphael; and a meretricious and untrue style, in which the dictum of the school took the place of the

teachings of nature, and led to the adoption of individual whims, which, following so rapidly one upon another, caused the school to sink from Guido Reni, and Guercino, to Giordano. Nicolas Poussin endeavored to prop its fall by a reversion to the purer principles of classic Art; but neither his genius, nor that of the men who had ranked themselves as opposers of the school under the name of Naturalists, could prevent the decay of Italian Art. "This decline resulted with many painters from a light and pleasing but superficial invention, accompanied by a corresponding skillful but decorative treatment; in others, it proceeded from a close but spiritless adherence to a set of obsolete rules, which destroyed the peculiarity of individuals as well as of schools. With few exceptions, sound technical science, as the basis of manipulation in painting, was lost."

The German School may be said to have originated with the versatile genius of Albert Durer, and was followed by Lucas van Leyden, Holbein, Netscher, Mengs and others. It was remarkable for a strict adherence to nature, and for much power of drawing, qualifications which still remain the chief characteristics of its modern disciples, under Cornelius, Kaulbach, and Overbeck.

The Flemish School combines with German after the middle of the sixteenth century. Its early history begins with the Van Eycks, who have given to the world a school of their own in Roger of Bruges, Hans Hemling, Jan Mabuse, and Quentin Matsys. Its great glories center in Rubens and Vandyke; their works are remarkable for brilliance of color, exactness of drawing, and great command of chiaro-oscuro; but Rubens wants grace, and in founding his style on nature, relying on his power of exhibiting her as he saw her, he frequently lacks dignity. Teniers excelled in arrangement and harmony, though he very frequently lost his proper position in the lowness of his subjects. Steinwick, Spranger, Snyders, Neeffs, and others, may be particularized as among the remarkable men of a school which may be considered as the legitimate descendant of the Venetian school of colorists.

The Dutch School is even lower in refinement; but the great genius displayed by its principal painter, Rembrandt, elevated it into importance. His marvelous power over light and shade was what the world had never before seen, and it has died with him who first exhibited it. It was too much the fault of this school to select the vulgarest scenes of life for the employment of the pencil; thus we find great power of drawing, coloring, and a perfect mastery of the mechanism of Art, combined with high artistic feeling, devoted to

some unworthy subject, which no genius can redeem, and which but excites a feeling of regret to see talent so misdirected. Ostade, Gerard Dow, the two Breughels, Karel du Jardin, Pieter Laer (called Bamboccio), Jan Lingelbach, Nicolas Maas, Gabriel Metz, Frans van Mieris, Eglon van der Neer, Gaspar Netscher, Cornelius Poolemburg, Paul Potter, Godfried Schalken, Pieter van Slingeland, Jan Steen, Gerard Terburg, and Philip Wouverman may be named as the principal exponents of the power of this school. Of the landscape and marine painters of the same period, the following were the principal: Ludolph Bakhuizen, Nicolas Berghem, Jan and Andries Both, Albert Cuyp, Simon van der Does, Jan van Goyen, Aart van der Neer, Jacob Ruisdal, Mindert Hobbema, Herman Swanevelde, Adam Pynacker, Adrian, and the two Williams Vandervelde, and Antony Waterloo. Of architectural painters: G. Hoekgeest, Jan van der Heyden, Pieter Neefs, Hendrik van Vliet, and Hendrik van Steenwyck. Of painters of birds, still life, fruit, flowers, etc., the following: Jan Davidz de Heem, Melchior de Hondelooster, Jan van Huysum, Rachel Ruysch, Jan Weenix, Jan Wynants, Adrian van Utrecht, and Willem Kalf.

The Spanish School, while it possesses great power, has for its characteristics a certain gloom and wildness belonging to the national mind. This peculiar school of painting appears to have been one of the more recently established of the modern schools of Europe; in its prevailing characteristics, it exhibits a close connection with some of the schools of Italy, especially those of Venice and Naples, though its earlier development seems to have been due to the immigration of Flemish artists into Spain. The principal works undertaken in Spain date from the time of Philip II.; they were chiefly executed by Italians, and the principal Spanish painters studied in Italy. Titian spent a few years in Spain in the reign of Charles V.; but the works he executed were oil pictures, and chiefly easel pieces, which, though guides in coloring to the Spanish painters, were less the models of the great masters of Spain than those executed in Philip's time. The painters of Spain have been classified into three principal schools, but these divisions are as much local as characteristic; they are those of Valencia, Madrid, and Seville. The following are the principal masters of these several schools, with the names of the places where they chiefly resided, and worked, arranged chronologically, from the sixteenth century, inclusive; Of the sixteenth: Antonio del Rincon, Toledo; Alonso Berruguete, Castile and Toledo; Luis de Vargas,

Seville; Alonso Sanchez Coello, Madrid; Luis de Morales, el Divino, Badajoz; Dominico Theotocopuli, el Greco, Toledo; Vicente Joanes, Valencia; Miguel Barrosa, Escorial and Toledo; and Alonso Vazquez, Seville. Of the seventeenth century: Pablo de Cespedes, Cordova and Seville; Juan de las Roelas, Seville; Francisco de Ribalta, Valencia; Juan del Castillo, Seville; Francisco Pacheco, Seville; Alonso Cano, Andalusia and Madrid; Antonia de Pereda, Madrid; Diego Velasquez, Madrid; Juan de Pereja, Madrid; Francisco Zurbaran, Seville and Madrid; Francisco Rizi, Madrid; Claudio Coello, Madrid and Zaragoza; Juan de Valdes Leal, Madrid; Antonio Palomino y Velasco (the Spanish Vasari), Cordova; Bartolome Esteban Murillo, Seville; and Francisco de Herrera, el Mozo (the Young), Madrid and Seville. This list comprises all the great painters of Spain; there were no very distinguished Spanish masters in the eighteenth century. The following are the most distinguished of those above mentioned: Antonio del Rincon, Luis de Vargas, Morales, Joanes, Cespedes, Roelas, Ribalta, Pacheco, Alonso Cano, Velasquez, Zurbaran, and Murillo.

The French School of painting was, until the latter part of the eighteenth century, in all respects a branch of the schools of Italy. The earliest mature development dates from the reign of Francis I., who employed many distinguished Italian artists in France; and what is termed the French school arose from the examples left by these Italians at Fontainebleau. The masters who engrafted the Italian principles of art among the French were Il Rosso, Primaticcio, and Niccolo dell'Abate. The earliest French painters of distinction, and the only two who cannot be said to belong to this Italianized school of the sixteenth century, were Jean Cousin and François Clouet, called Jeannet, who belonged to what is termed the Gothic school, and painted in the manner of the Italian quattrocentisti. The three greatest names in French art are Claude Lorraine, Nicolas Poussin, and Anthony Watteau. Le Brun, Le Sueur, Dufresnoy, Jouvenet, and others, can but be considered as the people of a transition period, whose works picture the taste of an age, rather than the exposition of true art. It was with J. L. David that a new era commenced in art, which may possibly have been generated by the revived classicalities of a revolutionary mania which convulsed France. The Greek ideal of a monumental kind was adopted by him for historic painting, and has been happily characterized as "a morbid imitation of the antique." He was followed in his stiff insipidities by Gros, Girodet, and Guerin; but nature again appealed

to the world in the work of Guérin's celebrated pupil, Gericault, whose "Wreck of the Medusa" appalled by its truth to nature and power in art. Leopold Robert followed in the same track, and produced some remarkable and life-like scenes. Paul Delaroche, took up his wondrous pencil, to delineate history with the power of a genius and the truthfulness of a historian, and nature again appeared on the walls of the French exhibition rooms. No painters excel the modern French school in history; but in landscape they are inferior to those of England and Belgium.

The English School is the youngest of the cycle of Arts; but its youthful vigor has given it a wondrous position in a comparatively short time. The first great native genius, who neither copied in a school nor followed its rules, — who struck out his own path, in which he has hitherto been alone, and whose thoughts, subjects, and sympathies were all essentially English, — was William Hogarth. "Hogarth," says Walpole, "had no model to follow and improve upon. He created his art, and used colors instead of language. His place is between the Italians, whom we consider as epic poets and tragedians, and the Flemish painters, who are as writers of farce and editors of burlesque nature." Hogarth's was the period of the revival of painting in England in every department of the art; the hitherto brightest names in the annals of English painting were his contemporaries — Sir Joshua Reynolds, Gainsborough, Wilson, West, Romney, Cotes, Cosway, Barry, and Mortimer; to whom may be added the foreigners — De Louthembourg, Zoffany, Cipriani, Moser, and Fuseli, all domiciliated in England. Toward the end of the century, the most conspicuous masters in the department of history were — Opie, Northcote, Westall, Copley, Harlow, Hilton, and others; in portrait — Sir T. Lawrence, Hoppner, Jackson, and Raeburn; in genre — Wilkie, Bird, Smirke, and Newton; and in landscape — Constable, Callcott, and Collins.

The American School has been more or less influenced by the French, and has not yet attained to the distinction of independent characteristics. The most noted names are: Malbone (1777-1807), Copley (1738-1815), C. W. Peale (1741-1827), Gilbert C. Stuart (1756-1828), J. Trumbull (1756-1843), W. Allston (1779-1848), Thomas Cole (1801-48), Rembrandt Peale (1778-1860), W. M. Hunt (1824-79), W. Page (1811-85), D. Huntington (1816), S. R. Gifford (1823-80), Eastman Johnson (1824), Elihu Vedder (1836), Bierstadt (1830).

Russian art, dormant since the Byzantine

period, has during the last forty years produced Swedomaky Verestchagin (1842), and Kramskoë.

Scandinavian art has been represented in modern times by Uhde, and Edelfeldt.

Pyramids.—The great pyramid of Gizeh is the largest structure of any kind ever erected by the hand of man. Its original dimensions at the base were 764 feet square, and its perpendicular height in the highest point is 488 feet; it covers four acres, one rood and twenty-two perches of ground, and has been estimated by an eminent English architect to have cost not less than £80,000,000, which in United States currency would be about \$145,200,000. Internal evidences prove that the great pyramid was begun about the year 2170 B. C., about the time of the birth of Abraham. It is estimated that about 5,000,000 tons of hewn stones were used in its construction.

Sphinx.—The word sphinx is from the Greek and means the strangler, and was applied to a fabled creature of the Egyptians, which had the body of a lion, the head of a man or an animal, and two wings attached to its sides. In the Egyptian hieroglyphs the sphinx symbolized wisdom and power united. It has been supposed that the fact that the overflow of the Nile occurred when the sun was in the constellations Leo and Virgo gave the idea of the combinations of form in the sphinx, but this idea seems quite unfounded. In Egypt the reigning monarch was usually represented in the form of a sphinx. The most remarkable sphinx is that near the pyramids at Gizeh. It is sculptured from the rock, masonry having been added in several places to complete the form. It is 172½ feet long by 53 feet high, but only the head of this remarkable sculpture can now be seen, the rest of the form having been concealed by the heaped up sands of the desert.

Obelisks.—The oldest of all the obelisks is the beautiful one of rosy granite which stands alone among the green fields upon the banks of the Nile, not far from Cairo. It is the gravestone of a great ancient city which has vanished and left only this relic behind. The city was the Bethshemesh of the Scriptures, the famous On, which is memorable to all Bible readers as the residence of the priest of Potipherah, whose daughter, Asenath, Joseph married. The Greeks called it Heliopolis.

Cleopatra's Needle.—The two obelisks known as Cleopatra's Needles were set up at the entrance of the Temple of the Sun, in Heliopolis, Egypt, by Thothmes III., about 1831 B. C. We have no means of knowing when they were built, or by whom, except

from the inscriptions on them, which indicate the above time. The material of which they were cut is granite, brought from Syene, near the first cataract of the Nile. Two centuries after their erection Rameses II. had the stones nearly covered with carving setting out his own greatness and achievements. Twenty-three years before Christ, Augustus Cæsar moved the obelisks from Heliopolis to Alexandria and set them up in the Cæsarium, a palace, which now stands, a mere mass of ruins, near the station of the railroad to Cairo. In 1819 one of these obelisks was presented by the Egyptian government to England, but, as no one knew how to move them, it was not taken to London until 1878. Subsequently the other obelisk was presented to the United States.

Parthenon, a celebrated temple at Athens, on the summit of the Acropolis, and sacred to Minerva. The Parthenon in beauty and grandeur surpassed all other buildings of the kind, and was constructed entirely of Pentelic marble. It was built during the splendid era of Pericles, and the expense of its erection was estimated at 6,000 talents. It contained innumerable statues raised upon marble pedestals, and other works of art. The colossal statue of Minerva, which was in the eastern end of the temple, was thirty-nine feet high, and was composed of ivory and gold, the value of the latter being forty-four talents, or about \$485,000. The temple was reduced to ruins in 1687. A part of the matchless friezes, statues, etc., of the Parthenon now form the most valuable and interesting portion of the British Museum, they having been taken from the temple by Lord Elgin in 1800, and by him sold to the British Government.

German Philosophers.—Leibnitz, the founder of modern German philosophy, was a marvelous specimen of precocious genius, his first philosophical treatise being written at the age of seventeen. His system of philosophy supposed the mind and body to be two distinct machines, acting independently of but in harmony with each other. He also held to the theory of "monads"—that is, the indestructible entities of matter and of mind—claiming the Deity to be the prime monad, and asserted that all ideas were innate. He lived from 1646 to 1716. The great opponent of Leibnitz was Christian Wolf, who founded all his philosophy on logical propositions, and set aside those very doctrines on which Leibnitz grounded all his reasoning. After these two philosophers had passed away there was a term of quiescence in German philosophy, broken by the teachings of Emanuel Kant, the philosopher of "Pure Reason," and the father

of modern philosophical criticism. The central point of his system lies in the proposition that before we can know anything concerning objects we must understand how we perceive objects, and what degree of knowledge perception can give us. Fichte was a disciple of Kant, but went beyond his master in transforming all knowledge into pure idealism. Schelling was the next writer to gain a general influence. He was at first simply an expounder of Fichte, but gradually developed a philosophy of his own, founded on the theory that the true sources of knowledge are not experience or reflection, but intellectual intuition. Hegel, who succeeded Schelling as the leader in German philosophy, was a more vigorous and logical thinker. The foundation of his system is that the union of assertion and negation, the harmonizing of every proposition with its contradictory, is the source of all knowledge. The Hegelian system has been modified largely by the speculations of Schleiermacher, Schubert, and others, but it still remains the most powerful school of German philosophy. The principal opposing system is that of Schopenhauer, whose fundamental doctrine is that the only essential reality in the universe is *will*, all phenomena being but manifestations of the single original will.

Classification of Mankind.—In regard to religion, mankind may be divided into two general classes: *Monotheistic*, those who worship one god, and *polytheistic*, those who worship more than one god, also called pagans, or heathen. Of the first class we have: (1) the *Christian*, which recognizes the Bible as the revealed word of God, and Jesus Christ as the Son of God; (2) the *Jewish*, which recognizes the Old Testament as the word of God, but does not acknowledge Christ; (3) the *Mohammedan*, or the religion of *Islam*, whose two articles of faith are, "There is no god but God, and Mohammed is the prophet of God."

Of the second class there are: (1) *Brahminism*, or *Hindooism*, the religion of the people of India, a very ancient religion which has many good moral doctrines, but strange ideas of a future state; (2) *Buddhism*, an offshoot of Brahminism, now practiced by the people of China and Japan, founded by Sakya-Muni, who adopted the title of Buddha (the enlightened), a religion which has been more enthusiastic in making converts than any other, except Christianity, and has many good moral precepts, but is practically atheistic; (3) *Fetichism*, a very low form of superstition, which consists in the worship of material objects, either living or dead, as animals or idols of wood or stone.

In regard to general culture and intelligence, mankind may be divided into: (1) *Savages*, those who are scarcely elevated above the brutes, live in tribes, and subsist by hunting and fishing; (2) *Barbarians*, those who have possessions, as flocks and herds, and practice agriculture to some extent, yet have made no progress in arts and sciences; (3) *Half-civilized*, those who have made some progress in the arts, have towns and cities, but depend chiefly upon agriculture; (4) *Civilized*, those who have made considerable progress in science and art, engage in commerce, and have a written language; (5) *Enlightened*, those who stand at the head of the scale, have a division of labor, systems of education, and have made the greatest progress in science, art, and in morality.

The Jewish Religion.—In their religious observances modern Jews adhere to the rules of the Mosaic dispensation. Their service consists chiefly in reading the law in their synagogues, together with a variety of prayers. They abstain from the meats prohibited by the Levitical law, and they continue to observe the ceremonies of the Passover, as nearly as possible. They offer prayers for the dead, because they believe that the souls of the wicked go to a place of temporary punishment, where they remain under trial a year, and they think that very few will be condemned to suffer eternally. We give a summary of the confession of faith, in which all orthodox Jews must live and die. It is made up of thirteen articles, and was drawn up in the eleventh century by a celebrated rabbi named Maimonides. These articles declare in substance: (1) That there is one God, creator of all things, who may exist without any part of the universe, but without whom nothing can maintain existence; (2) that God is uncompounded and indivisible, but different from all other unities; (3) that God is an immaterial being, without any admixture of corporeal substance; (4) that God is eternal, but everything else had a beginning in time; (5) that God alone ought to be worshiped, without mediators or intercessors; (6) that there have been inspired prophets, and may be more; (7) that Moses was the grandest prophet that ever appeared; (8) that the law of Moses was, in every syllable, dictated by the Almighty, not only in its written letter, but in traditionary exposition; (9) that this law is immutable, neither to be added to nor diminished; (10) that God knows all our actions and governs them as He will; (11) that the observance of the law is rewarded and its violation punished in this world, but in a greater degree in the next; (12) that a Messiah is yet to appear, the time of whose coming may not be prescribed or

foretold; and (13) that God will raise the dead at the last day and pass judgment upon all.

Quakers.—The Society of Friends or Quakers was founded in 1646, by George Fox, a shoemaker of Drayton, in Leicestershire. They believe in the main fundamental principles of what is called "Orthodox Christianity," but they express their religious creed in the very words of the New Testament Scripture, and each member has the liberty of interpreting the words. Their main specialty is the belief of "The Light of Christ in man," and hence they entertain a broader view of the Spirit's influence than other Christians. In morals, propriety of conduct, good order, and philanthropy, the Quakers are a pattern society.

The Peabody Education Fund.—In 1867 and 1869 George Peabody established a fund of \$3,500,000 to be devoted to education in the Southern states of the Union. Unfortunately, \$1,880,000 of this amount was in Mississippi and Florida bonds, which those states have repudiated. The fund was placed in the charge and control of fifteen trustees, of which the Hon. Robert C. Winthrop of Massachusetts was the chairman. Mr. Peabody died in London in 1869. The trustees hold meetings annually, usually in New York. They fill vacancies caused by death or resignation. The present trustees are: Chief Justice Fuller, who is president of the board; Hon. Joseph H. Choate, first vice-president; D. C. Gilman, LL.D., president of the Carnegie Institution, second vice-president; Hon. Jabez L. M. Curry, LL.D., general agent; Hon. Seth Low, mayor of New York; J. Pierpont Morgan, of New York; President Theodore Roosevelt, of New York; Samuel A. Green, Hon. Richard Olney and Hon. George F. Hoar, of Massachusetts; William Wirt Henry, of Virginia; ex-Mayor William A. Courtenay, of South Carolina; James D. Porter, of Tennessee; Henderson M. Somerville, of New York; George Peabody Wetmore, of Rhode Island; Charles E. Fenner, of Louisiana, and Hon. Hoke Smith, of Georgia. Dr. Curry is general agent of the fund, with headquarters at Washington, D. C., and has charge of the distribution of the fund in the several Southern States. In its earlier history the chief aim of the fund was to encourage and secure the establishment of public school systems for the free education of all children. That having been accomplished, the income of the fund is now used for the training of teachers through normal schools and teachers' institutes. At its session in October, 1896, the board declared it to be in-

expedient to close the Trust in February, 1897, the power to do which was left to its discretion. In the thirty years since the organization of the trust, over \$2,500,509 have been spent, as the income of the sum left by Mr. Peabody. Mr. J. Pierpont Morgan is the treasurer.

The John F. Slater Fund.—In 1882 Mr. John F. Slater, of Connecticut, placed in the hands of trustees the sum of \$1,000,000, for the purpose of "uplifting the lately emancipated population of the Southern states and their posterity." For this patriotic and munificent gift the thanks of Congress were voted, and a medal was presented. Neither principal nor income is expended for land or buildings. Education in industries and the preparation of teachers are promoted in institutions believed to be on a permanent basis.

The board consists of D. C. Gilman, of Johns Hopkins University, as president; Chief Justice Fuller, as vice-president; Morris K. Jesup, as treasurer; J. L. M. Curry, as secretary and general manager, and Bishops Potter and Galloway, and Messrs. William E. Dodge, William A. Slater, John A. Stewart, Alexander E. Orr, ex-Governor Northen, and Wm. L. Wilson. The fund is a potential agency in working out the problem of the education of the negro, and over half a million dollars has already been expended. Schools established by states, denominations, and individuals are helped by annual donations. Among the most prominent are the Hampton Normal and Industrial, the Spelman, the Tuskegee, and schools at Orangeburg, S. C., Tougaloo, Miss., Marshall, Tex., the Meharry Medical College at Nashville, Tenn., etc.

National Academy of Design.

COUNCIL, 1902-1903.

President, Frederick Dielman; Vice-President, C. T. Turner; Corresponding Secretary, H. W. Watrous; Recording Secretary, Will. H. Low; Treasurer, Lockwood De Forest; H. Bolton Jones, J. W. Alexander, Herbert Adams, F. D. Millet, Kenyon Cox.

NATIONAL ACADEMICIANS.

Elected.

1902. Abbey, Edwin A., Fairfield, England.
1899. Adams, Herbert, 42 West 15th Street.
1904. Alexander, J. W., 123 East 63d Street.
1900. Barse, G. R., Jr., 11 East 59th Street.
1902. Beaux, Cecelia, 64 Washington Square South.
1894. Beckwith, J. Carroll, 58 West 57th Street.
1903. Bitter, Karl, Weehawken, N. J.
1888. Blashfield, Edwin H., 48 West 59th Street.
1871. Boughton, George H., London, England.
1872. Brandt, Carl L., Hastings-on-Hudson, N. Y.
1863. Brevoort, J. R., 32 East 23d Street.
1881. Bridgman, Frederick A., Paris, France.
1875. Bristol, John B., 52 East 23d Street.
1863. Brown, J. G., 51 West 10th Street.
1873. Butler, George B., 116 West 88th Street.
1899. Butler, Howard R., Carnegie Hall.
1875. Calverley, Charles, 107 East 27th Street.
1890. Chase, William M., 303 Fifth Avenue.
1885. Church, F. S., 1512 Broadway.
1898. Clinedinst, B. West, 1900 Madison Avenue.
1862. Colman, Samuel, 37 Central Park West.
1903. Cox, Kenyon, 145 West 55th Street.
1901. Crane, Bruce, 154 West 55th Street.
1904. Curran, C. C., 16 West 61st Street.
1863. Dana, W. P. W., London, England.
1898. De Forest, Lockwood, 7 East 10th Street.
1888. Dewing, Thos. W., 51 West 10th Street.
1883. Dielman, Frederick, 51 West 10th Street.
1902. Eakins, Thos., 1729 Mt. Vernon St., Philadelphia.
1904. Foster, Ben., 253 West 42d Street.
1900. Fowler, Frank, 106 West 55th Street.
1901. French, Daniel C., 125 West 11th Street.
1882. Gaul, Gilbert, 51 West 10th Street.
1867. Griswold, O. C., 262 West 12th Street.
1865. Guy, Seymour Joseph, 51 West 10th Street.
1868. Hall, George Henry, abroad.
1889. Hamilton, Hamilton, Peekskill, N. Y.
1901. Harrison, Alexander, 118 East 40th Street.
1891. Hartley, J. S., 145 West 55th Street.
1863. Hennessy, W. J., London, England.
1849. Henry, E. L., 7 West 43d Street.
1865. Homer, Winslow, Scarborough, Me.
1897. Howe, Wm. H., Bronxville, N. Y.
1882. Howland, Alfred C., 318 West 57th Street.
1840. Huntington, Daniel, 49 East 20th Street.
1899. Inness, George, Jr., Carnegie Hall.
1861. Johnson, David, 69 West 131st Street.
1860. Johnson, Eastman, 65 West 55th Street.
1894. Jones, Francis C., 253 West 42d Street.

Elected.

1883. Jones, H. Bolton, 253 West 42d Street.
1869. La Farge, John, 51 West 10th Street.
1897. Lippincott, Wm. H., 37 West 22d Street.
1890. Low, Wm. H., Bronxville, N. Y.
1878. Magrath, William, 11 East 14th Street.
1885. Maynard, George W., 156 East 36th Street.
1875. Miller, Charles H., 10 East 23d Street.
1885. Millet, F. D., 6 East 23d Street.
1896. Moeller Louis, Wakefield, N. Y.
1884. Moran, Thomas, 24 West 22d Street.
1891. Mowbray, H. Siddons, 66 West 11th Street.
1887. Murphy, J. Francis, 222 West 23d Street.
1870. Nehlig, Victor, Paris, France.
1885. Nicoll, J. C., 51 West 10th Street.
1904. Ochtman, Leonard, Cos Cob, Ct.
1897. Palmer, Walter L., Albany, N. Y.
1884. Parton, Arthur, 318 West 57th Street.
1869. Perry, E. Wood, abroad.
1880. Porter, Benjamin C., 3 North Washington Square.
1904. Proctor, A. Phimister, 1921 Broadway.
1878. Robbins, Horace Wolcott, 56 East 57th Street.
1897. Sargent, John S., 33 Tite Street, London, Eng.
1875. Sellstedt, L. G., Buffalo, N. Y.
1861. Shattuck, Aaron D., Granby, Ct.
1888. Shirlaw, Walter, abroad.
1890. Shurtleff, R. M., 44 West 22d Street.
1882. Smillie, George H., 156 East 36th Street.
1876. Smillie, James D., 156 East 36th Street.
1889. St. Gaudens, Augustus, Windsor, Vt.
1858. Tait, Arthur F., Yonkers, N. Y.
1901. Thayer, Abbott H., Monadnock, N. H.
1880. Tiffany, Louis C., 335 Fourth Avenue.
1891. Tryon, D. W., 226 West 59th Street.
1886. Turner, O. Y., 35 West 14th Street.
1865. Vedder, Elihu, 7 West 43d Street.
1891. Vinton, Frederic P., Boston, Mass.
1899. Volk, Douglas, Centre Lovell, Me.
1902. Walker, Henry O., Lakewood, N. J.
1891. Walker, Horatio, Beaulieu, Canada.
1883. Ward, Edgar M., 51 West 10th Street.
1863. Ward, J. Q. A., 119 West 52d Street.
1895. Watrous, Harry W., 58 West 57th Street.
1886. Weir, J. Alden, 146 West 55th Street.
1866. Weir, John F., New Haven, Ct.
1897. Weldon, C. D., 51 West 10th Street.
1861. Whittredge, Worthington, Summit, N. J.
1898. Wiles, Irving E., 106 West 55th Street.
1873. Willmarth, L. E., Brooklyn, N. Y.
1880. Yewell, George H., 51 West 10th Street.

The addresses of members given in the list refer to the city of New York when not otherwise specified.

University Extension has for its object the provision of "the means of higher education for persons of all classes, and of both sexes engaged in the regular occupations of life." This movement commenced with the University of Cambridge in 1872, and was subsequently taken up by Oxford University, the London Society for the extension of University Teaching, Dublin University, Owens College, Manchester, the Scottish Universities, the University of Sydney, New South Wales, and the Chautauqua Home Reading Club in the United States. In 1890 Cambridge, Oxford, and the London Society had two hundred and twenty-seven centers, seventy-nine lecturers, and 40,336 students attending lectures. The lecture study system was organized in the United States at the University of Pennsylvania. Other institutions, notably the University of Chicago and the University of Wisconsin, have engaged in the work, and many centers for lectures and study in history, science, art, and literature have been formed.

Columbian University, Washington, D. C., originated with the Rev. Luther Rice, who, in 1819, with a number of associates, paid \$7,000 for a tract of land adjoining the city of Washington, with the understanding that it should be held for higher educational purposes. John Quincy Adams, John C. Calhoun, thirty-two members of Congress, and leading citizens of Washington, were among the contributors to this fund. A charter was procured from Congress in February, 1821, during the presidency of James Monroe, "erecting the Columbian College in the District of Columbia." The construction of a college building had been commenced in 1820, and it was completed in 1822, at a cost of \$35,000. Dr. Stoughton, a native of England, and an eminent pulpit orator, was the first president of the institution. Agents were sent to Europe, and among the contributors to the founding of the college were several Englishmen prominent in politics and literature, including the chancellor of the exchequer and Sir James Mackintosh, the historian.

The first commencement of the college was held December 15, 1824, and was attended by the President of the United States and members of both Houses of Congress and General Lafayette; a formal address of welcome being made to General Lafayette by the president of the college. Upon the conclusion of the exercises, General Lafayette and his suite, Secretary John Quincy Adams, Secretary John C. Calhoun, Henry Clay, and other distinguished citizens dined with the faculty and board of trustees at the house of President Stoughton.

Dr. Stoughton resigned the presidency in

1827, after a rather stormy period, during which the college was at times greatly embarrassed for money, and in 1828 Rev. Steven Chapin, D.D., was chosen his successor. The presidents since that time have been: Rev. Joel S. Bacon, D.D., elected 1843; Rev. Joseph G. Binney, D.D., elected 1855; Rev. George W. Samson, D.D., elected 1859; James C. Welling, LL.D., elected 1871; Benaiah L. Whitman, M.A., D.D., LL.D., elected 1895; Charles W. Needham, LL.D.

In 1873, Congress passed an act providing that the corporation "shall hereafter be known and called by the name of the Columbian University." In 1879 it was decided to remove all departments of the University into the heart of Washington, and in 1884 the present university buildings, at the corner of 15th and H streets, were occupied by the academic, law, and scientific schools of the University.

John Quincy Adams was among the earliest friends of the college to lend aid during its periods of financial need. He loaned it \$18,000, a part of which debt he remitted. From 1835 to 1861 John Withers of Virginia made frequent gifts to cancel debts, to repair buildings, and for general purposes, amounting in the aggregate to nearly \$70,000. In 1865 William W. Corcoran presented the college with a building for its Medical School, valued at \$30,000. His subsequent gifts have reached about \$150,000, in grateful memory of which was established, in 1884, the Corcoran Scientific School.

The University comprises the following divisions: The Columbian College, the Corcoran Scientific School, the School of Graduate Studies, the Law School, the School of Jurisprudence and Diplomacy, the Medical School, the Dental School, the Graduate Veterinary School, and the Summer School.

In 1898, as an organic part of the University, there was established a School of Comparative Jurisprudence and Diplomacy, the first of that character in the United States. Such a school had been a long cherished hope of the University authorities, and owed its germinal conception to a former president of the University, James Clarke Welling, LL.D. The design of the school is to afford a training in the subjects of higher legal knowledge, comparative government, applied economics, and the history, science, and practice of diplomacy. Two courses are now given, leading respectively to the degrees Doctor of Civil Law (D. C. L.) and Master of Diplomacy (M. Dip.), depending upon the emphasis awarded to jurisprudence or diplomatic studies. The lecturers, together with their assignment of subjects, are as follows:—

Charles W. Needham, LL.D., *President; Transportation and Interstate Commerce Law.*

Henry St. George Tucker, LL.D., *Dean; International Private Law.*

Hon. John M. Harlan, LL.D., *Comparative Constitutional Law.*

Hon. David J. Brewer, LL.D., *International Public Law.*

Hon. John W. Foster, LL.D., *American Diplomacy and Treaties.*

Hon. David Jayne Hill, LL.D., *European Diplomacy and Treaties.*

Hon. William Wirt Howe, LL.D., *Ancient, Roman, Mediæval Law; Modern Civil Law.*

Hon. Hannis Taylor, LL.D., *Constitutional and Common Law of England.*

Hon. Martin A. Knapp, LL.D., *Interstate Commerce Law.*

Hon. Carroll D. Wright, LL.D., *Social Economics and Statistics.*

Charles C. Swisher, PH.D., L.H.D., *Comparative Politics and Political Geography.*

Hon. Lyman J. Gage, LL.D., *Public Finance.*

John F. Crowell, PH.D., L.H.D., *International Trade.*

Hon. Edward H. Strobel, M.A., LL.B., *Jurisprudence of France and Spain.*

N. W. Hoyles, K.C., LL.D., *Jurisprudence of Canada.*

Special lectures are provided upon the Jurisprudence of England, France, Germany, Austria-Hungary, and Italy, who are authorities in their respective subjects.

Greek Church, The, in its widest sense, comprehends all Christians following the Greek or Greco-Slavonic rite, who receive the first seven General Councils, but reject the authority of the Roman pontiff and the later councils of the Western church. The Greek Church calls itself "The Holy Orthodox Catholic and Apostolic Church," and includes three distinct branches—the church in the Ottoman empire, subject directly to the Patriarch of Constantinople; the church in the kingdom of Greece; the Russo-Greek Church in the dominions of the czar.

The proper history of the Greek Church, as a separate body, dates from the commencement of the Greek schism, or, rather, from the commencement of the efforts on the part of the Church of Constantinople to establish for itself a distinct jurisdiction and an independent headship in the eastern division of the empire. The ecclesiastical preëminence of Constantinople followed upon the political distinction to which it rose as the seat of the imperial residence and the center of the imperial government. Originally Byzantium (called Constantinople after 330 A. D.) was but a simple episcopal see, but the rank rose with the fortunes of the city; and before the close of the

fourth century a canon of the first council of Constantinople, held in 381, assures to it, on the ground that Constantinople is the "new Rome," the precedence of honor next after the ancient Rome. The present total number of adherents of the Greek Church is about 90,000,000.

College de France, founded by Francis I., 1530, is now a very important educational institution, giving instruction over a very wide field of literature, history, and science. It is independent of the University of France, directly under the Minister of Public Instruction, and is supported by the government. As in the Sorbonne, the lectures are gratuitous, and for the most part are designed to attract auditors older than ordinary university students. The College comprises two faculties, one literary, one scientific; each has about twenty professors. Among the professors are some of the most distinguished scholars and scientists in France. The subjects mainly covered are political economy, Assyrian and Egyptian archaeology, Arabic, Slavonic literature, French literature, physiology, anatomy, and embryology.

Escorial, The, is a famous monastery of New Castile, Spain, in the province of Madrid. This solitary pile of granite has been called the eighth wonder of the world, and at the time of its erection surpassed every building of the kind in size and magnificence. It owes its origin, it is said, to an inspired vow made by Philip II. during the battle of St. Quentin. On that occasion he implored the aid of St. Lorenzo, on whose day the battle was fought; and vowed that should victory be granted to him he would dedicate a monastery to the saint. The Escorial was begun in 1563 and finished in 1584, and was intended to serve as a palace, mausoleum, and monastery. It has a splendid chapel, with three naves. The Pantheon, or royal tomb, is a magnificently decorated octagonal chamber, in the eight sides of which are numerous black marble sarcophagi. Something of the immensity of the Escorial may be conceived when it is stated that it has 14,000 doors, and 11,000 windows, and its cost was 6,000,000 ducats, or nearly \$14,000,000. Its library, previous to the sack of the Escorial by the French in 1808, contained 30,000 printed and 4,300 manuscript volumes, mainly treasures of Arabic literature. In 1872 the Escorial was struck by lightning and partially destroyed.

Jewish Temple, The, at Jerusalem, was erected by Solomon, and, from the descriptions which have come down to us, probably equaled in magnificence and dimensions any similar building in the ancient world. The

influence of the Assyrian and Egyptian styles of architecture was probably exhibited in its construction, and at no time did the Jews possess a style which might be called their own. It was consecrated 1004 B. C.; pillaged by Shishak, 971; restored by Joash, 856; polluted by Ahaz, 740; again restored by Hezekiah, 726; pillaged and burned by Nebuchednezzar, 588-587; rebuilt, 536, at the period of the return from captivity; pillaged by Antiochus, 168; rebuilt by Herod, 18; and finally destroyed by Titus, A. D. 70. Its supposed site is now covered by the Mosque of Omar.

GLOSSARY OF ART AND MUSICAL TERMS.

Accompaniment. A secondary part added to the principal for the improvement of the general effect.

Acanthus. A plant, the ornamental foliage of which is largely employed for architectural decoration, especially on the Corinthian capital. There are two principal species, *acanthus mollis* and *acanthus spinosa*, the latter somewhat resembling a thistle.

Acropolis. A fortified city, or the fortified part of a city, on the summit of a hill.

Adagio. A slow movement.

Ad Libitum. Implies that the time of the movement is left to the discretion of the performer.

Allegretto. With cheerful quickness.

Amphiprostyle. A Greek temple, having two open porticos in front and rear projecting beyond the side walls.

Amphitheater. A building for gladiatorial and other shows, generally elliptical in form.

Amphora. A wide earthenware jar with two handles.

Andante. Somewhat sedate; slowly.

Animato, Animato, or Con Animato. Animated; with spirit.

Angels. In mediæval art divided into nine degrees: Seraphim, Domination, Princedom, Cherubim, Virtues, Archangels, Thrones, Powers, Angels. The 'Cupid-like angels were only introduced in the time of the Renaissance.

Antææ. Rectangular pilasters forming the ends of the walls of the cells of a Greek temple, and supporting the extremities of the architrave. A temple of this form was called a temple "in antis."

Annulus, } Rings of moldings above the lower part
Annulet, } of the echinus of Doric capitals.

Antefixa. Terra cotta ornaments placed above the cornice and on the ridge of the roof of Greek temples.

Apse. The extremity of a church, generally semicircular in form and surmounted by a semi-dome.

Aquatint. A process of engraving by acid laid on in even washes with a brush, upon a broken surface formed by a cracked film of resin on the copper.

Arabesque. An ornament composed of stems, foliage, leafage of plants, scrolls, and fantastic animals. Not, as its name implies, an Arab invention but found in Greek and Roman architecture.

Arcade. A series of arches.

Arch. A curved structure, generally a segment or segments of the circle. Semicircular arches were used by the Romans; horseshoe arches by the Byzantines and Moors; pointed arches formed of two intersecting segments of circles by the Gothic builders.

Archæic. The early period of art when forms were stiff, conventional, and symbolic.

Architrave. The horizontal part of a structure resting immediately on the capital of column or pilaster.

Assai. Very; used as an adverb with another word.

Astragal. A small semicircular molding at the top of a column beneath the capital, also used to divide the architrave horizontally into parts. Named from its supposed resemblance to a row of knucklebones.

Atemp. In regular time.

Atlantes. Human male figures, employed instead of columns to support the architrave.

Atrium. A covered court in a Roman house, with an opening in the center (compluvium) and roof sloping inwards.

Baldachino. A canopy over seats and other places of honor.

Barrel Vault. A vault of cylindrical form.

Baroque. Rococo.

Base. The lower division of a column on which the shaft is placed; absent in the Doric order.

Basilica. A rectangular hall divided by rows of columns into three naves, and used by the Romans as a court of justice. Adopted as the typical form of early Christian churches.

Bas Relief. (Basso rilievo.) Figures sculptured on panel projecting less than half their proportions from the surface.

Bastion. A projecting polygonal buttress on a fortification.

Battlement. A parapet of a fortification, consisting of alternate raised portions and spaces, the latter called crenels or embrasures.

Bay. A portion of a structure marked off by the division of the vaulting, the arches, or the buttresses.

Beat. An indication of a certain duration of time.

Ben. Implying well, as *ben marcato*.

Body Color. In water-color painting, color made opaque by intermixture with white.

Boss. An architectural ornament of ceilings, placed generally where the ribs of the vault meet.

Buttress. A piece of wall built at right angles to the wall of a building to strengthen the structure, either immediately against the wall or connected by an arch called a flying buttress.

Byzantine. The style of architecture and painting in use at Constantinople from the sixth to the twelfth century.

Calando. A gradual diminution in speed and tone.

Caduceus. A wand of laurel or olive on which two snakes are intertwined; the emblem of Hermes.

Capital. The; usually ornamented, member which crowns the top of a column or pillar, and by the form of which the different orders are characterized.

Caryatides. Female figure, employed instead of columns to support the architrave.

Cella. The internal part inclosed by the walls of a Greek temple.

Chromatic. Proceeding or formed by semi-tones.

Chevron. A zigzag molding used in Romanesque architecture.

Chevet. A form of apse inclosed by an arcade with a series of chapels round it, common in Romanesque and Gothic churches in France.

Chiaro-oscuro. The distribution of light and shade.

Cinquefoill. An ornamental foliation, consisting of five projecting cusps.

Clerestory. The row of windows forming the third or upper division of the nave wall of a church, rising above the roof of the outer portion of the structure.

Cloister. A quadrangular covered walk, forming a portion of a monastic building.

Clustered Column. A pier formed by a number of shafts clustered together, either united, or separate.

Con. With; as *Con espressione*.

Column. A column consists of three principal parts: base, shaft, and capital.

Composite. The last of the five Roman architectural orders, formed by the combination of the Ionic volute with the foliage capital of the Corinthian.

Corinthian. The third order in the Roman classification, of Greek origin. Shaft slender and smooth; capital richly decorated with acanthus leaf ornaments.

Cornice. The horizontal molded projection terminating a building.

Corona. A molding forming part of a conical, with lower part grooved to form a dripstone.

Crescendo. A gradual increase in tone.

Crypt. A subterranean chapel beneath a church.

Cupola. A concave roof.

Cusp. Pointed foliations in architectural tracery.

Cyma. An undulated molding, formed of a concave and convex arc. When the upper arc is convex it is called *cyma reversa*; when the upper is hollow, it is called *cyma recta*.

Da. By.

Dales, or Dal. In a soft, quiet manner.

Damascened. Metal ornamented by inlaying another metal.

Delicato. With delicacy.

Decorated. The second of the pointed or Gothic styles of architecture in England.

Dentils. Ornaments in the form of small cubes or teeth.

Diaper. A mode of decoration by a repeated pattern.

Doloroso. In a melancholy, sad style.

Doric. The oldest and simplest of the Greek orders of architecture.

Dormer. A gable window in the sloping side of a roof.

Dry-Point. Direct engraving upon copper with the scratching needle.

Echinus. The ovolo molding of a capital.

Elevation. The vertical plan of a building.

Entablature. The horizontal superstructure which lies upon the columns in classic architecture.

Entasis. The swelling of the shaft of a column.

Epinaos. The portico situated at the back of a temple.

Espressivo, or Con Espressione. With expression.

Etching. Engraving by the action of acid on a copperplate covered with a wax ground on which lines have been scratched by the etching needle.

Facade. The face or front of a building.

Fan Tracery. Elaborate carved work spread over an arched surface.

Fine. The end.

Fillet. A plain band used in architecture to separate ornaments and moldings.

Finial. An ornament of carved work representing foliage on a pinnacle or spire.

Flamboyant. The style of French architecture peculiar to the fifteenth century, contemporary with perpendicular in England.

Flutes. Small semicircular grooves or channels cut in the shafts of columns or pilasters.

Forte, or For. Strong, loud.

Fresco. Painting executed on a freshly laid ground of stucco.

Fret. An angular, interlaced architectural ornament.

Frieze. (1) The middle division of an entablature which lies between the architrave and cornice. (2) Any horizontal sculptured band.

Furioso. With great animation.

Gable. The triangular end of a house from the eaves to the top.

Genre. Scenes from domestic life.

Giusto. In perfect time.

Grave. The slowest time or movement.

Griseaille. A style of painting in gray by which solid bodies are represented as if in relief.

Groin. The angular curve formed at the intersections of a vaulted roof.

Gusto, Con Gusto. With style; taste.

Gymnasium. A large building used by the Greeks in which gymnastics were taught and practiced.

Hella. A small volute like the tendril of a vine placed under the Corinthian abacus.

Hypostyle. A roof supported by columns.

Il. The.

Impetuoso. Impetuously.

Impasto. The thickness of the body of pigment laid on to a painting.

In. In; as in tempo.

Intrado, or Introduzione. An introduction to a piece of music.

Intaglio. A stone in which the design is sunk beneath the surface, and gives impression of a bas relief.

Ionic. The second order in Greek architecture. Distinguished by the voluted ornaments of its capital.

Jamb. The side of any opening in a wall.

Keystone. The top stone of an arch.

Kiaft. A royal Egyptian headdress forming a kind of hood and terminating in two flaps, which form over the breast.

Largo. A slow and solemn degree of time.

Lancet. A pointed arch, obtuse at the point, resembling a surgeon's lancet.

Lantern. A small turret above the roof of a building having windows all round it.

Legato. In a smooth, even manner.

Leggiando. Lightly.

Lintel. The stone or beam placed across the top of a door or window.

Loggia. The gallery or corridor of a palace.

Lotus. A water lily. In Egypt and India held sacred.

Marcato. In a marked manner.

Mansard. A roof with two sets of rafters of which the upper part is less steep than the lower. Named after a French architect.

Marquetry. Inlaid work of ornamental woods and stones of various colors.

Mausoleum. (1) The tomb of Mausolus, king of Caria. (2) Any tomb of imposing size and magnificence.

Memo. The same.

Mezzo. In a medium degree; as *mezzo forte*.

Medallion. A circular or oval tablet on the face of a building.

Metope. A kind of panel between the triglyphs in the Doric frieze.

Mezzo Relievo. Sculpture in relief in which half of the figure projects.

Mezzo Tinto. A method of engraving by smoothing away the lights from a ground mechanically roughened.

Moderato. Moderately.

Molto. Very; as *molto forte*.

Movimento. Movement; time.

Monolith. An object formed of a single block of stone.

Mosaic. An imitation of painting by joining together minute pieces of hard substances of different colors.

Mullion. The slender pieces which separate a window into compartments.

Mutule. An architectural ornament of the Doric order, consisting of a square block placed at equal intervals in a Doric cornice.

Naos. The interior apartment of a Greek temple.

Nave. The middle part or body of a church from the choir to principal entrance between the aisles.

Nimbus. A halo or circular disk around the head of sacred personages. After the eighth century, living persons were in Italy distinguished by a square nimbus, which sometimes assumes the form of a scroll partly unrolled.

The heads of statues of gods and of Roman emperors were decorated with a crown of rays. The same is found in the Oriental representation of Buddha.

Obbligato. An essential portion of a composition.

Ogee. An arch described with four centers so as to be concave in lower and convex in upper part.

Ogive. A pointed arch.

Order. An, in architecture consists of two parts: the one, vertical, consisting of a column and its base and capital; the other, a horizontal entablature, consisting of architrave, frieze, and cornice. The word is only used when the order is one of the five whose dimensions and details were fixed and defined by Palladio and other architects of the sixteenth century; these are the Doric, Ionic, Corinthian, Tuscan (supposed to be a simpler form of Doric), and Composite (a Roman modification of Corinthian).

Oriel. A projecting angular window, generally triangular or pentagonal in shape.

Ottava, or Sva. An octave.

Ovolo. A convex molding much used in classical architecture.

Pagoda. A religious building of the Hindoos.

Palæstra. A place for wrestling, formerly part of the gymnasium.

Pedale, or Ped. Signifies that performer must press down pedal.

Pen. A little.

Pediment. A triangular crowning of a portico usually supported by a row of columns.

Pendentive. The part of a vault between two arches supporting a dome.

Peripteral. A name given to a temple which had a portico of six columns on each front and a detached colonnade of 11 on each side of the cella.

Peristyle. A building, the interior of which is surrounded with columns.

Perspective. The art of representing on a flat surface the appearance of objects from one given point of view.

Piano, or P. Soft.

Pianissimo, or PP. Very soft.

Pier. Perpendicular supports from which arches spring.

Pilaster. Square pillar on a wall partly imbedded in it, less than one fourth of its thickness projecting.

Pinnacle. A small spire.
Piscina. A stone basin usually placed in a niche in the wall of the chancel at which the priest might wash his hands.
Pius. More.
Plinth. The lower projecting base of a column.
Poco a Poco. Gradually; by a regular gradation.
Pomposo. Pompously.
Precipitato. Very quickly; hurriedly.
Premiere. First; as *première fois*; first time.
Presto. Very quick.
Primo. First, as *violino primo*, first violin.
Pronaos. The portico situated in front of a temple.
Propylaea. Gateway or entrance to an Egyptian temple.

Quasi. In the manner of; like.
Quieto. With repose, quietly.
Quatrefoil. An ornament in pointed architecture, consisting of four foils.

Rapido. Rapidly.
Rinforzando. *Rinf.* or *Rf.*, with increase.
Riteneute, Ritenuto. Decreasing in speed.
Rococo. A style of decoration distinguished by a superfluity of confused and discordant detail.
Romanesque. The debased style of architecture and ornament adopted in the later Roman empire, and the styles founded upon it.

Rose Window. A large, circular window divided into compartments by curved mullions.
Rubble. Rough stones and broken bricks, used to fill up between walls.

Rustication. Hewn stone masonry, the joints of which are rendered conspicuous by grooves or channels.

Sarcophagus. A stone coffin.
Scumbling. The process of going over a painting with a brush, nearly dry, to soften and blend the tints.
Segno. Sign, as *al segno*, go back to sign.
Sempre. Always, as *sempre piano*.
Serioso. Seriously.
Shaft. The body of a column.
Solo, Sola. Alone. A composition rendered by one person.

Sostenuto or Sost. Prolonged, sustained.
Spirito. With spirit.
Sphinx. A human head on a lion's body, typifying the union of intellectual and physical power. An Egyptian emblem, signifying the religious mystery.
Staccato. Each note to be distinctly marked.
Stesso. The same.
Stylobate. The common base of a row of columns.
Syncope. Connecting the last note of a bar with

the first note of the following, thus forming one prolonged note with a duration equal to the two.
Syncope. In a syncope style.

Tanto or Ten. Not so much.
Tardo. Slowly.
Taenia. A band which separates the Doric frieze from the architrave.
Tempo Comodo. Conveniently.
Tempera. Painting with pigments mixed with chalk or clay, and diluted with size.
Theme. A subject.
Thalamus. The nuptial chamber in a Rome house.
Torso. The trunk of the statue of a human figure.
Tranquillo. Tranquilly.
Tremendi. With terrific expression.
Tremando, Tremolo. The rapid striking of a note so as to produce a tremulous effect.
Trille, or Trillo. A trill or shake.
Trio. A composition for three performers.
Triplet. A group of three notes equal in duration of time to two notes of the same value.
Tracery. Geometrical ornament.
Transsept. A transverse nave, passing in front of the choir, and crossing the longitudinal nave of a church.
Transom. The horizontal cross bar in a window.
Trefoil. An ornament of three foils.
Triforium. The second or middle story of the nave wall of a Gothic church, consisting of a gallery over the ceiling of the side aisle and below its roof.
Triglyph. An ornament, consisting of three flutings or upright groupings, separating the metopes in a Doric frieze.
Triptych. A form of pictures in three panels.
Tympanum. The triangular space between the horizontal and sloping cornices. The name is also given to the space included between the lintel of a door and the arch over it.

Un. A, as *un poco*, a little.

Vault. An arched ceiling or roof of stone.
Veloce. Rapidly.
Velocissimo. With great rapidity.
Vigoroso. With vigor.
Vivace. Vivamented; briskly.
Volti Subito. Turn over quickly.
Volute. A spiral scroll.
Voussairs. The wedge-shaped stones used in constructing an arch.

Zoophorus, } (Lit. bearing animals.) A continuous
Zophorus. } frieze, decorated with figures of animals, conventional and real.

University of Michigan.—This university was established by a legislative act of 1821, repealing a previous act of 1817, by which a "university or catholepistemiad" had been created by the *ipse dixit* of Judge C. B. Woodward. The university was not organized until March of 1837, when the regents obtained a loan of \$100,000 from the state, and erected five buildings at Ann Arbor. In the fall of the same year instruction was begun with a faculty of two, and an entering class of six. Until 1853 the school remained in a state of partial development, owing to incessant interference from the legislature and internal dissensions among the faculty. In 1852 a new board of regents was constituted, with a president to whom independence of action was guaranteed. Dr. Henry P. Tappan was elected and continued in office until 1863, when he was summarily removed. This action was protested against by the faculty as well as by the students and alumni, and was twice made a subject of censure by subsequent boards of

regents. During Dr. Tappan's presidency the university more than quadrupled in numbers, and made itself recognized as a school of liberal learning on both sides of the Atlantic. Since that time the presidents have been: E. O. Haven, 1863-1869; Henry S. Frieze, 1869-1871; and James B. Angell, from 1871 until the present time.

The university is a part of the public educational system of the state. The governing body is a board of eight regents, elected by popular vote for eight years. The university comprises the department of literature, science, and arts, including the graduate and summer school, the department of engineering, of medicine and surgery, of law, the school of pharmacy, the homeopathic medical college, and that of dental surgery.

The various courses lead respectively to the degrees, B.A., B.Sc., Ph.B., Litt.B., the corresponding Master's degrees and doctorates, as well as the usual professional degrees.

| January 1, 1865..... | 620,924 | 338,636 | 959,460 |
| May 1, 1865..... | 797,807 | 202,709 | 1,000,516 |

The Union losses at Bull Run (first Manassas), July 21, 1861, were: Killed, 470; wounded, 1,071; captured and missing, 1,793; aggregate, 3,334.

The Confederate losses in particular engagements were as follows: Bull Run (first Manassas), July 21, 1861, killed, 387; wounded, 1,582; captured and missing, 13; aggregate, 1,982. Fort Donelson, Tenn., February 14-16, 1862, killed, 406; wounded, 1,534; captured and missing, 13,829; aggregate, 15,829. Shiloh, Tenn., April 6-7, 1862, killed, 1,723; wounded, 8,012; captured and missing, 959; aggregate, 10,694. Seven Days' Battle, Virginia, June 25-July 1, 1862, killed, 3,478; wounded, 16,261; captured and missing, 875; aggregate, 20,614. Second Manassas, August 21-September 2, 1862, killed, 1,481; wounded and missing, 7,627; captured and missing, 89; aggregate, 9,197. Antietam campaign, September 12-20, 1862, killed, 1,886; wounded, 9,348; captured and missing, 1,367; aggregate, 12,601. Fredericksburg, December 13, 1862, killed, 596; wounded, 4,068; captured and missing, 651; aggregate, 5,315. Stone River, Tenn., December 31, 1862, killed, 1,294; wounded, 7,945; captured and missing, 1,027; aggregate,

gate, 10,266. Chancellorsville, May 1-4, 1863, killed, 1,665; wounded, 9,081; captured and missing, 2,018; aggregate, 12,764. Gettysburg, July 1-3, 1863, killed, 2,592; wounded, 12,706; captured and missing, 5,150; aggregate, 20,448. Chickamauga, September 19-20, 1863; killed, 2,268; wounded,

13,613; captured and missing, 1,090; aggregate, 16,971.

"Gettysburg was the greatest battle of the war; Antietam the bloodiest. The largest army was assembled by the Confederates at the seven days' fight; by the Unionists at the Wilderness."

THE GREAT BATTLES OF THE CIVIL WAR.

As to the loss in the Union armies, the greatest battles in the war were:—

| DATE. | BATTLE. | Killed. | Wounded.* | Missing. | Aggregate. |
|-----------------------------|---------------------------|---------|-----------|----------|------------|
| July 1-3, 1863..... | Gettysburg..... | 3,070 | 14,497 | 5,434 | 23,001 |
| May 8-18, 1864..... | Spottsylvania..... | 2,725 | 13,413 | 2,258 | 18,396 |
| May 5-7, 1864..... | Wilderness..... | 2,246 | 12,037 | 3,383 | 17,666 |
| September 17, 1862..... | Antietam†..... | 2,108 | 9,649 | 753 | 12,410 |
| May 1-3, 1863..... | Chancellorsville..... | 1,606 | 9,762 | 5,919 | 17,287 |
| September 19, 20, 1863..... | Chickamauga..... | 1,656 | 9,749 | 4,774 | 16,179 |
| June 1-4, 1864..... | Cold Harbor..... | 1,844 | 9,077 | 1,816 | 12,737 |
| December 11-14, 1862..... | Fredericksburg..... | 1,284 | 9,600 | 1,769 | 12,653 |
| August 28-30, 1862..... | Manassas..... | 1,747 | 8,452 | 4,263 | 14,462 |
| April 6-7, 1862..... | Shiloh..... | 1,754 | 8,408 | 2,885 | 13,047 |
| December 31, 1862..... | Stone River‡..... | 1,730 | 7,802 | 3,717 | 13,249 |
| June 15-19, 1864..... | Petersburg (assault)..... | 1,688 | 8,513 | 1,185 | 11,386 |

* Wounded in these and the following returns includes mortally wounded.

† Not including South Mountain or Crampton's Gap.

‡ Including Chantilly, Rappahannock, Bristol Station, and Bull Run Bridge.

§ Including Knob Gap and losses on January 1 and 2, 1863.

Secession and Readmission of Confederate States.

| | Seceded. | Readmitted. |
|---------------------|---------------------|----------------|
| South Carolina..... | Dec. 20, 1860..... | June 11, 1868 |
| Mississippi..... | Jan. 9, 1861..... | Feb. 3, 1870 |
| Alabama..... | Jan. 11, 1861..... | June 11, 1868 |
| Florida..... | Jan. 11, 1861..... | June 11, 1868 |
| Georgia..... | Jan. 19, 1861..... | April 20, 1870 |

| North Carolina..... | May 21, 1861..... | June 11, 1868 |
| Tennessee..... | June 24, 1861..... | July, 1868 |

The whole number of men obtained by draft was 168,649. The whole number of colored troops obtained was 186,097. The greatest number in active service in the army at any one time was 797,807.

The Diplomatic Service.—The diplomatic service of the United States, all of which is in charge of the Secretary of State, consists of Envoys Extraordinary and Ministers Plenipotentiary, Ministers Resident, Charges d'Affaires, Consuls-General, Consuls and Commercial Agents.

The highest class of ministers are those sent to France, Germany, Great Britain, and Russia; they are paid \$17,500 per year. The second class (\$12,000 a year) are sent to Austria, Hungary, Brazil, China, Italy, Japan, Mexico, and Spain. The third class (\$10,000 a year) go to Chile, Peru, and the Central American States. Ministers Resident receive

\$7,500 (with the exception of the one in Bolivia, \$5,000, and the one in Liberia, \$4,000), and are in the Argentine Republic, Belgium, Colombia, Hawaiian Islands, Hayti, the Netherlands, Sweden and Norway, Turkey and Venezuela. Charges d'Affaires have \$5,000 a year, and are in Denmark, Portugal, Switzerland, Uruguay, and Paraguay. There are five Consuls-General in British dominions, at Calcutta, Melbourne, London, Halifax, and Montreal; two in Germany, at Berlin and Frankfurt; two in Turkey, at Cairo and Constantinople; and one each in Paris, Vienna, Rome, St. Petersburg, Bucharest, Bangkok, Shanghai, Kanagawa, and Mexico. Their salaries range from \$2,000 to \$6,000. There are the following ranks of consulates: Five at \$6,000 a year; two at \$5,000; one at \$4,500; six at \$4,000; eight at \$3,500; twenty-one at \$3,000; sixteen at \$2,500; thirty-seven at \$2,000; forty-seven at \$1,500; and twenty at \$1,000. All consuls receiving a fixed salary pay into the treasury all fees received by virtue of their office. But there are many consuls and agents whose only compensation comes from fees. Such officers are usually allowed to go into business.

Mason and Dixon's Line.—A name given to the southern boundary line of the free state of Pennsylvania which formerly

separated it from the slave states of Maryland and Virginia. It was run—with the exception of about twenty-two miles,—by Charles Mason and Jeremiah Dixon, two English mathematicians and surveyors, between Nov. 15, 1783, and Dec. 26, 1787. During the excited debate in Congress, in 1820, on the question of excluding slavery from Missouri, the eccentric John Randolph of Roanoke made great use of this phrase, which was caught up and re-echoed by every newspaper in the land, and thus gained a celebrity which it still retains.

Famous Giants and Dwarfs.—The most noted giants of ancient and modern times are as follows:—

| Name. | Place. | Height. Feet. | Period. |
|------------------------|-------------|------------------|-----------------|
| Goliath..... | Palestine.. | 11.0 | B. C. 1063. |
| Galbala..... | Rome..... | 9.9 | Claudius Cæsar. |
| John Middleton..... | England.... | 9.3 | A. D. 1578. |
| Frederick's Swede..... | Sweden.... | 8.4 | |
| Culjanus..... | Finland.... | 7.9 | |
| Gilly..... | Tyrol..... | 8.1 | |
| Patrick Cotter..... | Cork..... | 8.7 | 1806. |
| Chang Gow..... | Pekin..... | 7.8 | 1880. |

Many of the great men of history have been rather small in stature. Napoleon was only about 5 ft. 4 in., while Grant was 5 ft. 7 in. One of the greatest of American statesmen, Alexander H. Stephens, never excelled 115 pounds in weight, and in his old age his weight was less than 100 pounds.

The more notable human mites are named below:—

| Name | Height. Inches. | Date of Birth. | Place of Birth. |
|------------------------------------|--------------------|-------------------|--------------------|
| Count Borowlaski..... | 39 | 1739 | Warsaw. |
| Tom Thumb (Chas. S. Stratton)..... | 31 | 1837 | New York. |
| Mrs. Tom Thumb..... | 32 | 1842 | New York. |
| Che-Mah..... | 25 | 1838 | China. |
| Lucia Zarate..... | 20 | 1863 | Mexico. |
| General Mite..... | 21 | 1864 | New York. |

Summer Heat in Various Countries.

The following figures show the extreme summer heat in the various countries of the world: Bengal and the African desert, 150° Fahrenheit; Senegal and Guadaloupe, 130°; Persia, 125°; Calcutta and Central America, 120°; Afghanistan and the Arabian desert, 110°; Cape of Good Hope and Utah, 105°; Greece, 104°; Arabia, 103°; Montreal, 103°; New York, 102°; Spain, India, China, Jamaica, 100°; Sierra Leone, 94°; France, Denmark, St. Petersburg, Shanghai, the Burman Empire, Buenos Ayres, and the Sandwich Islands, 90°; Great Britain, Siam, and Peru, 85°; Portugal, Pekin, and Natal, 80°; Siberia, 77°; Australia and Scotland, 75°; Italy, Venezuela, and Madeira, 73°; Prussia and New Zealand, 70°; Switzerland and Hungary, 66°; Bavaria, Sweden, Tasmania, and Moscow, 65°; Patagonia and the Falkland Isles, 55°; Iceland, 45°; Nova Zembla, 34°.

Curious Misnomers.—Arabic figures were not invented by the Arabs, but the early scholars of India.

Cleopatra's needles were not erected by that queen, neither do they commemorate any event in her history. They were set up by Rameses the Great.

The Jerusalem artichoke has no connection whatever with the holy city of the Jews. It is a species of sunflower, and gets its name from girasole, one of the scientific names of that genus of plants.

The word "pen" means a feather, and is from the Latin penna, a wing. Surely the expression "a steel pen" could be improved upon.

Galvanized iron is not galvanized at all, but is coated with zinc by being plunged into a bath of that metal and muriatic acid.

Pompey's pillar at Alexandria was neither erected by Pompey nor to his memory.

Common salt is not a salt and has long since been excluded from the class of bodies denominated "salts."

Rice paper is not made from either rice or straw, but from a pithy plant called tungtsua, found in China, Corea, and Japan.

Brazil grass neither comes from nor grows in Brazil. It is strips from a species of Cuban palm.

Rare United States Coins and their Value.—The rarest of the Half-cents are as follows: 1793 valued at \$1; 1796 valued at \$10; 1831, 1836, 1840 to 1849, and 1852, valued at \$4.

The rarest of the Cents are as follows: 1793 with wreath is valued at \$2.50; 1793 with chain valued at \$3.50; 1793 with liberty cap, valued at \$4; 1799 valued at \$25; 1804 valued at \$200; 1809 valued at \$1.

The rarest of the Silver Dollars are as follows: 1794 valued at \$35; 1798, with small eagle, valued at \$2; 1799 with five stars facing, valued at \$2; 1804 valued at \$800; 1836 valued at \$5; 1838 valued at \$25; 1839 valued at \$15; 1851 valued at \$20; 1852 valued at \$25; 1854 valued at \$6; 1855 valued at \$5; 1856 valued at \$2; 1858 valued at \$20.

The rarest of the Silver Half Dollars are as follows: 1794 valued at \$5; 1796 valued at \$40; 1797 valued at \$30; 1801 valued at \$2; 1802 valued at \$2; 1815 valued at \$4; 1836 reeded, valued at \$3; 1838 Orleans, valued at \$5; 1852 valued at \$3; 1853, no arrows, valued at \$15.

The rarest of the Silver Quarter Dollars are as follows: 1796 valued at \$3; 1804 valued at \$3; 1823 valued at \$50; 1853, no arrows, valued at \$4.

The rarest of the Silver Twenty-cent pieces

are as follows: 1874 proof, valued at \$10; 1877 proof, valued at \$2; 1878 proof, valued at \$2.

The rarest of the Silver Dimes, or Ten-cent pieces, are as follows: 1796 valued at \$3; 1797, 16 stars, valued at \$4; 1797, 13 stars, valued at \$1.50; 1798 valued at \$2; 1800 valued at \$4; 1801 to 1804, each valued at \$3; 1804 valued at \$5; 1805 to 1811, each valued at 50 cents; 1811 valued at 75 cents; 1822 valued at \$3; 1846 valued at \$1.

The rarest of the Silver Half-Dimes, or Five-cent pieces, are as follows: 1794 valued at \$3; 1795 valued at 75 cents; 1796 and 1797 valued at \$2 each; 1800 valued at 75 cents; 1801 valued at \$1.50; 1802 valued at \$50; 1803 valued at \$1.50; 1805 valued at \$3; 1846 valued at \$1.

The rarest of the Silver Three-cent pieces are as follows: 1851 to 1855 valued at 15 cents each; 1855 valued at 25 cents; 1856 to 1862 valued at 15 cents each; 1863 to 1873 valued at 50 cents each.

Feminine Height and Weight.—It is often asked how heavy a woman ought to be in proportion to her height. A very young girl may becomingly be thinner than a matron, but the following table gives a fair indication of proper proportions:—

| Pounds. | Pounds. |
|-------------------------------|-------------------------------|
| Five ft. in height, about 100 | Five ft. seven in., about 150 |
| Five ft. one inch " 100 | Five ft. eight in. " 155 |
| Five ft. two inches " 113 | Five ft. nine in. " 163 |
| Five ft. three in. " 119 | Five ft. ten in. " 169 |
| Five ft. four in. " 130 | Five ft. eleven in. " 176 |
| Five ft. five inches " 138 | Six feet " 180 |
| Five ft. six inches " 144 | Six feet one inch " 186 |

Great Financial Panics.—The most remarkable crises since the beginning of the present century have been as follows: 1814, England, two hundred and forty banks suspended; 1825, Manchester, failures two millions; 1831, Calcutta, failures fifteen millions; 1837, United States, "Wild-cat" crisis, all banks closed; 1839, Bank of England saved by Bank of France; severe also in France, where ninety-three companies failed for six millions; 1844, England, state loans to merchants, Bank of England reformed; 1847, England, failures twenty millions, discount thirteen per cent.; 1857, United States, 7,200 houses failed for one hundred and eleven millions, 1866, London, Overend-Gurney crisis, failures exceeded one hundred millions; 1869, Black Friday in New York (Wall street), September 24; 1873-'76, the bank clearings in New York city fell off from thirty-five billions in 1873 to twenty-three billions in 1874, and reached their lowest point since 1863 at twenty-two billions in 1876. In foreign trade, the excess of imports disappeared in 1874. The panic of 1893 was felt severely for several years. In 1893 the bank failures in the United States were as follows: 158 national banks, 177 private banks, 47 savings banks, 13 loan and trust companies, and 16 mortgage companies.

Yankee-Doodle.—The air known as "Yankee-Doodle" was originally "Nankee-Doodle," and is as old as the time of Cromwell. It was known in New England before the Revolution, and is said to have been played by the English troops in derisive allusion to the then popular nickname of the New

Englanders; and afterwards the New Englanders, saying that the British troops had been made to dance to "Yankee-Doodle," adopted the air.

Yankee, Origin of the Name.—The theories which have been advanced as to the origin of this name are numerous. According to Thierny it was a corruption of Jankin, a diminutive of John, which was a nickname given by the Dutch colonists of New York to their neighbors in the Connecticut settlements. In a history of the American war, written by Dr. William Gordon, and published in 1789, was another theory. Dr. Gordon said that it was a cant word in Cambridge, Mass., as early as 1713, used to denote especial excellence—as a Yankee good horse, Yankee good cider, etc. He supposed that it was originally a byword in the college, and, being taken by the students into parts of the country, gradually obtained general currency in New England, and at length came to be taken up in other parts of the country, and applied to New Englanders as a term of slight reproach. Aubury, an English writer, says that it is derived from a Cherokee word—*eankke*—which signifies coward and slave. This epithet was bestowed on the inhabitants of New England by the Virginians for not assisting them in a war with the Cherokees. The most probable theory, however, is that advanced by Mr. Heckewelder, that the Indians, in endeavoring to pronounce the word English, or Anglais, made it Yengees, or Yangees, and this originated the term.

The World's Fairs.

Notable on account of its display of electrical power and contrivances. The largest in extent of exhibits, buildings, and general equipment in history.

The Average Velocities of Various Bodies.—A man walks 3 miles per hour or 4 feet per second. A horse trots 7 miles per hour or 10 feet per second. A horse runs 20 miles per hour or 29 feet per second. Steamboat runs 20 miles per hour or 28 feet per second. Sailing vessel runs 10 miles per hour or 14 feet per second. Rapid rivers flow 3 miles per hour or 4 feet per second. A moderate wind blows 7 miles per hour or 10 feet per second. A storm moves 36 miles per hour or 52 feet per second. A hurricane moves 80 miles per hour or 117 feet per second. A rifle ball moves 1,000 miles per hour or 1,466 feet per second. Sound, 743 miles per hour or 1,142 feet per second. Light, 192,000 miles per second. Electricity, 288,000 miles per second.

Table of the Principal Alloys.—A combination of copper and tin makes bath metal.

A combination of copper and zinc makes bell metal.

A combination of tin and copper makes bronze metal.

A combination of tin, antimony, copper, and bismuth makes britannia metal.

A combination of tin and copper makes cannon metal.

A combination of copper and zinc makes Dutch gold.

A combination of copper, nickel, and zinc, with sometimes a little iron and tin, makes German silver.

A combination of gold and copper makes standard gold.

A combination of gold, copper, and silver makes old standard gold.

A combination of tin and copper makes gun metal.

A combination of copper and zinc makes mosaic gold.

A combination of tin and lead makes pewter.

A combination of lead and a little arsenic makes sheet metal.

A combination of silver and copper makes standard silver.

A combination of tin and lead makes solder.

A combination of lead and antimony makes type metal.

A combination of copper and arsenic makes white copper.

How to Mix Printing Inks and Paints in the Preparation of Tints.

—The first named color always predominates.

Mixing dark green and purple makes bottle green.

Mixing white and medium yellow makes buff tint.

Mixing red, black, and blue makes dark brown.

Mixing bronze, blue, lemon yellow, and black makes dark green.

Mixing, white, medium yellow, and black makes drab tint.

Mixing white, lake, and lemon yellow makes flesh tint.

Mixing lemon yellow and bronze blue makes grass green.

Mixing white and black makes gray tint.

Mixing white and purple makes lavender tint.

Mixing red, black, and medium yellow makes maroon.

Mixing lake and purple makes magenta.

Mixing medium yellow and purple makes olive green.

Mixing medium yellow and red makes orange.

Mixing white, ultramarine blue, and black makes pearl tint.

Mixing white and lake makes pink.

Mixing ultramarine blue and lake makes purple.

Mixing orange, lake, and purple makes russet.

Mixing medium yellow, red, and white makes sienna.

Mixing white and ultramarine blue makes sky blue.

Mixing ultramarine blue, black, and white makes slate.

Mixing vermilion and black makes Turkey red.

Mixing white, yellow, red, and black makes umber.

Durability of Different Woods.—

Experiments have been lately made by driving sticks, made of different woods, each two feet long and one and one half inches square, into the ground, only one half an inch projecting outward. It was found that in five years all those made of oak, elm, ash, fir, soft mahogany, and nearly every variety of pine, were totally rotten. Larch, hard pine, and teak wood were decayed on the outside only, while acacia, with the exception of being also slightly attacked on the exterior, was otherwise sound. Hard mahogany and cedar of Lebanon were in tolerably good condition; but only Virginia cedar was found as good as when put in the ground. This is of some importance to builders, showing what woods should be avoided, and what others used by preference in underground work.

The durability of wood when kept dry is very great, as beams still exist which are known to be nearly 1,100 years old. Piles driven by the Romans prior to the Christian era have been examined of late, and found to be perfectly sound after an immersion of nearly 2,000 years.

The wood of some tools will last longer than the metals, as in spades, hoes, and plows. In other tools the wood is first gone, as in wagons, wheelbarrows, and machines. Such wood should be painted or oiled; the paint not only looks well, but preserves the wood; petroleum oil is as good as any other.

Hard wood stumps decay in five or six years; spruce stumps decay in about the same time; hemlock stumps in eight to nine years; cedar, eight to nine years; pine stumps, never.

Cedar, oak, yellow pine, and chestnut are the most durable woods in dry places.

Timber intended for posts is rendered almost proof against rot by thorough seasoning, charring, and immersion in hot coal tar.

Time in Which Money Doubles.

| Per Cent. | SIMPLE INTEREST. | COMP. INTEREST. | Per Cent. | SIMPLE INTEREST. | COMP. INTEREST. |
|-----------|------------------|-----------------|-----------|------------------|-----------------|

Pecuniary Value of Metals.—Few people have any idea of the value of precious metals other than gold, silver, and copper, which are commonly supposed to be the most precious of all. There are many metals more valuable and infinitely rarer. The following table gives the names and prices of all the known metals of pecuniary worth:—

| Price, Av. Pound | Price, Av. Pound |
|-------------------------|-----------------------|
| Gallium.....\$68,600.00 | Tellurium.....490.00 |
| Vanadium.....10 780.00 | Chromium.....490.00 |
| Rubidium.....9,800.00 | Gold.....300.00 |
| Thorium.....8,330.00 | Molybdenum.....245.00 |
| Glucium.....5,800.00 | Platinum.....141.00 |
| Calcium.....4,900.00 | Thallium.....122.50 |
| Lanthanum.....4,900.00 | Iridium.....112.00 |
| Lithium.....4,900.00 | Tungsten.....36.00 |
| Indium.....4,410.00 | Potassium.....28.00 |
| Tantalum.....4,410.00 | Selenium.....18.80 |
| Yttrium.....4,410.00 | Cobalt.....8.00 |
| Didymium.....4,410.00 | Magnesium.....4.50 |
| Strontium.....4,200.00 | Bismuth.....2.75 |
| Arum.....3,675.00 | Sodium.....2.50 |
| Erbium.....3,675.00 | Cadmium.....1.30 |
| Euthenium.....2,695.00 | Manganese.....1.10 |
| Niobium.....2,40.00 | Arsenic......40 |
| Rhodium.....2,450.00 | Aluminium.....34 |
| Barium.....1,960.00 | Tin.....25 |
| Titanium.....1,102.00 | Copper.....25 |
| Zirconium.....1,040.00 | Antimony.....16 |
| Osmium.....1,040.00 | Zinc.....11 |
| Uranium.....960.00 | Lead......08 |
| Palladium.....500.00 | |

VALUE OF METALS AS CONDUCTORS.

| | Heat. | Electricity. | | Heat. | Electricity. |

* Capital punishment abolished in 1876.

Great Fires and Conflagrations.

London, September 2-6, 1666.—Eighty-nine churches, many public buildings, and 13,200 houses destroyed; 400 streets laid waste, 200,000 persons homeless. The ruins covered 436 acres.

New York, Dec. 16, 1835.—600 buildings; loss, \$20,000,000. Sep. 6, 1839.—\$10,000,000 worth of property.

Pittsburg, April 10, 1845.—1,000 buildings; loss, \$6,000,000.

Philadelphia, July 9, 1850.—350 buildings; loss, \$1,500,000; 25 persons killed; 9 drowned; 120 wounded.

St. Louis, May 4, 1851.—Large portion of the city burned; loss, \$15,000,000.

San Francisco, May 3-5, 1851.—2,500 buildings; loss, \$3,500,000; many lives lost. June 22, 1851.—500 buildings; loss, \$3,000,000.

Santiago (Spain), Dec. 8, 1863.—A fire in the church of the Campana, beginning amid combustible ornaments; 2,000 persons killed, mostly women.

Charleston, S. C., Feb. 17, 1865.—Almost

totally destroyed, with large quantities of naval and military stores.

Richmond, Va., April 2 and 3, 1865.—In great part destroyed by fire at time of Confederate evacuation.

Portland, Me., July 4, 1866.—Almost entirely destroyed; loss, \$15,000,000.

Chicago, Oct. 8 and 9, 1871.—Three and one half square miles laid waste; 17,450 buildings destroyed; 200 persons killed; 98,500 made homeless. July 14, 1874.—Another great fire; loss, \$4,000,000.

Great forest fires in Michigan and Wisconsin, Oct. 8–14, 1871.—2,000 lives lost.

Boston, Nov. 9–11, 1872.—800 buildings; loss, \$73,000,000; 15 killed.

Fall River, Mass., Sept. 19, 1874.—Great factory fires; 60 persons killed.

St. John, N. B., June 20, 1877.—Loss, \$12,500,000.

Brooklyn Theater burned, Dec. 5, 1876.—800 lives lost.

Seattle and Spokane, Wash., 1889.—About \$10,000,000 each.

Jacksonville, Fla., May 3, 1901.—Property loss \$10,000,000.

Iroquois Theater, Chicago, Dec. 30, 1903.—Entailed a loss of 639 lives.

Baltimore, Md., Feb. 7 and 8, 1904.—More than 75 city blocks destroyed, covering 140 acres; financial loss, \$85,000,000.

Rochester, N. Y., Feb. 26, 1904.—Fire in business center; loss, \$2,700,000.

Toronto, Canada, April 19, 1904.—Destruction of business district causes losses of \$12,000,000.

Great Floods and Inundations.—An inundation in Cheshire, England, A. D. 858.—8,000 persons perished.

Glasgow, A. D. 758.—More than 400 families drowned.

Flanders, 1108.—Inundated by the sea, and the town and harbor of Ostend completely submerged.

Dort, April 17, 1421.—72 villages submerged; 100,000 people drowned.

Overflow of the Severn, A. D. 1483, lasting ten days.—Men, women, and children carried away in their beds, and the waters covered the tops of many mountains.

General inundation in Holland, A. D. 1530.—By failure of dikes; 400,000 said to have been drowned.

At Catalonia, A. D. 1617.—50,000 drowned.

Johnstown, Pa., May 31, 1889.—By the

bursting of a huge reservoir on the mountains the town was almost entirely destroyed, and about 6,000 persons perished. The water in its passage to Johnstown descended about 250 feet, with a velocity of nearly fifty miles an hour, and as it swept through the valley it cut trees away as though they were stalks of mullein.

Galveston, Tex., Sept. 8, 1900.—Greatest in the history of the country. Six thousand or more lives lost and \$30,000,000 worth of property destroyed. The strong wind from the sea drove the great waves with such tremendous force that almost everything was swept before it. The effect of this terrific water storm was felt for miles into the interior.

The Great Waterfalls.—According to a recent calculation, the highest waterfalls in the world are the Yosemite Falls, California, 1,500 feet. Krimbs Falls have a total height of 1,148 feet. The three falls next in height are found in Scandinavia—the Verne Foss, in Romsdal, 984 feet; the Vettis Foss, on the Sogne Fiord, 853 feet; the Rjukan Foss, in Thelemarken, 804 feet. With a decrease in height of 213 feet, the three Velino Falls, 591 feet, near Zerni (the birthplace of Tacitus), follow next in order, and they are succeeded by the three Tessa Falls, in the Val Formazza, 541 feet. The Gastein Falls, in the Gastein Valley, 469 feet, rank between the Skjaggedal Foss, in the Hardanger Fiord, 424 feet, and the Boring Foss, in the same fiord. If the width of the falls is taken into consideration, the most imposing are those of the Victoria Falls of the Zambesi, which are 391 feet high, with a width of 3,200 feet. A long way behind these falls come the Niagara Falls, 177 feet high and 1,968 feet wide.

Weight of Eggs.—The following table of the weight of eggs per pound of various breeds of fowls and the number of eggs laid in a year is approximately fair, though it may vary under exceptionally adverse or favorable conditions:—

| Varieties. | Eggs per pound. | No. Eggs per year. |
|---------------------------------|-----------------|--------------------|
| Light Brahmas..... | 7 | 130 |
| Dark Brahmas..... | 8 | 130 |

| Potatoes..... | 10 to 15 " | Tobacco..... | 2 oz. |

Wood for Fuel.—In regard to the relative values of woods as heat producers, different woods vary some by different methods of experimenting. The most accurate would be their value as steam producers. The following test was made from a fire tubular horizontal boiler:—

| | | | |
|------------------------|-----|--------------------|----|
| Shellbark Hickory..... | 100 | Hard Maple..... | 59 |
| Pignut Hickory..... | 95 | White Elm..... | 58 |
| White Oak..... | 84 | Red Cedar..... | 56 |
| White Ash..... | 84 | Wild Cherry..... | 55 |
| Dogwood..... | 77 | Yellow Pine..... | 54 |
| Scrub Oak..... | 73 | Chestnut..... | 52 |
| White Hazel..... | 72 | Yellow Poplar..... | 51 |
| Apple Tree..... | 70 | Butternut..... | 43 |
| Red Oak..... | 67 | White Birch..... | 43 |
| White Beech..... | 65 | White Pine..... | 80 |
| Yellow Oak..... | 60 | | |

These figures are from air-dried wood. No accurate result could be obtained from green wood, as it is not in a proper condition, and would vary considerably from any figures that might be made.

Common Sizes of Flat Papers.

| NAME. | SIZE. | NAME. | SIZE. |

The Language of Flowers.

SINGLE FLOWERS.

Arbor Vitæ—Unchanging friendship.
 Camellia, White—Loveliness.
 Candytuft—Indifference.
 Carnation, White—Disdain.
 China Aster—Variety.
 Clover, Four-Leaf—Be mine.
 Clover, White—Think of me.
 Clover, Red—Industry.
 Columbine—Folly.
 Daisy—Innocence.
 Daisy, Colored—Beauty.
 Dead Leaves—Sadness.
 Deadly Nightshade—Falsehood.
 Fern—Fascination.
 Forget-me-not.
 Fuchsia, Scarlet—Taste.
 Geranium, Horseshoe—Stupidity.
 Geranium, Scarlet—Consolation.
 Geranium, Rose—Preference.
 Golden-rod—Be cautious.
 Heliotrope—Devotion.
 Hyacinth, White—Loveliness.

Hyacinth, Purple—Sorrow.
Ivy—Friendship.
Lily, Day—Coquetry.
Lily, White—Sweetness.
Lily, Yellow—Gayety.
Lily, Water—Purity of heart; elegance.
Lily of the Valley—Unconscious sweetness.
Mignonette—Your qualities surpass your charms.

Monkshead—Danger is near.
Myrtle—Love.
Oak—Hospitality.
Orange Blossoms—Chastity.
Pansy—Thoughts.
Passion Flower—Faith.
Primrose—Inconstancy.
Rose—Love.
Rose, Damask—Beauty ever new.
Rose, Yellow—Jealousy.
Rose, White—I am worthy of you.
Rosebud, Moss—Confession of love.
Smilax—Constancy.
Straw—Agreement.
Straw, Broken—Broken agreement.
Sweet Pea—Depart.
Tuberose—Dangerous pleasures.
Thistle—Sternness.
Verbena—Pray for me.
White Jasmine—Amiability.
Witch Hazel—A spell.

IN COMBINATIONS.

| 12 Calendar Months..... | = 1 Year. |
| 365 Days..... | = 1 Common Year. |
| 366 Days..... | = 1 Leap Year. |

ANGULAR MEASURE.

| | | | |
|---------------------|---------------|--------------------------|-----|
| 60 Seconds. | = 1 Minute. | 4 Quadrants, or 360°.... | = 1 |
| 60 Minutes. | = 1 Degree. | Circumference, or Great | |
| 30 Degrees. | = 1 Sign. | Circle. | |
| 90 Degrees. | = 1 Quadrant. | | |

CUBIC OR SOLID MEASURE.

| | |
|------------------------------|--------------------------|
| 1728 Cubic Inches..... | = 1 Cubic Foot. |
| 27 Cubic Feet..... | = 1 Cubic Yard. |
| 40 Do. of Rough, or | } = 1 Ton or Load. |
| 60 Do. of Hewn Timber | |
| 42 Cubic Feet of Timber..... | = 1 Shipping Ton. |
| 104 Cubic Feet..... | = 1 Stack of Wood. |
| 128 Cubic Feet..... | = 1 Cord of Wood. |
| 40 Cubic Feet..... | = 1 Ton Shipping. |

LIQUID MEASURES.

| | Gals. | Qts. | Pts. |
|---|-------|------|------|
| Four Gills, one Pint..... | 1 | 4 | 1 |
| Quart..... | 1 | 4 | 2 |
| Gallon..... | 1 | 4 | 8 |
| Firkin or Quarter Barrel..... | 9 | 36 | 72 |
| Kilderkin or Half Barrel..... | 18 | 72 | 144 |
| Barrel..... | 36 | 144 | 288 |
| Hogshead of Ale ($1\frac{1}{2}$ barrel)..... | 54 | 216 | 432 |
| Punchon..... | 72 | 288 | 576 |
| Butt of Ale (8 barrels)..... | 108 | 432 | 864 |

Practically, the only measures in use are gallons and quarts, the others are merely nominal; *e. g.*, the hogshead of 54 gallons, *old measure*, contains but 52 gallons, 1 quart, 1 pint, and 3.55 gills imperial measure, and of wine six nominal quart bottles go to the gallon. Of imported wines the following are the usual measurements:—

| | |
|----------------------------------|----------------|
| Pipe of Port or Masdeu..... | = 115 Gallons. |
| Teneriffe..... | = 109 " |
| Marsala..... | = 93 " |
| Madeira and Cape..... | = 92 " |
| Butt of Lisbon and Bucellas..... | = 117 " |
| " Sherry and Tent..... | = 108 " |
| Aum of Hock and Rhenish..... | = 30 " |
| Hogshead of Claret..... | = 46 " |

DRY OR CORN MEASURE.

| | |
|-------------------------------|---------------|
| 4 Quarts..... | = 1 Gallon. |
| 2 Gallons..... | = 1 Peck. |
| 4 Pecks..... | = 1 Bushel. |
| 3 Bushels (four of corn)..... | = 1 Sack. |
| 12 Sacks..... | = 1 Chaldron. |
| 8 Bushels, or two sacks..... | = 1 Quarter. |
| 5 Quarters..... | = 1 Load. |

MEASURES OF WEIGHT.—*Avoirdupois*.

| | | |
|-----------------|------------------------------|-----------|
| 27½ Grains..... | = 1 Drachm = 27½ | } Grains. |
| 16 Drachms..... | = 1 Ounce = 437½ | |
| 16 Ounces..... | = 1 Pound = 7000 | } Grains. |
| 8 Pounds..... | = 1 Stone of Butcher's Meat. | |
| 14 Pounds..... | = 1 Ordinary Stone. | |
| 28 Pounds..... | = 1 Quarter (qr.). | |
| 4 Quarters..... | = 1 Hundredweight (cwt.). | |
| 20 Cwt..... | = 1 Ton. | |

This weight is used in almost all commercial transactions, and common dealings.

TROY WEIGHT.

| | |
|----------------------|----------------------|
| 3½ Grains..... | = 1 Carat. |
| 24 Grains..... | = 1 Pennyweight. |
| 20 Pennyweights..... | = 1 Ounce...480 grs. |
| 12 Ounces..... | = 1 Pound...5760 " |

HAY AND STRAW.

| | |
|--|--|
| Truss of Straw, 36 lb. | |
| Truss of Old Hay, 56 lb. | |
| Truss of New Hay, 60 lb. | |
| Load, 36 Trusses = Straw, 11 cwt. 2 qrs. 8 lb.; Old Hay, 18 cwt.; New Hay, 19 cwt. 1 qr. 4 lb. | |

WOOL.

| | Cwt. | Qr. | Lb. |
|---------------|----------------|-----|------|
| 7 Pounds..... | = 1 Clove..... | 0 | 7 |
| 2 Cloves..... | = 1 Stone..... | 0 | 14 |
| 2 Stones..... | = 1 Tod..... | 0 | 1 |
| 6½ Tods..... | = 1 Wey..... | 1 | 2 14 |
| 12 Sacks..... | = 1 Last..... | 39 | 0 0 |

Boxes of Different Measure.—A box 24 inches long by 16 inches wide, and 28 inches deep, will contain a barrel (3 bushels).

A box 24 inches long by 16 inches wide, and 14 inches deep, will contain half a barrel.

A box 16 inches square, and 8 2-5 inches deep, will contain one bushel.

A box 16 inches by 8 2-5 inches wide, and 8 inches deep, will contain half a bushel.

A box 8 inches by 8 2-5 inches square, and 8 inches deep, will contain one peck.

A box 8 inches by 8 inches square, and 4 1-5 inches deep, will contain one gallon.

A box 7 inches by 4 inches square, and 4 4-5 inches deep, will contain half a gallon.

A box 4 inches by 4 inches square, and 4 1-5 inches deep, will contain one quart.

In purchasing anthracite coal, 20 bushels are generally allowed for a ton.

The Longest Tunnels.—The Mount St. Gothard Tunnel, Italy, is 48,840 feet long, or nearly 10 miles long, and the longest in the world.

Mount Cenis Tunnel, Italy, is 39,840 feet long, or about seven and one-half miles long.

Hoosac Tunnel, Mass., is 25,080 feet long, or about 4½ miles.

The Nochistongo Tunnel, is 21,659 feet long, or about four miles.

The Sutro Tunnel is 21,120 feet long, or four miles.

Thames and Medway, Eng., is 11,880 feet long, or about two miles.

| Lima, Peru, 12.00 m. | |
| London, Eng., 5.07 p. m. | |

Alcoholic Liquors.—A table of the comparative consumption of alcoholic liquors was compiled by the London *Times* recently, with some interesting results. The average yearly consumption per head is given in liters (a liter is a little less than a quart):—

| | Spirits. Liters. | Wine. Liters. | Beer. Liters. |
|--------------------------------|------------------|---------------|---------------|
| Canada.... | 3.08 | 0.29 | 8.51 |
| Norway..... | 3.90 | 1.00 | 15.30 |
| United States..... | 4.79 | 2.64 | 31.30 |
| Great Britain and Ireland..... | 5.37 | 2.09 | 143.92 |
| Austria-Hungary..... | 5.76 | 22.40 | 28.42 |
| France..... | 7.28 | 119.20 | 21.10 |
| Russia..... | 8.08 | Unknown. | 4.65 |
| Sweden..... | 8.14 | 0.38 | 11.00 |
| German Zollverein..... | 8.60 | 6.00 | 65.00 |
| Belgium..... | 9.20 | 3.70 | 189.20 |
| Switzerland..... | 15.30 | 55.00 | 37.50 |
| Netherlands..... | 9.67 | 2.57 | 27.00 |
| Denmark..... | 18.90 | 1.00 | 33.33 |

Belgium, it seems, contains the greatest number of beer drinkers, with Great Britain second in this list, and Germany, contrary to common opinion, only third. France drinks the most wine, and Switzerland comes next, while the amount accredited to the United States, though comparatively small, yet exceeds that of Great Britain. Canada is the most moderate drinker of all.

Cost of the British Royal Family.—

The annuities paid by the British people to the royal family for its support are as follows: The Queen, \$1,925,000; Prince of Wales, \$200,000; Princess of Wales, \$50,000; Dowager Empress Frederick of Germany, \$40,000; Duke of Edinburgh, \$50,000; Princess Christian, \$30,000; Princess Louise, \$30,000; Duke of Connaught, \$125,000; Princess Beatrice, \$30,000; Duke of Cambridge (the Queen's cousin), \$60,000; Duchess of Albany, \$30,000; Duchess of Mecklenburg-Strelitz (the Queen's cousin), \$15,000; children of the Prince of Wales, \$180,000. Total, \$2,765,000. The Queen also receives the revenues of the Duchy of Lancaster. During recent years these have amounted to about \$250,000 per annum. When the royal children marry, dowries are usually provided for them. The last of the Queen's children to marry, Princess Beatrice, received \$150,000 as dowry from the British people by Parliamentary grant. The Duchess of Teck, the Queen's cousin, who died in 1897, enjoyed an annuity of \$25,000.

Library of Congress.—The new building for the Library of Congress was provided for by an act of Congress, approved April 15, 1886. The library was opened to the public in the new building in November, eleven years later. The actual cost of the building was \$6,032,124.54, or \$213,443.40 less than the limit fixed by law. The book shelving is 231,680 running feet, or about 44 miles, which will accommodate 2,000,000 volumes. When completely filled, the library, without encroaching on pavilions, reading rooms, or exhibition halls, will accommodate 4,500,000 volumes, occupying a little less than 100 miles of shelving. The library embraces 800,000 printed books, in which is included the law library of 100,000 volumes. There are also 240,000 pamphlets, 25,000 original manuscripts, 60,000 graphic arts, 210,000 pieces of music, 45,000 bound volumes of newspapers and periodicals. There is also a pavilion for the blind, open daily, with a special library of books in raised letters.

Most Notable Bridges.—Brooklyn bridge was commenced, under the direction of W.A. Roebling, in 1870, and completed in about thirteen years. It is 3,475 feet long and 135

feet high. The cost of building was nearly \$15,000,000.

The cantilever bridge, over the Niagara, is built almost entirely of steel. Its length is 910 feet; the total weight is 3,000 tons, and the cost was \$900,000.

The Niagara suspension bridge was built by Roebling, in 1852-55, at a cost of \$400,000. It is 245 feet above water, 821 feet long, and the strength is estimated at 1,200 tons.

The bridge at Havre de Grace, over the Susquehanna, is 3,271 feet long, and is divided into twelve wooden spans, resting on granite piers.

The Britannia bridge crosses the Menai strait, Wales, at an elevation of 103 feet above high water. It is of wrought iron, 1,511 feet long, and was finished in 1850. Cost, \$3,008,000.

The new London bridge is constructed of granite, from the designs of L. Rennier. It was commenced in 1824, and completed in about seven years, at a cost of \$7,291,000.

The old London bridge was the first stone bridge. It was commenced in 1176, and completed in 1209. Its founder, Peter of Colechurch, was buried in the crypt of the chapel erected on the center pier.

Coalbrookdale bridge, England, is the first cast iron bridge. It was built over the Severn in 1779.

The bridge at Burton, over the Trent, was formerly the longest bridge in England, being 1,545 feet. It is now partly removed. Built in the twelfth century.

The Rialto, at Venice, is said to have been built from the designs of Michael Angelo. It is a single marble arch, 98 1-2 feet long, and was completed in 1591.

The Bridge of Sighs, at Venice, over which condemned prisoners were transported from the hall of judgment to the place of execution, was built in 1589.

The Bridge of the Holy Trinity, at Florence, was built in 1569. It is 322 feet long, constructed of white marble, and stands unrivaled as a work of art.

The covered bridge at Pavia, over the Ticino, was built in the fourteenth century. The roof is held by 100 granite columns.

The St. Louis bridge, over the Mississippi, is 1,524 feet long, exclusive of approaches. There are three arched spans of cast steel, the center arch being 520 feet, with a rise of 47 1-2 feet; and the side spans 502 feet each, with a rise of 46 feet. The width on top, between rails, is 50 feet. The piers rest on the bedrock of the river, 136 feet below high water mark. Captain James B. Eads was the engineer.

Rush street bridge, Chicago, Ill., erected in 1884, at a cost of \$132,000, is the largest general traffic drawbridge in the world. Its roadway will accommodate four teams abreast, and its footways are seven feet wide.

The Victoria bridge, Montreal, one of the most famous in the world, is nearly two miles in length.

The Cleveland (O.) viaduct is 3,211 feet in length, 64 feet wide, 42 feet of which is roadway; the drawbridge is 332 feet in length, 46 feet wide, and is 68 feet above ordinary stage of water.

JURISDICTION OF JUSTICES OF THE PEACE.

Justices of the Peace generally have jurisdiction throughout the county or township in which they are elected, and the limit of the amount is as follows:—

| | | | |
|---------------------------|-------|---------------------|-------|
| Alabama..... | \$100 | Mississippi..... | \$200 |
| Arizona..... | 300 | Missouri..... | 250 |
| Arkansas..... | 300 | Montana..... | 800 |
| California..... | 300 | Nebraska..... | 200 |
| Colorado..... | 300 | Nevada..... | 300 |
| Connecticut..... | 100 | New Hampshire..... | 134 |
| Dakota, North..... | 200 | New Jersey..... | 200 |
| Dakota, South..... | 100 | New Mexico..... | 100 |
| Delaware..... | 200 | New York..... | 200 |
| District of Columbia..... | 300 | North Carolina..... | 200 |
| Florida..... | 100 | Ohio..... | 300 |
| Georgia..... | 100 | Oregon..... | 250 |
| Idaho..... | 300 | Pennsylvania..... | 300 |
| Illinois..... | 200 | Rhode Island..... | 100 |
| *Indiana..... | 200 | South Carolina..... | 100 |
| Iowa..... | 100 | Tennessee..... | 500 |
| Kansas..... | 300 | Texas..... | 200 |
| Kentucky..... | 100 | Utah..... | 300 |
| Louisiana..... | 100 | Vermont..... | 200 |
| Maine..... | 20 | Virginia..... | 100 |
| Maryland..... | 100 | Washington..... | 100 |
| Massachusetts..... | 1000 | West Virginia..... | 300 |
| Michigan..... | 300 | *Wisconsin..... | 200 |
| Minnesota..... | 100 | Wyoming..... | 200 |

* By confession, \$300. † By consent, \$300. ‡ Cities and counties exceeding 50,000, \$300; 300,000, \$500.

The President's Salary.—Most people believe that the \$50,000 a year which the president gets as his salary is the sum total. This is a mistake. \$36,064 is given him, in addition to his salary of \$50,000, to pay the salaries of his subordinates and clerks. His private secretary is paid \$3,250, his assistant private secretary, \$2,250; his stenographer, \$1,800; five messengers, each, \$1,200; a steward, \$1,800; two doorkeepers, each, \$1,200; four other clerks, at good salaries; one telegraph operator, two ushers, \$1,200 and \$1,400; a night usher, \$1,200; a watchman, \$900; and a man who takes care of the fires, who receives \$864 a year. In addition to this, there is given him \$8,000 for incidental expenses, such as stationery, carpets, and the care of the presidential stables. And under another heading there is given him nearly \$40,000 more. Of this, \$12,500 is for repairs and re-furnishing the White House; \$2,500 is for fuel; \$4,000 is for the greenhouse, \$15,000 is for gas,

matches, and the stable. The White House, all told, costs the country, in connection with the president, considerably over \$125,000 a year.

Insanity.—It is estimated that the number of insane persons in the United States is 168,900; in Germany, 108,100; in France, 93,900; in England, 81,600; in Russia, 80,000; Italy, 44,100; Austria, 35,000; Ireland, 19,500; Scandinavia, 18,100; Spain and Portugal, 13,000; Scotland, 11,600; Belgium and Holland, 10,400; Canada, 7,300; Australia, 4,900; Switzerland, 3,100.

Causes of Insanity.—Hereditary, 24 per cent.; drink, 14 per cent.; business, 12 per cent.; loss of friends, 11 per cent.; sickness, 10 per cent.; various, 29 per cent.

The above result is the medium average arrived at on comparing the returns for the United States, England, France, and Denmark.

* With suburbs.

NOTE.—The population of Chinese cities other than Canton, Peking, and Shanghai is omitted, because reports respecting it are utterly untrustworthy. There are forty or more Chinese cities whose inhabitants are numbered by rumor at from 200,000 to 1,000,000 each, but no official censuses have ever been taken; and, setting aside consideration of the Oriental tendency to exaggeration, there is reason to believe that the estimates of population in many instances covered districts of country bearing the same names as the cities, instead of definite municipalities.

The American Indian.

From the report of the United States Bureau of Indian Affairs.

| | | | | | | | |
|------------------|--------|------------------|--------|----------------------|--------|---------------------|---------|
| Arizona | 40,189 | Kansas | 1,211 | New York | 5,334 | Utah | 2,111 |
| California | 11,431 | Michigan | 7,557 | North Carolina | 1,436 | Washington | 9,827 |
| Colorado | 935 | Minnesota | 8,952 | North Dakota | 8,276 | Wisconsin | 10,726 |
| Florida | 575 | Montana | 10,076 | Oklahoma | 13,926 | Wyoming | 1,642 |
| Idaho | 3,557 | Nebraska | 3,854 | Oregon | 4,063 | Miscellaneous | 849 |
| Indian Ter | 86,265 | Nevada | 8,321 | South Dakota | 19,212 | | |
| Iowa | 385 | New Mexico | 9,480 | Texas | 290 | Total | 270,544 |

Of the above 98,199 wore citizen's dress and 32,846 wore a mixture of Indian and civilized clothing. Those who could read numbered 46,044 and 57,975 could carry on an ordinary conversation in English. The Indian population increased about 30,000 between 1890 and 1900.

INDIAN POPULATION IN DETAIL.

The total Indian population of the United States, exclusive of Alaska, but including 32,567 counted in the general census, being the taxed or taxable Indians, numbers 249,273. The following table gives the division of the Indians in detail:—

| | |
|---|----------------|
| Indians on reservations or at school, under control of the Indian office (not taxed or taxable) | 133,382 |
| Indians incidentally under the Indian office, and self-supporting:— | |
| The five civilized tribes, Indians and colored—Cherokees, 29,599; Chickasaws, 7,182; Choctaws, 14,397; Creeks, 14,632; Seminoles, 2,561; total, 68,371. Total Indians, 52,065; total colored Indian citizens and claimants, 14,224; grand total | 66,228 |
| Pueblos of New Mexico | 5,278 |
| Six Nations, Saint Regis, and other Indians of New York | 5,304 |
| Eastern Cherokees of North Carolina | 2,885 |
| Indians taxed or taxable, and self-sustaining citizens, counted in the general census (98 per cent. not on reservations) | 32,567 |
| Indians under control of the War Department, prisoners of war (Apaches at Mount Vernon Barracks) | 384 |
| Indians in State or Territorial prisons | 184 |
| Total | 249,273 |

"Uncle Sam."—The practice of calling the United States Government "Uncle Sam" is believed to have originated in the following manner: During the Revolutionary war a man named Samuel Wilson was a beef inspector at Troy, N. Y., and was very popular with the men in his employ, who always called him Uncle Sam. After the inspection of the beef, it was shipped by him to a contractor named Elbert Anderson, and was always marked "E. A. U. S." A joking workman, being asked what those letters were the abbreviations of, replied that he did not know, unless they were for Elbert Anderson and "Uncle Sam." The joke was kept up and spread, until it became common to refer to all packages marked "U. S." as belonging to "Uncle Sam."

Rubicon, the ancient name of a small stream—thought to be the modern Fiumicino—which formed the boundary between Italy and Cisalpine Gaul. It is celebrated from Cæsar's having hesitated about crossing it with his army, and initiating civil war, in the year 49 B. C. When he came to the river he paused upon the brink, but finally, saying, "The die is cast!" he spurred on his horse, and dashed into the water. Hence, "To pass the Rubicon" has become a proverbial phrase, to denote the taking of the first step in a momentous undertaking, from which one cannot or will not recede.

Illegitimacy.—The percentage of illegitimate births for various countries, as stated by Mulhall, is as follows: Austria, 12.9; Denmark, 11.2; Sweden, 10.2; Scotland, 8.9; Norway, 8.05; Germany, 8.04; France, 7.02; Belgium, 7.0; United States, 7.0; Italy, 6.8; Spain and Portugal, 5.5; Canada, 5.0; Switzerland, 4.6; Holland, 3.5; Russia, 3.1; Ireland, 2.3; Greece, 1.6.

Positivism.—The system of philosophy known as positivism, taught by Auguste Comte (1799-1857), discarding the possibility of knowing the beginning and the end of anything, concerns itself only with what lies between. It accepts neither atheism, theism, nor pantheism. It may be divided into two parts: The historic conception and the co-ordination of the sciences. The former is this: That the human mind passes through three stages, viz., the theological, the metaphysical, and the positive. In all subjects capable of experiment it passes from metaphysics to experi-

mental verification or exact science. In regard to the co-ordination of the sciences the basis is mathematics; then follow astronomy, physics, chemistry, biology, and sociology. Take the last: The science of society is impossible without the science of life. The science of life is impossible without chemistry. Chemistry presupposes physics, physics astronomy, and astronomy mathematics.

The Defective Classes.—*The Insane.*—The census returns of 1900 of defective classes have not yet been published, but are in course of preparation and are promised in 1906.

The total number of insane in the United States on June 1, 1890 (census of the United States), was 106,485—whites, 99,719; negroes, 6,535; Chinese, Japanese, and civilized Indians, 231. The number of insane males was 53,473, and of insane females 53,012. The total number of insane reported in 1880 was 91,959. The number of insane in each 100,000 of the population in 1890 was 387.0 for the foreign whites, 140.5 for the native whites, and 88.6 for the colored. In 1880 the corresponding figures were 398.8, 161.9, and 91.2.

The proportion of insanity was much greater among the whites than among the negroes, and very much greater among the foreign born than among the native born.

The number of insane in asylums in 1890 was 74,028—whites, 69,729; negroes, 4,299. The number of insane in asylums in each 1,000 of insane was: whites, 699; negroes, 658.

The number of insane admitted to public institutions from 1881 to 1899, inclusive, was 190,458. The number admitted to private institutions in the same period, 13,888.

Reports from thirty states to the Committee on States of the National Conference of Charities and Correction showed 102,000 insane persons in 1896. At this rate the whole United States would have 145,000 insane.

The Feeble Minded.—The total number of feeble minded in the United States on June 1, 1890, was 95,609—whites, 84,997 (native born, 75,910; foreign born, 9,087); negroes, 10,574; males, 52,962; females, 42,647.

The Deaf and Dumb.—The total number of deaf mutes in the United States on June 1, 1890, was 40,592—whites, 37,447; negroes, 3,115; others, 30; males, 22,429; females, 18,163; native born whites, 33,278; foreign born whites, 4,169.

The number of persons so deaf as to be unable to hear loud conversation on June 1, 1890, was 121,178, of whom 80,611 were able to speak. The latter were 49,278 males, 31,338 females; 77,308 whites, 3,808 negroes.

The Blind.—The total number of blind in the United States on June 1, 1890, was 50,508—whites, 43,351; negroes, 7,060; others, 157; males, 28,080; females, 22,488; native born whites, 34,205; foreign born whites, 9,146. Number of blind in one eye only, 93,988.

The number of insane persons in Great Britain and Ireland in 1896, according to Mulhall, was 128,896, or 328 per 100,000 population; Austria (1890), 51,880; Hungary (1890), 28,158. Number insane in Germany in 1884, 108,100; France, 93,900; Russia, 80,000.

Holidays.*—The legal holidays in the United States are as follows:—

New Year's Day, January 1. In all states and territories, except Arkansas, Delaware, Georgia, Kentucky, Maine, Massachusetts, New Hampshire, North Carolina, South Carolina, and Rhode Island.

Anniversary of the Battle of New Orleans, January 8. In Louisiana.

Lincoln's Birthday, February 12. In Louisiana.

Washington's Birthday, February 22. In all states and territories except Alabama, Arkansas, Florida, Illinois, Iowa, Indiana, Kansas, Maine, Missouri, North Carolina, Ohio, Texas, Oregon, and Tennessee.

Shrove Tuesday, March 1. In Louisiana, and cities of Mobile, Montgomery, and Selma, Ala.

Anniversary of Texan Independence, March 2. In Texas.

Firemen's Anniversary, March 4. In Louisiana.

Good Friday, April 15. In Florida, Louisiana, Minnesota, and Pennsylvania.

Memorial Day, April 26. In Georgia.

* For later and revised list of holidays by states see page 229.

Battle of San Jacinto, April 21. In Texas.
Decoration Day, May 30. In Colorado, Maine, Vermont, Connecticut, Michigan, New Hampshire, New Jersey, Rhode Island, New York, Pennsylvania, and District of Columbia.
Fourth of July. In all states and territories.

General Election Day, generally on Tuesday after first Monday in November. In California, Maine, Missouri, New Jersey, New York, Oregon, South Carolina, and Wisconsin.

Thanksgiving Day, usually last Thursday in November, and Fast days whenever appointed by the president are legal holidays in all states and territories.

Christmas Day. In all the states and territories.

Labor Day, first Monday in September. All states.

The World's Seven Wonders. — The seven wonders of the world are: The Pyramids, the Colossus of Rhodes, Diana's Temple at Ephesus, the Pharos of Alexandria, the Hanging Gardens at Babylon, the Statue of the Olympian Jove, and the Mausoleum by Artemisia at Halicarnassus. The Pyramids are numerous, and space forbids anything like even a list of them. The great piles were

constructed of blocks of red or syenitic granite and of a hard calcareous stone. These blocks were of extraordinary dimensions, and their transportation to the sites of the pyramids and their adjustment in their places, indicate a surprising degree of mechanical skill. The Great Pyramid covers an area of between twelve and thirteen acres. The masonry consisted originally of 89,028,000 cubic feet, and still amounts to about 82,111,000 feet. The present vertical height is 450 feet, against 479 feet originally, and the present length of the sides is 746 feet, against 764 feet originally. The total weight of the stone is estimated at 6,816,000,000 tons. The city of Rhodes was besieged by Demetrius Poliorcetes, King of Macedon, but, aided by Ptolemy Soter, King of Egypt, the enemy were repulsed. To express their gratitude to their allies and to their tutelary deity, they erected a brazen statue to Apollo. It was 105 feet high, and hollow, with a winding staircase that ascended to the head. After standing fifty-six years, it was overthrown by an earthquake, 224 years before Christ, and lay nine centuries on the ground, and then was sold to a Jew by the Saracens, who had captured Rhodes, about the middle of the seventh century. It is said to have required nine hundred camels to remove the metal, and from this statement it has been calculated its weight was 720,000 pounds. The Temple of Diana, at Ephesus, was built at the common charge of all the Asiatic States. The chief architect was Chersiphon, and Pliny says that 220 years were employed in completing the temple, whose riches were immense. It was 425 feet long, 225 broad, and was supported by 125 columns of Parian marble (sixty feet high, each weighing 150 tons), furnished by as many kings. It was set on fire on the night of Alexander's birth by an obscure person named Erostratus, who confessed on the rack that the sole motive which prompted him was the desire to transmit his name to future ages. The temple was again built, and once more burned by the Goths in their naval invasion, A. D. 256. The colossal statue of Jupiter in the temple of Olympia, at Elis, was by Phidias. It was in gold and ivory, and sat enthroned in the temple for 800 years, and was finally destroyed by fire about A. D. 475. From the best information, it is believed that the Mausoleum at Halicarnassus was a rectangular building surrounded by an Ionic portico of thirty-six columns, and surmounted by a pyramid, rising in twenty-four steps, upon the summit of which was a colossal marble quadriga with a statue of Mausolus. The magnificent structure was erected by Artemisia, who was the sister, wife, and successor of Mausolus.

The Blarney Stone.—Blarney is a village in Ireland, in the County of Cork, about five miles from the far famed city of that name. It is chiefly celebrated as giving the name to a peculiar kind of eloquence which is said to be characteristic of the light-hearted natives of the Emerald Isle. The old castle at Blarney contains the identical stone, the kissing of which is believed to give the person peculiar skill in speech. It is one of those superstitions which can be traced back until the mind of man runneth not to the contrary.

The Coal Area of the World.—The coal area of the world is distributed as follows:—

| Sq. Miles. | Sq. Miles. |
|----------------------------|----------------------------|
| United States.....192,000 | Germany.....1,800 |
| British America.....18,000 | Belgium.....518 |
| Great Britain.....12,000 | Rest of Europe.....100,000 |
| Spain.....4,000 | China.....2,000 |
| France.....2,000 | Japan.....5,000 |

Salaries Paid to Heads of Governments.—Various governments pay their chiefs as follows: The United States, \$50,000 a year; Persia, \$30,000,000; Russia, \$10,000,000; Siam, \$10,000,000; Spain, \$3,900,000; Italy, \$3,000,000; Great Britain, \$3,000,000; Morocco, \$2,500,000; Japan, \$2,300,000; Egypt, \$1,575,000; Germany, \$1,000,000; Saxony, \$700,000; Portugal, Sweden, and Brazil, each \$600,000; France, \$200,000; Hayti, \$240,000; Switzerland, \$3,000.

Train Management.—STANDARD CODE. —A train while running must display two green flags by day and two green lights by night, one on each side of the rear of the train.

After sunset, or when obscured by fog or other cause, must display headlight in front, and two red lights in rear.

Two green flags by day and two green lights by night, displayed in the places provided for that purpose on the front of an engine, denote that the train is followed by another train running on the same schedule, and entitled to the same time-table rights as the train carrying the signals.

Two white flags by day or two white lights by night, carried in the same manner, denote that the train is an extra.

A blue flag by day and a blue light by night, placed on the end of a car, denotes that car inspectors are at work under or about the car or train, and that it must not be coupled to or moved until the blue signal is removed.

Colored Flag or Lantern Signals — Torpedoes. STANDARD CODE.—Red signifies danger.

Green signifies caution, go slowly.

White signifies safety.

Green and white signifies stop at flag stations for passengers or freight.

One cap or torpedo on rail means stop immediately.

Two caps or torpedoes on rail means reduce speed immediately, and look out for danger signal.

Telescopes.—The largest refracting telescope in the world was presented by Charles T. Yerkes to the University of Chicago, in 1893. It has a lens 40 inches in diameter. The column and head of cast iron rise to a height of 43 feet, and weigh 50 tons. The tube is of steel, 64 feet long, and 52 inches in diameter at the center, tapering towards the ends. Its weight is 6 tons. The total weight of the telescope is 75 tons. Cost \$250,000. The lens of the telescope at Lick Observatory is 36 inches in diameter. The largest reflector is that of Lord Ross in England, 72 inches.

Divorces in Different Countries.—In Australia divorces have never been sanctioned.

Divorces are scarcely ever known to occur in modern Greece.

In Hindostan either party, for a slight cause, may leave the other party and marry.

In the olden times the Jews had a discretionary power of divorcing their wives.

Divorces are scarcely allowed in Thibet, unless with the consent of both parties. Remarriage is forbidden.

In Cochín China the parties desiring divorce break a pair of chopsticks in the presence of witnesses, and the thing is done.

Two kinds of divorces are granted in Circassia. By the first, the parties can immediately marry again; by the second, not for a year.

Among some tribes of American Indians the sticks given witnesses of the marriage are broken as a sign of divorce.

If the wife of a Turkoman asks his permission to go out, and he says "Go," without adding, "Come back again," they are divorced.

In Siberia, if a man is dissatisfied with the most trifling acts of his wife, he tears a cap or veil from her face, and that constitutes a divorce.

In Siam the first wife may be divorced, but not sold as the others may be. She may claim the first child. The others belong to the husband.

Among the Moors, if the wife does not become the mother of a boy, she may be divorced with the consent of the tribe, and can marry again.

In the Arctic regions a man who wants a divorce leaves home in anger, and does not return for several days. The wife takes the hint, and departs.

In China divorces are allowed in all cases of

criminality, mutual dislike, jealousy, incompatibility of temperament, or too much loquacity on the part of the wife.

Among the Tartars, if the wife is ill-treated, she complains to the magistrate, who, attended by the principal people, accompanies her to the house and pronounces a divorce.

Books were originally made of boards, or the inner bark of trees; afterwards of skins and parchment. Papyrus, an indigenous plant, was adopted in Egypt. Books with leaves of vellum were invented by Attalus, king of Pergamus, about 198 B. C., at which time books were in volumes or rolls. The MSS. in Herculaneum consists of papyrus, rolled and charred and matted together by the fire, and are about nine inches long, and one, two, or three inches in diameter, each being a separate treatise. The first printed books were printed on one side only, the leaves being pasted back to back.

Title pages to printed books in England were not introduced until shortly before 1490; they were used by Wynkyn de Worde, but not by Caxton in the fifteenth century.

The prices of ancient books were enormous. Jerome (who died 420 A. D.) states that he had ruined himself by buying a copy of the works of Origen. A large estate was given by Alfred the Great for a book on cosmography, about 872. The *Roman de la Rose* was sold for about £30; and a homily was exchanged for 200 sheep and five quarters of

wheat. Books frequently brought double or treble their weight in gold. In 1400 they sold at prices varying from £10 to £40 each.

Bookbinding is supposed to have begun about 650 A. D., the earliest to be bound being the book of St. Cuthbert. A Latin Psalter was bound in oak boards in the ninth century. Velvet was the covering in the fourteenth century, and silk soon after. Vellum was introduced early in the fifteenth century; and leather came into use about the same time.

Minimum Weights of Produce.—The following are minimum weights of certain articles of produce, according to the laws of the United States:—

| Per Bushel. | Per Bushel. |
|------------------------|-----------------------------|
| Wheat, 60 lbs. | Dried Apples, 25 lbs. |
| Corn, in the ear, 70 " | Clover Seed, 60 " |
| Corn, shelled, 56 " | Flax Seed, 56 " |
| Rye, 56 " | Millet Seed, 50 " |
| Buckwheat, 48 " | Hungarian Grass Seed, 50 " |
| Barley, 48 " | Timothy Seed, 45 " |
| Oats, 32 " | Blue Grass Seed, 44 " |
| Pease, 60 " | Hemp Seed, 44 " |
| White Beans, 48 " | Salt (see note below), 48 " |
| Castor Beans, 60 " | Corn Meal, 24 " |
| White Potatoes, 55 " | Ground Pease, 38 " |
| Sweet Potatoes, 57 " | Malt, 20 " |
| Onions, 55 " | Bran, 20 " |
| Turnips, 33 " | |
| Dried Peaches, 33 " | |

Salt.—Weight per bushel as adopted by different states ranges from 50 to 80 pounds. Coarse salt in Pennsylvania is reckoned at 80 pounds, and in Illinois at 50 pounds per bushel. Fine salt in Pennsylvania is reckoned at 62 pounds, in Kentucky and Illinois at 55 pounds per bushel.

* This estimate is of a very general nature, and affords no index to the disposable volume of land remaining nor the amount available for agricultural purposes. It includes Indian and other public reservations, unsurveyed private land claims, as well as surveyed private land claims, in the districts of Arizona, California, Colorado, and New Mexico; the sixteenth and thirty-sixth sections reserved for common schools; unsurveyed lands embraced in railroad, swamp land, and other grants; the great mountain areas; the areas of unsurveyed rivers and lakes, and large areas wholly unproductive and unavailable for ordinary purposes.

Present Population of the States and Territories.

CENSUS OF 1900.*

The Language of Gems.—*Amethyst.*—Peace of mind. Regarded by the ancients as having the power to dispel drunkenness.

Bloodstone.—I mourn your absence. Worn by the ancients as an amulet or charm, on account of the medicinal and magical virtues it was supposed to possess.

Diamond.—Pride. Awarded supernatural

qualities from the most remote period down to the middle ages. Has the power of making men courageous and magnanimous. Protects from evil spirits. Influences the gods to take pity upon mortals. Maintains concord between husband and wife, and for this reason was held as the most appropriate stone for the espousal ring.

Emerald.—Success in love. Mentioned in the Bible as worn in the breastplate of the High Priest as an emblem of chastity.

Ruby.—A cheerful mind. An amulet against poison, sadness, evil thoughts. A preservative of health. Admonishes the wearer of impending danger by changing color.

Sapphire.—Chastity. Procures favor with princes. Frees from enchantment. Prevents impure thoughts.

Topaz.—Fidelity. Calms the passions.

Turquoise.—Success and happiness. Preserves from contagion.

Garnet.—Fidelity in every engagement.

Onyx.—Reciprocal love.

Opal.—Pure thoughts.

Pearl.—Purity and innocence.

Public Lands Vacant July 1, 1901.

* The unreserved lands in Alaska are mostly unsurveyed and unappropriated.

† This aggregate is exclusive of Ohio, Indiana, Illinois, and Iowa, in which, if any public land remains, it consists of a few small isolated tracts. It is also exclusive of military and Indian reservations, reservoir sites, and timber reservations, and tracts covered by selections, filings, railroad grants, and claims as yet unadjudicated, a part of which may in the future be added to the public domain.

Railroad selections made during the fiscal year ended June 30, 1897, were, in acres: Arizona, 91,518.95; Arkansas, 7,024.14; California, 42,579.52; Colorado, 108,877.71; Florida, 281.29; Idaho, 86,526.60; Kansas, 55,770.65; Louisiana, 165.84; Minnesota, 52,698.93; Mississippi, 42,371.55; Montana, 46,318.85; Nebraska, 639.92; Nevada, 647,898.54; North Dakota, 1,313.81; Oregon, 13,766.86; Utah, 46,657.62; Washington, 114,868.55; Wisconsin, 29,552.21; Wyoming, 149,682.69; Total, 1,538,464.23.

Bartholdi's Statue of Liberty.—The figure of this statue, which is made of repoussé, or hammered work—that is, thin sheets of copper beaten into shape and fastened about an iron skeleton—is 110 1-2 feet high and weighs 100,000 pounds. The uplifted torch, however, is raised 26 feet, and adding to this the pedestal, the tip of the torch is raised 220 feet from the ground. The pedestal is of

stone, 82 feet high. Some idea of the enormous proportions of the statue may be given from the fact that the forefinger is 8 feet long and 4 feet in circumference at the second joint. The head is 14 feet high, and 40 persons can stand in it.

The Great Wall of China runs from a point of the Gulf of Liaotung, an arm of the Gulf of Pechili, in Northeastern China, westerly to the Yellow river, thence makes a great bend to the south for nearly one hundred miles, and then runs to the northwest for several hundred miles to the Desert of Gobi. Its length is 1,500 miles. For the most of this distance it runs through a mountainous country, keeping on the ridges, and winding over many of the highest peaks. In some places it is only a formidable rampart, but most of the way it is composed of lofty walls of masonry and concrete, or impacted lime and clay, from twelve to sixteen feet in thickness, and from fifteen to thirty or thirty-five feet in height. The top of this wall is paved for hundreds of miles, and crowned with crenelated battlements and towers thirty to forty feet high. In numerous places the wall climbs such steep declivities that its top ascends from height to height in flights of granite steps. An army could march on the top of the wall for weeks and even months, moving in some places ten men abreast.

Most Northern Point Reached by Arctic Explorers.—The following table shows the furthest points of north latitude reached by Arctic explorers:—

| Year. | Explorers. | North Latitude. |
|------------|------------------------------|-----------------|
| 1697. | Hudson. | 80d. 23m. 00s. |
| 1773. | Phipps (Lord Musgrove). | 80d. 48m. 00s. |
| 1806. | Scoreaby. | 81d. 12m. 42s. |
| 1827. | Farr. | 82d. 45m. 30s. |
| 1874. | Meyer (on land). | 82d. 09m. 00s. |
| 1875. | Markham (Nare's expedition). | 83d. 30m. 26s. |
| 1876. | Fayer. | 83d. 07m. 00s. |
| 1884. | Lockwood (Greely's party). | 83d. 24m. 00s. |
| 1883-96. | Nansen. | 86d. 13m. 36s. |
| 1899-1900. | Duke of Abruzzi. | 86d. 33m. |

The distance from the farthest point of polar discovery to the pole itself is 3 degrees and 27 minutes, or, in round numbers, 240 miles, which is only about twenty miles greater than the distance from New York to Washington, by the line of the Pennsylvania railroad, over which the traveler rides in about five hours. But this polar radius, though only 240 miles in extent, is covered by ice gorges and precipices of incredible difficulty; and frost is so severe that no instrument of human invention can measure its intensity, and it blisters the skin like extreme heat.

The greatest progress that has ever been made across these wildernesses of storm, of fury and desolation, was at the rate of five or six miles in a day, the explorers often necessarily

resting as many days as they had before traveled miles in a single day, debarred by the obstacles that they had encountered.

* Includes Newfoundland.

† Including Alaska and Hawaii, 81,590.

The Five Wits.—An old and curious standard of mentality is that which credits mankind with having "five wits": common wit, imagination, fantasy, estimation, and memory.

1. *Common wit* is that inward sense which judges what the five senses simply discern: thus the eye sees, the nose smells, the ear hears, and so on, but it is "common wit" that informs the brain and passes judgment on the goodness or badness of these external matters.

2. *Imagination* works on the mind, causing it to realize what has been presented to it.

3. *Fantasy* energizes the mind to act in accordance with the judgment thus pronounced.

4. *Estimation* decides on all matters pertaining to time, space, locality, relation, and so on.

5. *Memory* enables the mind to retain the recollection of what has been imparted.

On shipboard, for purpose of discipline and to divide the watch fairly, the crew is mustered in two divisions; the Starboard (right side, looking toward the head) and the Port (left). The day commences at noon, and is thus divided: Afternoon Watch, noon to 4 P. M.; First Dog Watch, 4 P. M. to 6 P. M.; Second Dog Watch, 6 P. M. to 8 P. M.; First Watch, 8 P. M. to Midnight; Middle Watch, Midnight to 4 A. M.; Morning Watch, 4 A. M. to 8 A. M.; Forenoon Watch, 8 A. M. to noon. This makes seven Watches, which enables the crew to keep them alternately, as the Watch which comes on duty at noon one day has the afternoon next day, and the men who have only four hours' rest one night have eight hours the next. This is the reason for having Dog Watches, which are made by dividing the hours between 4 P. M. and 8 P. M. into two Watches. Time is kept by means of "Bells" although sometimes there is but one Bell on the ship.

Pawnbroker's Sign, Origin of.—It is generally held that the three golden balls used by pawnbrokers as a sign were adopted from the armorial bearings of the Medici family of Italy by the Lombard merchants, among whom were several representatives of that family. This sign was used in London in very early times by some of those merchants who had emigrated from Italy and established the first money-lending establishments in England.

Indian Folklore.—As a specimen of the folklore of our own aborigines none can surpass in interest the story of Hiawatha, the

prophet-teacher, son of Mudjekeewis (*the west wind*) and Wenonah, daughter of Nokomis. He represents the progress of civilization among the North American Indians. Hiawatha first wrestled with Mondamin (*maize*), and, having subdued it, gave it to man for food. He then taught man navigation; then he subdued Mishe Nahma (*the sturgeon*), and taught the Indians how to make oil therefrom for winter. His next exploit was against the magician Megissognon, the author of disease and death; having slain this monster, he taught men the science of medicine. He then married Minnehaha (*laughing water*), and taught man to be the husband of one wife, and the comforts of domestic peace. Lastly, he taught man picture-writing. When the white man came with the gospel, Hiawatha ascended to the kingdom of Ponemah, the land of the hereafter. Among many other accomplishments, when Hiawatha put on his moccasins, he could measure a mile at a single stride.

He had moccasins enchanted,
Magic moccasins of deer-skin;
When he bound them round his ankles
At each stride a mile he measured!

—LONGFELLOW, *Hiawatha*, iv.

Barber's Pole.—The spiral red stripe on a barber's pole is said to symbolize the winding of a ribbon or bandage around the arm of a patient upon whom the barber had operated in the capacity of surgeon. In former times, when the operation of bleeding was extensively practiced, blood-letting formed a part of the duties of a barber.

Caste Among the Hindoos.—Caste is a term applied to the division into social classes in India. To each of these classes certain pursuits are limited by the Laws of Manu, B. C. 960. 1. The *Brahmans* or sacerdotal class, which "issued from the mouth of Brahma."

2. The *Chuttree* or military class, which "sprang from the arm of Brahma."

3. The *Bais* or mercantile class, which "sprang from the thigh of Brahma."

4. The *Sudras* or servile class, which "sprang from the foot of Brahma."

The *Pariahs* and *Chandalas* are nobodies, or worse, for it is pollution to be touched by such "scum of the earth."

American Flags.—It is related that the flag which was raised at Cambridge, January 2, 1776, by Washington, was composed of thirteen red and white stripes, with the crosses of St. George and St. Andrew emblazoned on the blue canton in place of the stars. This flag was also carried by the fleet under command of Commander Esek Hopkins, when it sailed from the Delaware Capes, February 17, 1776. In the following year, June 14, 1777, the conti-

mental Congress passed a resolution "That the flag of the United States be thirteen stripes, alternate red and white; that the Union be thirteen stars, white on a blue field, representing a new constellation." How or by whom the idea of the star was first suggested is uncertain, although there are some who ascribe it to John Adams, while others claim the entire flag was borrowed from the coat of arms of the Washington family. In this flag the stars were arranged in a circle, although no form was officially prescribed. It is supposed that the first display of the National flag at a military post was at Fort Schuylers, on the site of the village of Rome, Oneida county, N. Y. The fort was besieged early in the month of August, 1777, and the garrison were without a flag. So they made one according to the prescription of Congress, by cutting up sheets to form the white stripes, bits of scarlet cloth for the red stripes, and the blue ground for the stars was composed of portions of a cloth cloak belonging to Capt. Abraham Swarthout, of Dutchess county, N. Y., and the flag was unfurled August 3, 1777. Paul Jones, as commander of the "Ranger," to which he was appointed, June 14, 1777, claimed that he was the first to display the stars and stripes on a naval vessel. It is probable that the flag was first unfurled in battle on the banks of the Brandywine, September 11, 1777, the first battle after its adoption. It first appeared over a foreign stronghold, June 28, 1778, when Captain Rathbone, of the American sloop of war "Providence," captured Fort Nassau, New Providence, Bahama Islands. John Singleton Copley, the American painter, claimed to be the first to display the flag in Great Britain. On the day when George III. acknowledged the independence of the United States (December 5, 1782), he painted the flag in the background of a portrait of Elkanah Watson. To Captain Mooers, of the whaling ship "Bedford," of Nantucket, is doubtless due the honor of first displaying the stars and stripes in a port of Great Britain. He arrived in the Downs with it flying at the fore, February 3, 1783. When Vermont and Kentucky were added to the Union of States, the flag was altered, the number of stripes and stars being increased from thirteen to fifteen. In 1818 a new flag, having thirteen stripes and a star for every state, twenty at that time, was devised by Capt. Samuel C. Reed, and this has remained the form of the United States flag.

Harbors.—San Francisco may fairly claim to have the most capacious natural harbor of any of the world's great trading marts. It is also one of the very safest. It is entered through the Golden Gate, a passage a mile wide,

and thirty-five feet deep at low tide — admitting the largest ships afloat without danger of grounding. The landlocked bay, of which this harbor is part, is fifty miles long, and averages five miles in width. There all the shipping of the entire globe could anchor in perfect safety. Port Philip Bay, the chief harbor of Victoria, Australia, is larger than the bay of San Francisco, being about thirty-eight miles long by thirty-three broad, but its very breadth, with its surroundings, leaves it exposed to storms from certain quarters. Port Jackson, on which Sydney, New South Wales, Australia, is located, is a magnificent harbor, completely landlocked, extending inland in some places fully twenty miles, and having ample depth of water for vessels of the heaviest burden. The harbors of New York city, Rio Janeiro, Brazil, and Havana, Cuba, are capacious and secure. Next come those of Boston, Norfolk, Va., Portland, Me., Halifax, N. S., Copenhagen, Constantinople, Hong Kong, Yokohama, and Nagasaki. The great ports situated on the banks of rivers, such as London, Liverpool, Glasgow, Lisbon, Philadelphia, New Orleans, Quebec, Shanghai, Canton, Calcutta, etc., are not included in the definition of harbors as here considered.

Bunker Hill Monument.— The corner stone of this monument was laid on the fiftieth anniversary of the battle of Bunker Hill, June 17, 1825, by Lafayette, and the oration was pronounced by Daniel Webster. It is a square shaft of Quincy granite, 221 feet high, 31 feet square at the base, and 15 feet at the top. Inside the shaft is a round, hollow cone, 7 feet wide at the bottom, and 4 feet 2 inches at the top, encircled by a winding staircase containing 224 stone steps, which leads to a chamber 11 feet in diameter immediately under the apex. The chamber has four windows, and contains two cannons, named Hancock and Adams, respectively, which were used in the war. The monument was completed and was dedicated June 17, 1843.

Commune, Paris, was an organized band of Socialists, who attempted to establish a revolutionary government in Paris in 1871. Before they were suppressed by the army of the republic, they became absolute masters of Paris, and committed atrocious acts of cruelty and vandalism. They arrested the Bishop of Paris and other prominent citizens, and imprisoned them. They set fire to the public buildings, and endeavored to destroy the ancient monuments and treasures of art. Among the buildings which were destroyed were the Tuileries, the Palais de Justice, the Palais Royal, and the Hotel de Ville, and the Louvre Gallery was partly burned. The Column Vendome, erected

in honor of Napoleon, was one of the first monuments to fall. Darboy, the Archbishop of Paris, Bonjean, President of the Court of Cassation, and others whom they held as hostages, were shot. In short, they seemed to be possessed with a very frenzy of hatred against all government and all order, and wantonly destroyed property and human life. The revolution was finally suppressed on May 27, and 25,000 of the Communists were taken prisoners, some of whom were put to death, while a large number were banished. In justice it must be said that the more intelligent and honest leaders of the Commune were discarded before the most atrocious acts were committed.

Alien Holders of Our Lands.— The following is a table of the leading alien holders of lands in the United States, with amount of holdings in acres:—

| | |
|---|-------------------|
| An English syndicate, No. 3, in Texas..... | 3,000,000 |
| The Holland Land Company, New Mexico..... | 4,500,000 |
| Sir Edw. Reid and a syndicate, Florida..... | 2,000,000 |
| English syndicate in Mississippi..... | 1,800,000 |
| Marquis of Tweeddale..... | 1,750,000 |
| Phillips, Marshall & Co., London..... | 1,300,000 |
| German-American syndicate, London..... | 750,000 |
| Bryan H. Evans, of London..... | 700,000 |
| Duke of Sutherland..... | 425,000 |
| British Land Company in Kansas..... | 320,000 |
| Wm. Wharley, M.P., Peterboro, England..... | 310,000 |
| Missouri Land Company, Edinburgh, Scotland..... | 300,000 |
| Robert Tennent, of London..... | 230,000 |
| Dundee Land Company, Scotland..... | 247,000 |
| Lord Dunmore..... | 120,000 |
| Benjamin Neugas, Liverpool..... | 100,000 |
| Lord Houghton in Florida..... | 60,000 |
| Lord Dunraven in Colorado..... | 60,000 |
| English Land Company in Florida..... | 50,000 |
| English Land Company in Arkansas..... | 50,000 |
| Albert Peel, M.P., Leicestershire, England..... | 10,000 |
| Sir J. L. Kay, Yorkshire, England..... | 5,000 |
| Alexander Grant, of London, in Kansas..... | 35,000 |
| English syndicate, Wisconsin..... | 110,000 |
| M. Ellerhauser, of Halifax, in West Virginia..... | 600,000 |
| A Scotch syndicate in Florida..... | 500,000 |
| A. Boysen, Danish consul in Milwaukee..... | 50,000 |
| Missouri Land Company, of Edinburgh..... | 165,000 |
| Total..... | 20,647,000 |

To these syndicate holdings, should be added the following: The Arkansas Valley Company in Colorado, a foreign corporation, whose inclosures embrace upwards of 1,000,000 acres; the Prairie Cattle Company (Scotch) in Colorado, upwards of 1,000,000; H. H. Metcalf, River Bend, Colorado, 200,000; John W. Powers, Colorado, 200,000; McDaniel & Davis, Colorado, 75,000; Routhler & Lamb, Colorado, 40,000; J. W. Frank, Colorado, 40,000; Garnett & Langford, Colorado, 30,000; E. C. Tane, Colorado, 50,000; Leivsey Brothers, Colorado, 150,000; Vrooman & McFife, Colorado, 50,000; Beatty Brothers, Colorado, 40,000; Chick, Brown & Company, Colorado, 30,000; Reynolds Cattle Company, Colorado, 50,000; several other cases in Colorado, embracing from 10,000 to 30,000; Coe & Carter, Nebraska, fifty miles of fence; J. W. Wilson, Nebraska, forty miles; J. W. Boster, twenty

miles; William Humphrey, Nevada, thirty miles; Nelson & Son, Nevada, twenty-two miles; Kennebec Ranch, Nebraska, from 20,000 to 50,000 acres.

Largest Islands in the World.

| | Area. Sq. miles. | Popu- lation. |
|--|---------------------|------------------|
| New Guinea..... | 325,000 | 690,000 |
| Borneo..... | 290,000 | 1,848,000 |
| Madagascar..... | 228,570 | 3,000,000 |
| Sumatra..... | 168,000 | 5,000,000 |
| Great Britain..... | 83,826 | 29,710,000 |
| Celebes..... | 66,750 | 4,000,000 |
| Java..... | 50,260 | 17,500,000 |
| Saghalien (used as a penal settlement only)..... | 47,500 | 13,500 |
| New Zealand, North Island..... | 44,760 | |
| " South Island..... | 55,324 | 570,000 |
| Cuba..... | 45,700 | 2,000,000 |
| Nippon (Japan)..... | 42,000 | 27,250,000 |
| Newfoundland..... | 40,200 | 180,000 |
| Luzon (Philippines)..... | 40,000 | 4,500,000 |
| Iceland..... | 40,000 | 72,438 |
| Jesso..... | 35,000 | 163,365 |
| Ireland..... | 31,874 | 4,456,546 |
| Hayti or San Domingo..... | 29,830 | 393,200 |
| Tasmania..... | 26,215 | 130,541 |
| Ceylon..... | 25,635 | 3,000,000 |
| Tierra del Fuego..... | 21,260 | 2,000 |

Government Salary List.—The salary of the president of the United States is \$50,000 a year; the vice-president, \$8,000; cabinet officers, \$8,000. Senators receive \$5,000 and mileage. Congressmen, \$5,000 and mileage. The Chief Justice of the Supreme Court receives \$10,500; Associate Justices, \$10,000. The diplomats get good pay: Ministers to Germany, Great Britain, France, and Russia, \$17,500; Ministers to Brazil, China, Austro-Hungary, Italy, Mexico, Japan, and Spain, \$12,000; Ministers to Chile, Peru, and Central America, \$10,000; Ministers to the Argentine Confederation, Belgium, Hayti, Colombia, Netherlands, Sweden, Turkey, and Venezuela, \$7,500; Ministers to Switzerland, Denmark, Paraguay, Bolivia, and Portugal, \$5,000; Ministers to Liberia, \$4,000. The heads of the government departments receive: Superintendent of Bureau of Engraving and Printing, \$4,500; Public Printer, \$4,500; Superintendent of Census, \$5,000; Superintendent of Naval Observatory, \$5,000; Superintendent of the Signal Service, \$4,000; Director of Geological Surveys, \$6,000; Director of the Mint, \$4,500; Commissioner of General Land Office, \$4,000; Commissioner of Pensions, \$3,600; Commissioner of Agriculture, \$3,000; Commissioner of Indian Affairs, \$3,000; Commissioner of Education, \$3,000; Commander of Marine Corps, \$3,500; Superintendent of Coast and Geodetic Survey, \$6,000.

In 1893 the Ministers to Great Britain, Germany, and France, were made Ambassadors without increase of pay.

The pay of army officers is fixed as follows: General, \$13,500; lieutenant general, \$11,000; major general, \$7,500; brigadier general, \$5,-

500; colonel, \$3,500; lieutenant colonel, \$3,000; major, \$2,500; captain, mounted, \$2,000; captain, not mounted, \$1,800; regimental adjutant, \$1,800; regimental quartermaster, \$1,800; first lieutenant, mounted, \$1,600; first lieutenant, not mounted, \$1,500; second lieutenant, mounted, \$1,500; second lieutenant, not mounted, \$1,400; chaplain, \$1,500. The navy salaries are: Admiral, \$13,000; vice-admiral, \$9,000; rear admiral, \$6,000; commodore, \$5,000; captain, \$4,500; commander, \$3,500; lieutenant commander, \$2,800; lieutenant, \$2,400; master, \$1,800; ensign, \$1,200; midshipman, \$1,000; cadet midshipman, \$500; mate, \$900; medical and pay director, and medical and pay inspector, and chief engineer, \$4,400; fleet surgeon, fleet paymaster, and fleet engineer, \$4,400; surgeon and paymaster, \$2,800; chaplain, \$2,500.

The White House.—The residence of the president of the United States is officially known as the Executive Mansion, which means that it is the residence of the head of the executive branch of the government; but it is seldom called, in ordinary talk, either by those who live in it, or by the American people in general, anything but the White House. This is a very unpretentious title, and it is interesting to note how the residence of the president, in a country which is full of white houses, came to bear this simple name as its special property.

The explanation is easily found. The first Executive Mansion at Washington was occupied in 1800. It was built of freestone, and was unpainted; but in 1814 the British army occupied Washington, and burned, with other public buildings, the president's house, leaving it a blackened ruin.

The house was rebuilt on the same site, and the same walls were used in its construction; but they were so discolored by smoke that, on the suggestion of General Jackson, they were painted white, not only to improve their appearance, but in token of the successful defiance of British fire by the American Republic.

The mansion soon became the "White House" in the mouths of the people, on account of its dazzling color, and from that day to this it has been repainted white every ten years. Its name commemorates a patriotic feeling, therefore, as well as serves to describe the appearance of the mansion, for the original coat of white paint was a sort of protest against the vandalism of the British, and every subsequent coat has served to perpetuate the protest.

Eagle as an Emblem.—In ancient mythology the eagle was believed to carry the souls of the dying to their abode on Mount Olympus, and was called the Bird of Jove.

The eagle was first taken as a symbol of royal power by the ancient Etruscans, who bore its image upon their standards. In the year 87 B. C. a silver eagle, with expanded wings, poised on the top of a spear, with a thunderbolt held in its claws, was adopted as the military standard to be borne at the head of their legions by the Romans. At the time of Hadrian a golden eagle was substituted for the silver one. A two-headed eagle was adopted by the Byzantine emperors as a symbol of their control of both the East and the West. The double-headed eagle of Russia was adopted on the marriage of Ivan I. with a Grecian princess of the Eastern empire; that of Austria was first used when the Emperor of Germany took the title of the Roman Emperor. The national standard of Prussia bears a black eagle, that of Poland a white one. Napoleon I. took a golden eagle for his standard, modeled of pure gold, and bearing a thunderbolt, after the pattern of the eagle of the Romans. This standard was disused under the Bourbons, but was restored by a decree of Louis Napoleon in 1852. The eagle was first used on American coins in 1788, on cents and half-cents issued from the Massachusetts mint. It was adopted in the plan of a national coinage as a design upon all gold coins, and on the silver dollar, half dollar, and quarter dollar. The design of an eagle was at one time suggested for the national flag, but was abandoned.

Knighthood, originally a military distinction, came, in the sixteenth century, to be occasionally conferred on civilians, as a reward for valuable services rendered to the crown or community. The first civil knight in England was Sir William Walworth, Lord Mayor of London, who won that distinction by slaying the rebel, Wat Tyler, in the presence of the king. The ceremonies practiced in conferring knighthood have varied at different periods. In general, fasting and bathing were in early times necessary preparatives. In the eleventh century, the creation of a knight was preceded by solemn confession and a midnight vigil in the church and followed by the reception of the Eucharist. The new knight offered his sword on the altar, to signify his devotion to the Church and determination to lead a holy life. The sword was redeemed in a sum of money, had a benediction pronounced over it, and was girded on by the highest ecclesiastic present. The title was conferred by binding the sword and spurs on the candidate, after which a blow was dealt him on the cheek or shoulder, as the last affront which he was to receive unrequited. He then took an oath to protect the distressed, maintain right against might, and never by word or deed to stain his

character as a knight or a Christian. Upon the infringement of any part of his oath a knight could be degraded, in which case his spurs were chopped off with a hatchet, his sword broken, his escutcheon reversed, and some religious observances were added during which each piece of armor was taken off in succession and cast from the recreant knight. Knighthood is now generally bestowed by a verbal declaration of the sovereign, accompanied with a simple ceremony of imposition of the sword.

Latin Union was formed in 1865 and originally embraced France, Italy, Belgium, and Switzerland, but was joined by Greece in 1868, Spain in 1871, and subsequently Servia and Roumania. The object of this combination was to regulate the amount of silver to be coined yearly in each country, and to secure a uniform coinage which would be received without discount throughout the Union. The unit of coinage in the Latin Union is the franc, and although it is known in other countries under different names the value is always the same. The perfect decimal system of France is also used. The convenience of this coinage system has led to its adoption by about 148,000,000 people. In 1874 the States, by mutual consent, practically suspended the coinage of silver.

Blue Stockings.—The term "blue stocking" originated in England about a century ago. Its invention is traced to the days of Doctor Johnson and was applied then as now to ladies who cultivated learned conversation, and found enjoyment in the discussion of questions which had been monopolized by men. It is said by Dr. John Doran, who, in his work "A Lady of the Last Century," gave an account of Mrs. Montagu and the "blue stockings" of her time, that in 1757 it was quite the thing for ladies to form evening assemblies, when they might participate in talk with literary and ingenious men. One of the best known and most popular members of one of these societies was said to have been a Mr. Stillingfleet, who always wore blue stockings, and when at any time he happened to be absent from these gatherings it was usually remarked that "we can do nothing without blue stockings"; and by degrees the term "blue stockings" was applied to all clubs of the kind described, and eventually to the ladies who attended their meetings.

Mound Builders.—It is generally believed that the Mississippi valley and the Atlantic coast were once populated by an agricultural and partially civilized race quite different from the nomadic Indians, though possibly the progenitors of some of the Indian

tribes, and that, after centuries of occupation, they disappeared—at least a thousand, and perhaps many thousand, years before the advent of Europeans. The theory has been advanced that these people migrated from Asia; that they passed over Asia to Siberia, across Behring Straits, down the Pacific coast of America from Alaska, and to the Mississippi valley, and down to Mexico, Central America, and Peru. The remains of the Mound Builders, as this vanished people are called, are scattered over most of the states of the central and lower Mississippi valley, along the banks of the Missouri, and on the sources of the Allegheny. They are most numerous in Ohio, Indiana, Illinois, Wisconsin, Missouri, Arkansas, Kentucky, Tennessee, Mississippi, Alabama, Georgia, Florida, Texas, and are found in the western part of New York, and in Michigan and Iowa. These mounds vary greatly in size, and in some instances are very extensive and exceedingly intricate, notably those of the Licking valley, near Newark, Ohio, which cover an area of two square miles; in other localities there are some which reach a height of ninety feet. It is not believed that these people had any written language, as no inscriptions or tablets yet discovered indicate this. Many of these mounds have been found to contain skeletons, numerous implements and ornaments, usually composed of stone, sometimes of copper—in its native state—and occasionally shell and bone; also coarse and rude pottery of curious design. In substantiation of the belief that these people came from Asia, is the fact that in Siberia mounds have been found similar to those in the Mississippi valley.

Vegetable Origins.—Spinach is a Persian plant.

Horse-radish is a native of England.

Melons were found originally in Asia.

Filberts originally came from Greece.

Quinces originally came from Corinth.

The turnip originally came from Rome.

The peach originally came from Persia.

Sage is a native of the south of Europe.

Sweet marjoram is a native of Portugal.

The bean is said to be a native of Egypt.

Damsons originally came from Damascus.

The nasturtium came originally from Peru.

The pea is a native of the south of Europe.

Ginger is a native of the East and West Indies.

The gooseberry is indigenous to Great Britain.

Coriander seed came originally from the East.

Apricots are indigenous to the plains of America.

The cucumber was originally a tropical vegetable.

The walnut is a native of Persia, the Caucasus, and China.

Capers originally grew wild in Greece and northern Africa.

Pears were originally brought from the East by the Romans.

The clove is a native of the Malacca Islands, as is also the nutmeg.

Cherries were known in Asia as far back as the seventeenth century.

Garlic came to us first from Sicily and the shores of the Mediterranean.

Asparagus was originally a wild seacoast plant, and is a native of Great Britain.

The tomato is a native of South America, and it takes its name from a Portuguese word.

Parsley is said to have come from Egypt, and mythology tells us it was used to adorn the head of Hercules.

Apples were originally brought from the East by the Romans. The crab apple is indigenous to Great Britain.

The onion was almost an object of worship with the Egyptians 2,000 years before the Christian era. It first came from India.

Cloves came to us from the Indies, and take their name from the Latin *clauvis*, meaning a nail, to which they have a resemblance.

The cantaloupe is a native of America, and so called from the name of a place near Rome, where it was first cultivated in Europe.

Lemons were used by the Romans to keep moths from their garments, and in the time of Pliny they were considered an excellent poison. They are a native of Asia.

Slavery in the North.—The first state to abolish slavery within her borders was Vermont, which adopted a plan for gradual emancipation in 1777, before she had joined the Union, and in 1800 slavery in that state had entirely ceased. The new Massachusetts constitution, adopted in 1780, contained a clause declaring that "all men are born free and equal, and have certain natural, essential, and inalienable rights, among which may be reckoned the right of enjoying and defending their lives and liberties," which had the effect of freeing all the slaves, a very small number, then held within the borders of that state. In 1780 there were 4,000 slaves in Pennsylvania, and in that year their gradual emancipation was provided for by legislative enactment. Sixty-four of these were still living in bondage, however, in 1840. Rhode Island and Connecticut followed the example of Pennsylvania, and the former had but five slaves left in 1840, and the latter seventeen. New York passed a gradual emancipation act in 1799, at

which time she had upward of 20,000 slaves, and slavery was totally abolished in the state from July 4, 1827. In 1850 there were still 236 persons living in bondage in New Jersey, although the state had adopted the gradual emancipation plan in 1804. The census of 1810 showed that there were no slaves held in Massachusetts, New Hampshire, or Vermont, New Hampshire having emancipated the few slaves held in the state, between 1800 and 1810. In Pennsylvania, New York, and New Jersey, large numbers of slaves who could not be held in those states were nefariously sold to Southern slave dealers by unprincipled owners, notwithstanding the fact that each state had adopted, at the time of emancipation, the most stringent laws regarding the exportation of slaves. By the census of 1860 it was shown that slavery was entirely abolished north of Mason and Dixon's line.

Mardi-Gras.—The Mardi-Gras is the festival preceding the first day of Lent, or Ash Wednesday. Most of the distinctive ceremonies now annually performed in New Orleans were originally introduced by the French population as early as 1827. The day is a legal holiday, and the entire city is for the time ostensibly placed under the control of a king of the carnival, the great "Rex." There are two principal pageants. The first, in the daytime, is the escort of the "beloved Rex," through his favorite city; the other, or night pageant, is known as the "Mystic Krewe of Comus." This has a character altogether unique. The first display was in 1857. On Twelfth night (January 6), the "Knights of Momus" have a display analogous to the Mardi-Gras, but more exclusively burlesque, and in which they satirize the follies of the age. The arrangements for these celebrations come within the control of quite an elaborate organization. The Mardi-Gras is held on Shrove Tuesday, a day of pleasure in most Roman Catholic countries. It is the carnival of the Italians, the Mardi-Gras of the French, and the Pancake Tuesday of former times in England.

Suicides.—In European cities the number of suicides per 100,000 inhabitants is as follows: Paris, 42; Lyons, 29; St. Petersburg, 7; Moscow, 11; Berlin, 36; Vienna, 23; London, 23; Rome, 6; Milan, 6; Madrid, 8; Genoa, 31; Brussels, 15; Amsterdam, 14; Lisbon, 2; Christiania, 25; Stockholm, 27; Constantinople, 12; Geneva, 11; Dresden, 51. Madrid and Lisbon show the lowest, Dresden the highest, figure. The average annual suicide-rate in countries of the world per 100,000 persons living is given by Barker as follows: Saxony, 31.1; Denmark, 25.8; Schleswig-Holstein, 24.0; Austria, 21.2; Switzerland, 20.2; France, 15.7; German Empire, 14.3; Hanover, 14.0; Queensland, 13.5; Prussia, 13.3; Victoria, 11.5; New South Wales, 9.8; Bavaria, 9.1; New Zealand, 9.0; South Australia, 8.9; Sweden, 8.1; Norway, 7.5; Belgium, 6.9; England and Wales, 6.9; Tasmania, 5.3; Hungary, 5.2; Scotland, 4.0; Italy, 3.7; Netherlands, 3.6; United States, 3.5; Russia, 2.9; Ireland, 1.7; Spain, 1.4.

The causes of suicide in European countries are reported as follows: Of 100 suicides: Madness, delirium, 18 per cent.; alcoholism, 11; vice, crime, 19; different diseases, 2; moral sufferings, 6; family matters, 4; poverty, want, 4; loss of intellect, 14; consequences of crimes, 3; unknown reasons, 19.

The number of suicides in the United States, six years, 1882-87, was 8,226. Insanity was the principal cause, shooting the favorite method; 5,386 acts of suicide were committed in the day, and 2,419 in the night. Summer was the favorite season, and the 11th the favorite day of the month. The month in which the largest number of suicides occurs is July.

The number of suicides in twenty American cities in 1897 was as follows: New York, 436; Chicago, 384; Brooklyn, 194; St. Louis, 162; Philadelphia, 146; Boston,

92; Cincinnati, 69; Baltimore, 60; Providence, 16; Cleveland, 54; Washington, 52; Milwaukee, 62; Minneapolis, 34; New Orleans, 40; Buffalo, 23; Pittsburg, 33; Jersey City, 24. Total, with ten smaller cities, 2,014. The same cities in 1896, 1,999; increase 15, or .75 of one per cent. These figures are by Frederick L. Hoffman, in the *New York Spectator* for July 1, 1898.

Facts About the Earth.—According to Clark, the equatorial semi-diameter is 20,926,202 feet=3,963,296 miles, and the polar semi-diameter is 20,854,895 feet=3,950,738 miles. One degree of latitude at the pole=69.407 miles. One degree of latitude at the equator=68.704 miles.

POPULATION OF THE EARTH BY CONTINENTS.

| CONTINENTAL DIVISIONS. | Area in Square Miles. | INHABITANTS. | |
|------------------------|-----------------------|---------------|---------------|
| | | Number. | Per Sq. Mile. |
| Africa..... | 11,514,000 | 127,000,000 | 11.0 |
| America, North..... | 6,446,000 | 89,250,000 | 13.8 |
| America, South..... | 6,837,000 | 36,420,000 | 5.3 |
| Asia..... | 14,710,000 | 850,000,000 | 57.7 |
| Australasia..... | 3,288,000 | 4,780,000 | 1.4 |
| Europe..... | 3,555,000 | 380,200,000 | 106.9 |
| Polar Region..... | 4,888,800 | 800,000 | 0.7 |
| Total..... | 51,238,800 | 1,487,900,000 | 29.0 |

The above estimate was made by Ernest George Ravenstein, F.R.G.S., the geographer and statistician, and is for 1890.

An estimate of population of the earth, made by Drs. Wagner and Supan, editors of *Bevölkerung der Erde* (Perthes, Gotha, 1891), is as follows: Europe, 357,379,000; Asia, 825,954,000; Africa, 168,963,000; America, 121,713,000; Australia, 3,230,000; Oceanic Islands, 7,420,000; polar regions, 80,400. Total, 1,479,729,400. The estimate of area of the continents and islands by the same authorities is 52,821,684.

Ravenstein's estimate of the earth's fertile region, in square miles, is 28,269,200; steppe, 13,901,000; desert, 4,180,000; polar regions, 4,888,800.

The population of the earth at the death of the Emperor Augustus, estimated by Bodio, was 54,000,000. The population of Europe hardly exceeded 50,000,000 before the fifteenth century.

The area and cubic contents of the earth, according to the data of Clark, given above, are: Surface, 196,971,984 square miles; cubic contents, 259,944,035,515 cubic miles.

Murray (Challenger expedition) states the greatest depth of the Atlantic Ocean at 27,366 feet; Pacific Ocean, 30,000 feet; Indian Ocean, 18,582 feet; Southern Ocean, 25,200 feet; Arctic Ocean, 9,000 feet. The Atlantic Ocean has an area, in square miles, of 24,588,000; Pacific Ocean, 50,309,000; Indian Ocean, 17,084,000; Arctic Ocean, 4,781,000; Southern Ocean, 30,592,000. The highest mountain is believed to be Deodhunga, one of the Himalayas, 29,002 feet. Lord Kelvin estimates the age of the solid earth to be between 20,000,000 and 30,000,000 years, and of the human race the same.

POPULATION OF THE EARTH ACCORDING TO RACE.

(Estimated by John Bartholomew, F.R.G.S., Edinburgh.)

| RACE. | LOCATION. | NUMBER. |
|-----------------------------|--------------------------------|---------------|
| Indo-Germanic or Aryan..... | Europe, Persia, etc. | 545,500,000 |
| Mongolian or Turanian..... | Greater Part of Asia | 680,000,000 |
| Semitic or Hamitic..... | North Africa, Arabia | 65,000,000 |
| Negro and Bantu..... | Central Africa..... | 150,000,000 |
| Hottentot and Bush | South Africa..... | 150,000 |
| Malay and Polynesian..... | Australasia and Polynesia..... | 55,000,000 |
| American Indian.... | North and South America..... | 15,000,000 |
| Total..... | | 1,440,655,000 |

The human family is subject to forty-five principal governments. As to their form, they may be classified

as follows: Absolute monarchies, China, Korea, Morocco, Persia, Siam, Turkey; limited monarchies, Austria-Hungary, Belgium, British Empire, Denmark, Germany, Greece, Italy, Japan, Netherlands, Portugal, Roumania, Servia, Sweden, Norway, Spain; republics, Argentina Republic, Bolivia, Brazil, Chile, Colombia, Costa Rica, Ecuador, France, Guatemala, Hayti, Honduras, Mexico, Nicaragua, Paraguay, Peru, Salvador, San Domingo, Switzerland, Transvaal, United States of America, Uruguay, Venezuela. In 1906 Russia adopted a form of popular representation. Besides these, are the undefined despotisms of Central and South Africa, and a few insignificant independent States.

The average duration of human life is about 33 years. One quarter of the people on the earth die before age 6, one half before age 16, and only about 1 person of each 100 born, lives to age 65. The deaths are calculated at 67 per minute, 97,790 per day, and 35,639,835 per year; the births, at 70 per minute, 100,800 per day, and 36,792,000 per year.

GREAT EARTHQUAKES.

- 425 B. C.—One which made Euboea an island.
 345 B. C.—Duras in Greece and twelve cities in Campania buried.
 17 A. D.—Ephesus and other cities overturned.
 79 A. D.—One accompanying the eruption of Vesuvius and destruction of Herculaneum and Pompeii.
 115 A. D.—Antioch destroyed.
 157 A. D.—One hundred and fifty towns wrecked in Asia, Pontus, and Macedonia.
 557 A. D.—Thousands perished at Constantinople.
 742 A. D.—Terrible one in Syria, Palestine, and Asia. Immense loss of life.
 936 A. D.—Constantinople overturned; all Greece shaken.
 1137 A. D.—In Catania, Sicily; 15,000 perished.
 1158 A. D.—In Syria, etc.; 20,000 perished.
 1268 A. D.—In Cilicia; 60,000 perished.
 1318 A. D.—Greatest earthquake known in England.
 1456 A. D.—At Naples; 40,000 perished.
 1531 A. D.—At Lisbon; 80,000 buried.
 1626 A. D.—In Naples; 70,000 perished.
 1667 A. D.—At Schamaki; 80,000 perished.
 1693 A. D.—In Sicily; 354 cities, towns, and villages destroyed. More than 100,000 perished.
 1703 A. D.—In Jeddo (now Tokio), Japan; 200,000 perished.
 1716 A. D.—At Algiers; 20,000 perished.
 1731 A. D.—In China; 100,000 perished.
 1746 A. D.—Lima and Callao demolished; 18,000 buried.
 1754 A. D.—At Grand Cairo; 40,000 perished.
 1755 A. D.—November 1.—Great Lisbon earthquake. In about eight minutes most of the city and 50,000 people were destroyed. Other cities in Portugal, a large part of Malaga in Spain, one half of Fez in Morocco, and half the island of Madeira were ruined. Earthquake felt 5,000 miles away.
 1759 A. D.—In Syria; 20,000 perished.
 1797 A. D.—Country between Santa Fe and Panama destroyed, including Cuzco and Quito; 40,000 buried suddenly.
 1805 A. D.—At Frosolone, kingdom of Naples; 6,000 perished.
 1822 A. D.—Aleppo destroyed; over 20,000 perished.
 1822.—Coast of Chili permanently raised.
 1839.—At Martinique; nearly half of Port Royal destroyed.
 1842.—At Cape Haytien, San Domingo; between 4,000 and 5,000 perished.
 1851.—Melfi, Italy, wrecked; 14,000 perished.
 1852.—Manila, P. I., much property damaged.
 1857.—Montemuro and other towns in the kingdom of Naples destroyed; 10,000 perished. (Lacaita says that in 75 years, from 1733 to 1867, the kingdom of Naples lost at least 111,000 inhabitants by earthquakes, or more than 1,500 a year, out of an average population of 6,000,000.)
 1861.—At Mendoza, South America; about two-thirds of the city and 7,000 lives lost.
 1863.—Manila, P. I., great destruction of property; about 1,000 perished.
 1868.—Cities of Arequipa, Iquique, Tacna, and Chinha, and many small towns in Peru and Ecuador destroyed; about 25,000 perished; damage estimated at \$300,000,000.
 1872.—Inyo valley, California; several small towns destroyed.
 1874.—Cities in Guatemala destroyed; great loss of life.
 1878.—Shocks at Cologne and other parts of Germany and Holland.
 1880.—Severe shock at Brieg, Switz.; several killed.
 1883.—Java and neighboring isles desolated.

1884.—Severe shocks in eastern counties of England, centering at Colchester.

1884.—Slight shocks in the United States from Washington to New York.

1884.—Severe shocks in Andalusia and Malaga.

1884.—Several Spanish towns destroyed; 900 perished in Periana.

1885.—In province of Granada, Spain; 690 perished.

1886.—August 31.—Shocks throughout eastern United States; at Charleston, S. C., 41 lives and \$5,000,000 worth of property lost.

1886.—September-December.—Slight shocks at and around Charleston, causing panic.

1887.—Terrible shock in Southern Europe, especially in the Riviera; estimated that 2,000 perished.

1891.—Shock felt at San Francisco.

1891.—In Japan; officially estimated that 4,000 perished and that 50,000 houses were destroyed.

1893.—Islands of Zante and Stromboli, the former west of Greece, the latter one of the Lipari group, west of Calabria, Italy, severely shaken. Great loss of lives and property at Zante.

1893.—Shock in New Hampshire and Vermont.

1906.—On April 18, violent shocks in California wrecked San Francisco and adjacent towns. Bursting of water mains in San Francisco gave the city over to what was the greatest fire in all history, lasting two days. Area burned was over three times greater than that of the Chicago fire, and ten times that of either the Boston or the Baltimore fire. Over 1,000 lives were lost and \$300,000,000 of property destroyed; over 300,000 homeless. The whole business section of San Jose was destroyed, nineteen lives lost, and property valued at over \$8,000,000 destroyed. Santa Rosa was swept by fire; fifty lives were lost. At Agnews Insane Asylum 117 patients and nine attendants were crushed to death. Stanford University buildings were damaged to the extent of \$2,800,000, including the fine Memorial Church. Much damage was done to nearly all the towns in the Santa Clara, Napa, and Sonoma valleys.

Statistics of the Press.—Rowell's American Newspaper Directory reports the number of newspapers published in the United States and Canada as 23,265. Frequency of issue: Weekly, 16,595; monthly, 2,980; daily, 2,402; semi-monthly, 308; semi-weekly, 593; quarterly, 201; bi-weekly, 64; bi-monthly, 63; tri-weekly, 55—total, 23,265.

The total number of newspapers published in the world at present is estimated at about 60,000, distributed as follows: United States and Canada, 23,265; Germany, 8,049; Great Britain, 9,500; France, 6,681; Japan, 1,000;

Italy, 2,757; Austria-Hungary, 2,958; Asia, exclusive of Japan, 1,000; Spain, 1,000; Russia, 1,000; Australia, 1,000; Greece, 130; Switzerland, 1,005; Holland, 980; Belgium, 956; all others, 1,000. Of these, more than half are printed in the English language.

The Sacred Number.—Seven was frequently used as a mystical and symbolical number in the Bible, as well as among the principal nations of antiquity, the Persians, Indians, Egyptians, Greeks, and Romans. The origin is doubtless astronomical, or rather astrological, viz., the observation of the seven planets and the phases of the moon, changing every seventh day. As instances of this number in the Old Testament, we find the Creation completed within seven days, whereof the seventh was a day of rest kept sacred. Every seventh year was sabbatical, and the seven times seventh year ushered in the jubilee year. The three *Regalim*, or Pilgrim festivals (Passover, Festival of Weeks, and Tabernacles), lasted seven days, and between the first and second of these feasts were counted seven weeks. The first day of the seventh month was a "Holy Convocation." The Levitical purifications lasted seven days, and the same space of time was allotted to the celebration of weddings and the mourning for the dead. In innumerable instances in the Old Testament and later Jewish writings the number is used as a kind of round number. In the Apocalypse we have the churches, candlesticks, seals, stars, trumpets, spirits, all to the number of seven, and the seven horns and seven eyes of the Lamb. The same number appears again, either divided into half ($3\frac{1}{2}$ years, Rev. xiii. 5; xi. 3; xii. 6, etc.), or multiplied by ten—seventy Israelites go to Egypt, the exile lasts seventy years, there are seventy elders, and at a later period there are supposed to be seventy languages and seventy nations upon earth. To go back to the earlier documents, we find in a similar way the dove sent out the second time seven days after her first mission, Pharaoh's dream shows him twice seven kine, twice seven ears of corn, etc.

The Seven Churches of Rev. i.-iii. are Ephesus, Smyrna, Pergamos, Thyatira, Sardis, Philadelphia, and Laodicea.—The Seven Deadly Sins are pride, covetousness, lust, anger, gluttony, envy, and sloth.—The Seven Principal Virtues are faith, hope, charity, prudence, temperance, chastity, and fortitude.—The Seven Gifts of the Holy Ghost are wisdom, understanding, counsel, ghostly strength or fortitude, knowledge, godliness, and the fear of the Lord.

Among the Greeks the seven was sacred to Apollo and to Dionysus, who, according to

Orphic legends, was torn into seven pieces; and it was particularly sacred in Euboea, where the number was found to pervade, as it were, almost every sacred, private, or domestic relation. On the many ancient speculations which connected the number seven with the human body and the phases of its gradual development and formation, its critical periods of sicknesses,—partly still extant as superstitious notions—we cannot here dwell. The Pythagoreans made much of this number, giving it the name of Athene, Hermes, Hephaistos, Heracles, the Virgin unbegotten and unbegetting (i. e., not to be obtained by multiplication), Dionysus, Rex, etc. Many usages show the importance attached to this number in the eyes not only of ancient but even of our own times, and it is hardly necessary to add that the same recurrence is found in the folklore of every race.

Hippocrätēs (B. C. 460-357) divided the life of man into seven ages, a division adopted by Shakespeare.

The Egyptian priests enjoined rest on the seventh day, because it was held to be a *dies infaustus*. In Egyptian astronomy there were seven planets, and hence seven days in the week, each day ruled by its own special planet. The people of Peru had also a seven-day week.

The Persians and Mexicans have a tradition of a flood from which seven persons saved themselves in a cave, and by whom the world was subsequently repopled.

The seven Champions of Christendom are St. George for England, St. Andrew for Scotland, St. Patrick for Ireland, St. David for Wales, St. Denis for France, St. James for Spain, St. Anthony for Italy.

Maelstrom, The, which means, literally, "grinding stream," is situated on the Norwegian coast, southwest of the Loffoden Isles, and is the most remarkable whirlpool in the world. It runs between the island of Moskenes and a large solitary rock in the middle of the straits. The strong currents, rushing between the Great West Fjord and the outer ocean, through the channels of the Loffoden Isles, produce a number of whirlpools, of which the maelstrom is by far the most dangerous. During severe storms from the west, for instance, the current runs continually to the east at the rate of six knots an hour, without changing its direction for rising or falling tide, and the stream will boil and eddy in such mighty whirls that the largest steamer could hardly contend successfully with the waters. The depth of the whirlpool is only 20 fathoms, but just outside the straits soundings reach from 100 to 200 fathoms. The great danger to vessels is of course not of

suction into the heart of the whirlpool, as legends have supposed, but of being dashed to pieces against the rocks.

Lucky Horseshoe.—Most of the houses in the West End of London were protected against witches and evil spirits in the seventeenth century, says John Aubrey, the English antiquary, by having horseshoes fastened to them in various ways. It was the belief that then no witch or evil genius could cross the threshold which was protected by the shoe. The custom of nailing horseshoes, for luck, to all kinds of sailing craft is still, to a certain extent, in vogue, and we all know how fortunate it is considered for anyone to find a horseshoe, the good luck being increased by the number of nails that are attached to the shoe when it is picked up. This superstition can be traced back to about the middle of the seventeenth century, and then we find it lost in the obscurity of the ages.

Godiva, Lady, the wife of Leofric, Earl of Mercia and Lord of Coventry. About 1040 the earl imposed certain onerous services and heavy exactions upon the inhabitants of Coventry, who, in consequence, loudly complained. Lady Godiva, having the welfare of the town at heart, eagerly besought her husband to give them relief; and he, in order to escape from her importunities, said he would grant the favor, but only on condition that she would ride naked through the town. Greatly to her husband's surprise she agreed to the conditions; and on a certain day, after having ordered all the inhabitants to remain within doors and behind closed blinds, she rode through the town clothed only by her long hair. This circumstance was commemorated by a stained glass window, mentioned in 1690, in St. Michael's Church, Coventry; and the legend that an unfortunate tailor, the only man who looked out of a window, was struck blind, has also found commemoration in an ancient effigy of "Peeping Tom of Coventry," still to be seen in a niche of one of the buildings. For many years occasional representations were given of the ride of Lady Godiva, the character being taken by some beautiful woman, clothed, however, in considerable more than her hair, and attended by other historical and emblematic personages. The ceremony has now fallen into disrepute.

Molly Maguires.—The first organization of this name was formed in Ireland, with the object, it is believed, of generally misusing process-servers and others engaged in the prosecution and eviction of tenants, and was composed of young men who, in some localities, assumed women's clothing, blackened their faces, and otherwise disguised themselves. It remained, however, for the American "Mol-

lies" to terrorize whole counties, and leave a blood-red trail behind them in the coal regions of Pennsylvania. To give even a record of the murders and outrages they committed would require an entire volume; but they were numbered by hundreds, and the unfortunate victims were, in most cases, well known and respected men. The American organization was composed of the restless and reckless element drawn to the coal regions through the opening of the coal fields. There is no recorded instance where the disguise of women's clothes was assumed in the United States. Through the efforts of James McParlan, a detective, the secrets of the order were finally revealed, and many of its members were brought to justice.

Natural Storm Signals.—A continuous south wind in most localities will in a few days cause rain, because being warm, dense, and charged with moisture, it is rarefied and cooled by the atmosphere of more northern or elevated sections, and thus its capability of sustaining moisture is lessened. On the other hand, a continuous north wind dispels all rain signs for the time being. Flaky clouds, or low-running ones, from any direction but the north, denote rain or snow. Salmon, leaden, or silvery colored clouds denote falling weather; bright red, clear. When the sunset is followed by bright lances or streaks of light of various hues radiating from the point where the sun disappeared, continuing across the heavens and converging to a common point in the opposite horizon, there exists a storm-cloud in line with the sun, though it may be so distant as to be for a while entirely hidden from view by the rotundity of the earth. If the rays of light are evenly divided north and south of the line between the observer and the radiating point, and continue so until they have faded out, the cloud is approaching. When "heat-lightning" is visible there is a storm-cloud in the same direction, though it may not be seen nor thunder be heard. When the lightning is continuous and very brilliant the storm is a violent one, though the track of the destructive elements may be from 100 to 200 miles away.

Great Bells.—In the manufacture of great bells Russia has always taken the lead. The "Giant," which was cast in Moscow in the sixteenth century, weighed 288,000 pounds, and it required twenty-four men to ring it. It was broken by falling from its support, but was recast in 1654. On June 19, 1706, it again fell, and in 1732 the fragments were used, with new materials, in casting the "King of Bells," still to be seen in Moscow. This bell is nineteen feet, three inches high, measures around the margin sixty feet, nine inches,

weighs about 443,732 pounds, and its estimated value in metal alone is at least \$300,000. St. Ivan's bell, also in Moscow, is forty feet, nine inches in circumference, sixteen and one half inches thick, and weighs 127,830 pounds. The bells of China rank next to those of Russia in size. In Pekin there are seven bells, each of which is said to weigh 120,000 pounds. The weight of the leading great bells of the

world are as follows: "Great Bell of Moscow," 443,732 pounds; St. Ivan's, Moscow, 127,830 pounds; Pekin, 120,000 pounds; Vienna, 40,200 pounds; Olmutz, Bohemia, 40,000 pounds; Rouen, France, 40,000 pounds; St. Paul's, London, 38,470 pounds; "Big Ben," Westminster, 30,850 pounds; Montreal, 28,560 pounds; St. Peter's, Rome, 18,600 pounds.

Population of Great Britain and Ireland.

United States Army Recruiting Requirements.—Applicants for enlistment in the regular army must be between the ages of twenty-one and thirty years, unmarried, of good character and habits, able-bodied, free from disease, and must be able to speak, read, and write the English language. Age for enlistment of citizen soldiery, eighteen to forty-five years, married or unmarried.

Minors are not enlisted, except boys between the ages of sixteen and eighteen who may be needed as musicians and who have the written consent of father, only surviving parent, or legally appointed guardian.

Original enlistments are confined to persons

who are citizens of the United States, or who have made legal declaration of their intention to become citizens thereof.

For infantry and artillery the height must be not less than five feet four inches, and weight not less than 120 pounds and not more than 190 pounds.

For cavalry the height must be not less than five feet four inches and not more than five feet ten inches, and weight not to exceed 165 pounds.

All soldiers receive from the Government (in addition to their pay) rations, clothing, bedding, medicines, and medical attendance. The following is the rate of pay as now established:—

| | GRADE. | Pay per Month. | Pay per Year. | Pay per 3 Years. |
|--|--------|----------------|---------------|------------------|
| Privates—Cavalry, artillery, and infantry..... | | \$13 | \$156 | \$468 |
| Field Musicians—Cavalry, artillery, and infantry..... | | 13 | 156 | 468 |
| Wagoners—Cavalry, artillery, and infantry..... | | 14 | 168 | 504 |
| Artificers—Artillery and infantry, saddlers and farriers, cavalry..... | | 15 | 180 | 540 |
| Corporals—Cavalry, artillery, and infantry..... | | 15 | 180 | 540 |
| Sergeants—Cavalry, artillery, and infantry..... | | 18 | 216 | 648 |
| First Sergeant of a company—Cavalry, artillery, and infantry..... | | 25 | 300 | 900 |
| Chief Trumpeter of cavalry..... | | 22 | 264 | 792 |
| Principal Musician—Artillery and infantry..... | | 22 | 264 | 792 |

* The maximum pay of Colonels is limited to \$4,500, and of Lieutenant-Colonels to \$4,000.

The pay of non-commissioned officers is from \$18 to \$34 per month, and of privates \$13 per month.

United States National and International Salutes, with Cannon. Salute to the Union.— This is one gun for each state, and is commemorative of the Declaration of Independence. It is fired at noon of the Fourth of July, at every military post, and on board commissioned naval vessels belonging to the United States.

The National Salute, 21 guns. This is the salute for the national flag, the President of the United States, presidents of foreign republics, or sovereigns of foreign states, visiting the United States.

Vice-President of the United States, American and foreign ambassadors, 19 guns.

The President of the Senate, Speaker of the House of Representatives, Members of the Cabinet, the Chief Justice, a Congressional Committee, Governors within their respective states or territories, Viceroy or Governor General of provinces belonging to foreign states, General of the Army, Admiral of the Navy, and same ranks in foreign armies and navies, 17 guns.

American or foreign Envoys, or Ministers Plenipotentiary, Assistant Secretaries of the Navy or War, Lieutenant General, or a Major General commanding the army, and corresponding ranks in the navy, and foreign armies and navies, 15 guns.

Ministers-Resident accredited to the United States, Major General, Rear Admiral, and cor-

responding ranks of foreign armies and navies, 13 guns.

Chargés d'Affaires, Brigadier General, Commodore, and corresponding ranks in foreign armies and navies, 11 guns.

Consul Generals accredited to the United States, 9 guns.

Salutes are only fired between sunrise and sunset, and not on Sundays, except in international courtesies. The national colors are always displayed at the time of saluting. The salute of the flag is the only salute which is returned, and this must be done within twenty-four hours. United States vessels do not return salute to the flag in United States waters if there is any fort or battery there to do it, nor do United States vessels salute United States forts or posts.

If there are several batteries or forts within sight or six miles of each other, one of them is designated as the saluting fort, and returns all salutes of foreign men-of-war. In New York, Castle William, on Governor's Island, is the saluting fort.

Washington Monument. — Notwithstanding the fact that the plan of a monument to General Washington was approved by Congress in the latter part of December, 1799, nothing was done in the matter until 1833, when an association of prominent persons undertook the raising of the needed funds by subscription, and on July 4, 1848, had so far suc-

ceeded in their undertaking that the corner stone of a monument was laid, and during the succeeding eight years the shaft was carried to a height of 156 feet. The work was then suspended, at first for lack of funds, then because of the Civil War, and finally because the foundations were believed to be insecure. In 1876 Congress undertook the completion of the monument. The base was first strengthened, and the work of rebuilding the shaft was resumed in August, 1880, and was finished August 9, 1884. The shaft is 555 feet high, and the entire height of the monument, including the foundations, is 592 feet. The base is 55 feet 1½ inch square. At 500 feet above the ground the monument has four sides, each of which is 35 feet wide. Its area at this point is that of a comfortable six-room house, each room of which might be 12x16 feet. This square forms the base of the pyramidal top which runs from it 55 feet until it terminates in a metallic point. This point is constructed of the largest piece of aluminium ever made. The stones of which the monument is constructed are great blocks of crystal marble from Maryland, and in some cases are 9 feet long, 2 feet thick, and 3 or more feet wide. There are more than 18,000 of them. The foundation is built of Potomac gneiss, and is 81 feet square at the base. One hundred and eighty-one "memorial stones" have from first to last been contributed for use in the monument; but many were considered unworthy of a place, and one sent by Pope Pius IX., in 1855, was stolen during the Know-Nothing agitation, and was broken into pieces and thrown into the Potomac river. The monument was dedicated with imposing ceremonies on February 22, 1885. Its cost was about \$1,500,000, which was raised partially by an appropriation by Congress and partially by private subscription. It is 30 feet higher than any other work of man except the lofty iron Eiffel Tower erected in Paris for the great Exposition of 1889.

Origin of Visiting Cards.—As is the case in many other instances, we owe the invention of visiting cards to the Chinese. So long ago as the period of the Tong dynasty (618-907), visiting cards were in common use in China, and that is also the date of the introduction of the "red silken cords" which figure so conspicuously on the engagement cards of that country. From very ancient times to the present day the Chinese have observed the strictest ceremony with regard to the paying of visits. The cards which they use for this purpose are very large, and usually of a bright red color. When a Chinaman desires to marry, his parents intimate that fact to a professional

"match-maker," who thereupon runs through a list of her visiting acquaintances, and selects one whom she considers a fitting bride for the young man; and then she calls upon the young woman's parents, armed with the bridegroom's card, on which are inscribed his ancestral name and the eight symbols which denote the day of his birth. If the answer is an acceptance of the suit, the bride's card is sent in return; and should the oracles prophesy good concerning the union, the particulars of the engagement are written on two large cards, tied together with the red cords.

Gems Symbolic of the Months.—

January, the jacinth or hyacinth, symbolizing constancy and fidelity.

February, the amethyst, symbolizing peace of mind and sobriety.

March, the bloodstone or jasper, symbolizing courage and success in dangerous enterprise.

April, the sapphire and diamond, symbolizing repentance and innocence.

May, the emerald, symbolizing success in love.

June, the agate, symbolizing long life and health.

July, the carnelian, symbolizing cure of evils resulting from forgetfulness.

August, the sardonyx or onyx, symbolizing conjugal felicity.

September, the chrysolite, symbolizing preservation from folly, or its cure.

October, the aquamarine, opal, or beryl, symbolizing hope.

November, the topaz, symbolizing fidelity and friendship.

December, the turquoise or ruby, symbolizing brilliant success.

Some doubt exists between May and June, July and August. Thus some give the agate to May and the emerald to June; the carnelian to August, and the onyx to July.

Flying Dutchman, The, is the name given by sailors to a phantom ship, supposed to cruise in storms off the Cape of Good Hope. According to tradition, a Dutch captain, bound home from the Indies, met with long-continued head winds and heavy weather off this cape, and refused to put back, as he was advised to do, swearing a very profane oath that he would beat round the cape if he had to beat there till the Day of Judgment. He was taken at his word, and doomed to beat against winds all his days. His sails are believed to have become threadbare, and his ship's sides white with age, and himself and crew reduced almost to shadows. He cannot heave to nor lower a boat, but sometimes hails vessels through his trumpet, and requests them to take letters home for him. The superstition had its origin, probably, in the looming or apparent suspension in air of some ships out of sight—a phenomenon sometimes witnessed at sea, and caused by unequal refraction in the lower strata of the atmosphere.

Age of Animals.—The exact age attained by animals other than those domesticated it is, of course, impossible to ascertain.

It is believed, however, among East Indians, that the elephant lives about 300 years, and instances are on record of the animals having been kept in captivity as long as 130 years, their ages being unknown when they were first taken from the forest. Camels live from 40 to 50 years; horses average from 20 to 30, oxen about 20, sheep 8 or 9, and dogs from 12 to 14 years. The age of a whale is ascertained by the size and number of the laminae of certain organs in the mouth, formed of a horny substance commonly called whalebone. These laminae increase yearly, and, if the mode of computation be correct, it is known that whales have attained to the age of 400 years. Some species of birds attain a great age. The swan has been known to live 100 years, and it is recorded that the raven has exceeded that age. Parrots have been known to live 80 years. Pheasants and domestic poultry rarely exceed 12 or 15 years. Among fishes and animals that live in the water great age is often attained. The carp has been known to live 200 years. Common river trout have been confined in a well 30 and even 50 years, and a pike was caught in 1497 in a lake near Heilbronn, in Swabia, with a brass ring attached to it recording that it was placed in the lake in the year 1230.

New York Elevated Railways.—In 1868 an elevated railroad extending a half-mile was constructed on Greenwich street, New York, as an experiment. Three years later the West Side Elevated Railroad Company obtained a charter, but shortly afterward sold its right to the New York Elevated Railroad Company. The new organization proceeded rapidly to erect its roads, and in December, 1879, its rolling stock consisted of 131 locomotives, 292 passenger cars, and 8 service cars. In May, 1879, the road was leased to the Manhattan Railway Company. The Metropolitan Elevated Railroad was first called the Gilbert Elevated Railroad, in honor of its projector, Dr. Rufus H. Gilbert. Although the company obtained its charter in 1872, work was not commenced until March, 1876. In two years it expended \$10,300,000 in constructing its lines. In 1879 the road with its rolling stock, consisted of 56 locomotives, 180 passenger cars, and 2 freight cars, was leased to the Manhattan Elevated Railroad Company, which now controls and manages the entire elevated railroad system of New York.

The Famous Connecticut Blue Laws.—These laws, enacted by the people of the "Dominion of New Haven," became known as the blue laws because they were printed on blue paper. They were as follows:—

The governor and magistrates convened in general assembly are the supreme power, under God, of the independent dominion. From the determination of the assembly no appeal shall be made.

No one shall be a freeman or have a vote unless he is converted and a member of one of the churches allowed in the dominion.

Each freeman shall swear by the blessed God to bear true allegiance to this dominion and that Jesus is the only king.

No dissenter from the essential worship of this dominion shall be allowed to give a vote for electing of magistrates or any officer.

No food or lodging shall be offered to a heretic.

No one shall cross a river on the Sabbath but authorized clergymen.

No one shall travel, cook victuals, make beds, sweep houses, cut hair, or shave on the Sabbath Day.

No one shall kiss his or her children on the Sabbath or feasting days.

The Sabbath Day shall begin at sunset Saturday.

Whoever wears clothes trimmed with gold, silver, or bone lace above one shilling per yard shall be presented by the grand jurors and the selectmen shall tax the estate £300.

Whoever brings cards or dice into the dominion shall pay a fine of £5.

No one shall eat mince pies, dance, play cards, or play any instrument of music except the drum, trumpet, or jewsharp.

No gospel minister shall join people in marriage. The magistrate may join them, as he may do it with less scandal to Christ's church.

When parents refuse their children convenient marriages, the magistrate shall determine the point.

A man who strikes his wife shall be fined £10.

A woman who strikes her husband shall be punished as the law directs.

No man shall court a maid in person or by letter without obtaining the consent of her parents; £5 penalty for the first offense; £10 for the second, and for the third imprisonment during the pleasure of the court.

Perpetual Motion.—Perpetual motion is a movement which is not only self-active but also self-creative. A machine which when set in motion would continue to move without the aid of external force and without the loss of momentum until its parts were all worn out, might be said to have solved the perpetual motion problem. But even more is expected of this invention should it ever become practicable, that it shall go on doing work without drawing on any external source of energy, or shall by its movement continually create power. The impossibility of constructing such a machine has long been demonstrated, but still ignorant and ambitious inventors continue to try for it. As early as the year 1775, the Parisian Academy of Sciences refused to receive any further schemes for perpetual motion, regarding it as an impossibility. There was a time when the perpetual motion problem was worthy the attention of a philosopher, just as there was a time when a man might have been justified in doubting whether the earth was a globe.

Grangers, or Patrons of Husbandry, as they are properly called, were organized December 4, 1867, by Mr. O. H. Kelley and Mr. William M. Saunders, both of the Department of Agriculture at Washington. Mr. Kelley was commissioned by President Johnson, in 1866, to travel through the Southern States, and report upon their agricultural and mineral resources. He discovered agriculture in a state of great depression, consequent upon the changes made by the Civil War. There was also at the time serious dissatisfaction among the farmers of the West and Northwest in regard to the alleged heavy rate and unjust discriminations made by railroad companies in their transportation of farmers' products. It

was also claimed that middle men exacted exorbitant prices for agricultural implements, etc. Mr. Kelley concluded that an association made up of those who were dissatisfied might be organized on some such plan as the Order of Odd Fellows or Masons. He and Mr. Saunders devised a plan for an organization to be known as the "Patrons of Husbandry," and its branches to be called "Granges," and on December 4, 1867, the National Grange was organized at Washington. In the spring of 1868 granges were founded at Harrisburg, Pa.; at Fredonia, N. Y.; at Columbus, Ohio; at Chicago, Ill., and six in Minnesota. The movement became very popular, and they were, in a few years, organized in nearly every state and territory in the Union. The order has its greatest strength, however, in the Northwest and Western States.

Facts Worth Knowing.—Proper ages of reproduction 1, length of power of reproduction 2, and periods of gestation 3, in domestic animals:—

Field of the Cloth of Gold was so called from the extravagance and display attendant upon a meeting of Henry VIII. of

England and Francis I. of France, in June, 1530. The kings met in the field near the small town of Ardres, in France, which was owned by England, and the meeting was held by the request of Francis I., who desired to gain the friendship of Henry to aid him in his projects for curbing the power of his great rival, Charles V., of Germany. The ceremonial was under the direction of Cardinal Wolsey, and the nobility of France and England vied with each other in the gorgeous decoration of themselves, their banners and tents, and their retinues of followers.

Historic Minor Political Parties.—

Among the minor political parties which have appeared and disappeared during our national life are the following: *Anti-Renters*, a New York party which flourished about 1841. They resisted the collection of back rents on the Van Rensselaer manor near Albany. They had strength enough to defeat Wright, the regular Democratic candidate for governor of New York. *Barn-burners*, New York, 1846, seceders from the Democratic party. They were opposed to slavery extension. *Bucktails*, New York, about 1815; they supported Madison. *Conservatives*, New York and some other states, 1837; paper money Democrats. *Doughfaces*, 1820, Northern members of Congress, who voted in favor of the Missouri compromise. *Hunkers*, New York, a faction of the Democrats favoring the South, the Barn-burners being the other factor. *Know-Nothings*, New York, 1854, opposed to naturalization of foreigners unless they had been twenty-one years in the country. *Loco-Focos*, New York, 1835; a branch of the Democratic party. *Liberal Republicans*, 1872; Republicans who joined with the Democrats in support of Greeley for president. *Temperance*, or Prohibition, from 1830 down, in many states; in favor of preventing or restricting the sale of liquors. See tables of "Presidential Elections" for names of minor political parties which have figured in national elections.

Holy Roman Empire.—The name now given to the Empire erected by Charles the Great, in Western Europe, usually dated from his coronation at Rome by Pope Leo III. in 800. In theory the Holy Roman Empire was a continuation of the Western Empire which was overthrown by the barbarians in 476. When Charles the Great was crowned he thought of himself as the successor of the great Roman Emperors, Augustus, Trajan and Marcus Aurelius, and styled Augustus. This theory prevailed throughout the Middle Ages. Beginning with Otho, in 962, the King of Germany was usually Emperor. Frederick Barbarossa was the first to use the word holy as a part of the

title, partly to assert independence of the Pope and partly to indicate protection to the Church. After the fall of the Hohenstaufen dynasty in 1254 the Empire sank in importance and owed its real authority to the strength of the ruler who was Emperor. In the 18th century Voltaire said of the Holy Roman Empire that it was neither holy, nor Roman, nor an Empire. However, in its earlier existence it was a very important influence in the history of Europe. The Empire came to an end in 1806, when Francis II. resigned the imperial crown.

Relative Value of Different Foods for Stock.—One hundred pounds of good hay for stock are equal to:—

Acetylene.—A substance composed of carbon and hydrogen and of remarkable powers. It is produced in large quantities from carbide of calcium, a product of the electric furnace. When water is thrown on this substance it gives off acetylene gas. It was found about 1895, that this gas, when burned in a suitable burner, would give the brightest light of any known gas. When placed under strong pressure acetylene becomes a liquid.

About Ships.—**SPEED AND DISTANCE.**—The rapidity with which a rapid sailing

propelling steamer travels is ascertained by the number of revolutions or movements made per minute in certain portions of the machinery. It is also learned by the dropping of an object attached to a line into the water at the side of the stern of the vessel, which, remaining nearly stationary, allows the operator to know the speed by the number of knots which the line runs out in a certain number of seconds. The drop line, called the log line, contains a small string tied into a knot at a distance of every 47 feet and 3 inches; hence the name "knot."

STEAMSHIP NAMES.—The bow is the extreme forward part of the ship. The stern is the after part. Forward is the forepart of the vessel. Aft is the rear part. Amidships is the central part of the vessel. Starboard is the right side of the ship, looking forward. Port, the left side. The Index Guide gives the following description of sails, namely: The masts are the fore mast, main mast, and mizzen mast. The parts of the masts are the fore mast, fore-top mast, fore-topgallant mast, fore-royal mast, and similarly for the other masts; thus, main mast, main-top mast, mizzen-top mast, etc. Booms are round, heavy wooden spars to which the sails are attached—the jib-boom extending from the bowsprit, the flying jib-boom being attached to, but extending beyond, the jib-boom. The main and mizzen booms are attached to the main and mizzen masts, the spanker boom extends aft from the mizzen mast. Yards are strong, horizontal, wooden spars, extending crosswise the ship, to which the sails are attached along up the masts. The principal sails are the jib and flying jib, long triangular sails extending from the fore-mast to the jib-booms, and along the masts upward from the deck to the try-sail, the fore-course or fore-sail, or fore-top sail, fore-topgallant sail, fore-royal sail, fore-sky sail, and similarly for each of the other masts; thus, main try-sail, main sail, main top-sail, mizzen top-sail, etc., and spanker, the sternmost sail, extending from the spanker boom to the gaff. The ensign or ship's colors are attached to the gaff. Shrouds are the ropes used to sustain the masts and extend from the fore-top to the sides of the ship (the rope ladders). The other ropes used as supports to the masts are designated stays, and are named from that part of the mast to which they are attached, as fore-stay, mizzen-stay, fore royal-stay, mizzen-topgallant-stay, etc. The jib-boom, flying jib-boom, and several of the sails here mentioned, are not required and are not used on the large modern steamers.

Hero and Leander.—Hero was a priestess of Venus. Leander was a youth of Abydos, a famous city on the Asiatic side of the strait

of the Hellespont, nearly opposite the city Sestos, on the European coast. At a festival of Venus and Adonis, held at Sestos, Hero and Leander first saw each other, and were immediately inspired with a mutual passion; but Hero's office as a priestess and the opposition of her parents stood in the way of their union. Undaunted by these obstacles, Leander every night swam across the Hellespont to visit his beloved, who directed his course by holding a burning torch from the top of a tower on the seashore. After many meetings Leander was drowned on a tempestuous night, and his body was cast up at the foot of the tower where Hero stood expecting him. Heartbroken at the sight, she flung herself from the tower into the sea, and passed with her lover into the immortality of art and song.

Popular Names of Cities.—The nicknames given to the various prominent cities in the United States are as follows: Brooklyn, N. Y., City of Churches; Boston, Hub of the Universe; Baltimore, Monumental City; Buffalo, Queen City of the Lakes; Chicago, Garden City; Cincinnati, Queen City; Cleveland, Forest City; Detroit, City of the Straits; Hannibal, Bluff City; Indianapolis, Railroad City; Keokuk, Gate City; Louisville, Falls City; Lowell, City of Spindles; New York, Gotham, Empire City; New Orleans, Crescent City; Nashville, City of Rocks; New Haven, City of Elms; Philadelphia, Quaker City, City of Brotherly Love; Pittsburg, Iron City; Portland, Me., Forest City; Rochester, Flour City; St. Louis, Mound City; Springfield, Ill., Flower City; Washington, D. C., City of Magnificent Distances.

Principal Exports of Various Countries.—ARABIA.—Coffee, aloes, myrrh, frankincense, gum arabic.

BELGIUM.—Grain, flax, hops, woolens, linens, laces, various manufactures.

BRAZIL.—Cotton, sugar, coffee, tobacco, gold, diamonds, wheat, and dye-goods.

CANADA, NOVA SCOTIA, AND NEW BRUNSWICK.—Flour, furs, lumber, fish.

CAPE COLONY.—Brandy, wine, ostrich feathers, hides, tallow.

CENTRAL AMERICA.—Logwood, mahogany, indigo, cocoa.

CHILE.—Silver, gold, copper, wheat, hemp, hides, sugar, cotton, fruits.

CHINA.—Tea, silks, nankeens, porcelain, opium, articles of ivory and pearl.

DENMARK.—Grain, horses, cattle, beef, pork, butter, cheese.

EASTERN, WESTERN, AND SOUTHERN AFRICA.—Gold, ivory, ostrich feathers.

EGYPT.—Rice, grain, linseed, fruits, indigo, cotton, sugar.

ECUADOR AND COLOMBIA.—Coffee, cotton, indigo, cocoa, fruits, sugar.

FRANCE.—Silks, woolens, linens, cotton, wine, brandy, porcelain, toys.

GERMANY.—Linen, grain, various manufactures of silver, copper, etc.

GREAT BRITAIN.—Woolens, cottons, linens, hardware, porcelain, etc.

GREENLAND.—Whale oil, whalebone, seal skins.

HINDOOSTAN.—Cotton, silks, rice, sugar, coffee, opium, indigo.

HOLLAND.—Fine linens, woolens, butter, cheese, various manufactures.

ITALY.—Silks, wine, oil, grain, fruits.

IRELAND.—Linens, beef, butter, tallow, hides, potatoes, barley.

JAPAN.—Silk and cotton goods, japanware, porcelain.

MEXICO.—Gold, silver, logwood, cochineal, fruits.

PERSIA.—Carpets, shawls, wine, silk, cotton, rice, rhubarb, guns, swords, etc.

PERU.—Silver, gold, Peruvian bark, mercury, sugar, cotton, fruits.

RUSSIA.—Hemp, iron, linen, grain, timber, furs, tallow, platina.

SPAIN AND PORTUGAL.—Silks, wool, wine, oil, fruits, salt.

SWEDEN AND NORWAY.—Iron, steel, copper, timber, fish.

SWITZERLAND.—Watches, jewelry, paper, laces, linen, cotton, and silk goods, etc.

TURKEY.—Grain, fruits, cotton, oil, wines, carpets, muslin, swords.

UNITED STATES:—

EASTERN STATES.—Lumber, beef, pork, fish, cottons, woolens, etc.

MIDDLE STATES.—Flour, wheat, salt, coal, cottons, woolens.

SOUTHERN STATES.—Cotton, rice, tobacco, corn, lumber, pitch, fruits.

WESTERN STATES.—Corn, wheat, lead, coal, iron, salt, lime, beef, pork.

VENEZUELA.—Sugar, coffee, cocoa, cotton, indigo, fruits.

WEST INDIES.—Sugar, rum, molasses, coffee, spice, cotton, indigo, fruits.

What Dynamite is and How it is Made.—Few people know what dynamite is, though the word is in common use. It is a giant gunpowder; that is, an explosive material, varying in strength and safety of handling according to the percentage of nitro-glycerine it contains. Nitro-glycerine, whence it derives its strength, is composed of ordinary glycerine and nitric acid, compounded together in certain proportions and at a certain temperature. Nitro-glycerine, though not the strongest explosive known, being exceeded in power

by nitrogen and other products of chemistry, is thus far the most terrible explosive manufactured to any extent. Nitro-glycerine by itself is not safe to handle, hence dynamite is preferred. It is extensively made and consumed in the United States under the various names of Giant, Hercules, Jupiter, and Atlas powders, all of which contain anywhere from thirty to eighty per cent. of nitro-glycerine, the residue of the compound being made up of rotten stone, non-explosive earth, sawdust, charcoal, plaster of paris, black powder, or some other substance that takes up the glycerine and makes a porous, spongy mass.

Nitro-glycerine was discovered by Salvero, an Italian chemist, in 1845. Dynamite is prepared by simply kneading with the naked hands twenty-five per cent. of infusorial earth and seventy-five per cent. of nitro-glycerine until the mixture assumes a putty condition, not unlike moist brown sugar. Before mixing, the infusorial earth is calcined in a furnace, in order to burn out all organic matter, and it is also sifted to free it of large grains. While still moist it is squeezed into cartridges, which are prepared of parchment paper, and the firing is done by fulminate of silver in copper capsules provided with patent exploders.

Nitro-glycerine is made of nitric acid one part and sulphuric acid two parts, to which is added ordinary glycerine, and the mixture is well washed with pure water. The infusion is composed of small microscopic silicious shells which have lost their living creatures. The cellular parts receive the nitro-glycerine and hold it by capillary attraction, both inside and out. The earth is very light. Water is expelled from it by means of a furnace, and then, in the form of a powder, it is mixed with nitro-glycerine. Nitro-glycerine has a sweet, aromatic, pungent taste, and the peculiar property of causing a violent headache when placed in a small quantity on the tongue or wrist. It freezes at 40 degrees Fahrenheit, becoming a white, half crystallized mass, which must be melted by the application of water at a temperature about 100 degrees Fahrenheit.

Confederate Soldiers Surrendered at end of War.—Army of Northern Virginia, 27,805; army of Tennessee, 81,243; army of Missouri, 7,978; army of Alabama, 42,293; army of Trans-Mississippi, 17,686; at Nashville and Chattanooga, 5,029; paroled in Departments of Virginia, Cumberland, Maryland, Alabama, Florida, Tennessee, Texas, etc., 42,189; Confederate prisoners in Northern prisons at the close of the war, 98,802; total Confederate army at close, 278,025. A large and unknown number of Confederate soldiers were not present at surrender.

Costly Mansion.—The largest and costliest private mansion in the world is that belonging to Lord Bute, called Montstuart, and situated near Rothesay, England. It covers nearly two acres; is built in Gothic style; the walls, turrets, and balconies are built of stone. The immense tower in the center of the building is 120 feet high, with a balcony around the top. The halls are constructed entirely of marble and alabaster, and the rooms are finished in mahogany, rosewood, and walnut. The fireplaces are all carved marbles of antique designs. The exact cost of this fairy palace is not known, but it has never been estimated at less than \$8,000,000.

Age and Growth of Trees.—An oak tree in three years grows 2 feet 10½ inches. A larch 3 feet 7½ inches; at seventy years it is full grown, and a tree of seventy-nine years was 102 feet high and 12 feet girth, containing 253 cubic feet. Another of eighty years was 90 feet and 17 feet, and 300 cubic feet. An elm tree in three years grows 8 feet 3 inches. A beech, 1 foot 8 inches. A poplar, 6 feet. A willow, 9 feet 3 inches. An elm is fully grown in 150 years, and it lives 500 or 600. Ash is full grown in 100, and oak in 200. The mahogany is full grown in 200 years to a vast size. A Polish oak 40 feet round had 600 circles. An oak in Dorsetshire in 1755 was 68 feet round, two near Cranborne Lodge are 38 feet and 36 feet. There are yews from 10 to 20 feet in diameter, whose age is from 1,000 to 2,000 years. A lime in the Grisons is 51 feet round and about 600 years old. An elm in the Pays de Vaud is 18 feet in diameter and 360 years old. The African baobab is the patriarch of living organizations; one specimen, by its circles, is estimated at 5,700 years old by Adamson and Humboldt. The trunk is but 12 or 15 feet to the branches, and often 75 feet round. A cypress in Mexico is 120 feet round, and is estimated by De Candolle to be older than Adamson's baobab. The cypress of Montezuma is 41 feet round. Strabo wrote of a cypress in Persia as being 2,500 years old. The largest tree in Mexico is 127 feet round and 120 high, with branches of 30 feet. A chestnut tree on Mount Etna is 106 feet round close to the ground, and five of its branches resemble great trees. De Candolle says there are oaks in France 1,500 years old. The Wallace oak near Paisley is nearly 800 years old. The yew trees at Fountain's Abbey are about 1,200 years old. That at Crowhurst 1,500. That at Fortingal, above 2,000. That at Braburn, 2,500 to 3,000. Ivies reach 500 or 600 years. The larch the same. The lime 600 or 700 years. The trunk of a walnut tree 12 feet in diameter, hollowed out, and furnished

as a sitting room, was imported from America and exhibited in London. The trunk was 80 feet high without a branch, and the entire height 150 feet, the bark 12 inches thick, and the branches from 3 to 4 feet in diameter. The California pine is from 150 to 200 feet high, and from 20 to 60 feet in diameter. The forests in watered, tropical countries are formed of trees from 100 to 200 feet high, which grow to the water's edge of rivers, presenting a solid and impenetrable barrier of trunks 10 or 12 feet in diameter. The dragon tree is in girth from 40 to 100 feet, and 50 or 60 feet high, and a mimosa in South America is described whose head is 600 feet round.

Mount Etna and its Eruptions.—Mount Etna is a volcano of Sicily, and has been active from the earliest times. The ancients had a fable that beneath the mountain was buried a mighty giant, Enceladus, whom Jove had hurled from heaven for rebellion, and pinned to earth by tossing a mountain upon him. The flames were the breath of the imprisoned monster, the loud noises his groans, and earthquakes were caused by his efforts to turn over his enormous body. The first recorded eruption of Etna occurred before the supposed date of the Trojan war, but its exact time is not known. Thucydides, the historian, next records three eruptions—one in the year 475 B. C., one in 425, and the third at an earlier date not specified. Since those there have been, down to the present time, seventy-eight outbreaks, many of them harmless. Among the most remarkable of the great eruptions were that of 1169 A. D., when Catania and 15,000 of its inhabitants were destroyed; that of 1527, in which two villages were destroyed and many human beings perished; and two eruptions of 1669, in which 15 villages were destroyed. Many fissures in the earth were made at this time—one twelve miles long, which emitted a most vivid light. Afterward five other fissures opened, from which came smoke and loud noises. The city of Catania, at the foot of the mountain, had built a wall sixty feet high on that side to protect it, but the lava rose until it overflowed the wall and poured a current of liquid fire into the houses. This current flowed onward until it reached the sea, 15 miles distant. It was 600 yards wide and 40 feet deep. Entering the sea, the water was thrown into violent commotion, the noise of its agitation was as loud as thunder, and clouds of steam darkened the air for many hours. The eruption of 1755 was remarkable for an inundation caused by the flow of the hot lava over the snow that covered the mountain. It was imagined at the time that the water was thrown out of the

crater. A great eruption took place in 1852, immense clouds of ashes being ejected. From two new openings on the east vast torrents of lava poured out, one of which was two miles broad, and in part of its course 170 feet deep. The outbreak of May, 1879, was violent, the clouds of smoke and showers of ashes being followed by the ejection of a stream of lava 200 feet wide, which desolated large tracts of cultivated land. There were also eruptions in 1883 and 1886, but both subsided before any great damage had been caused. Mount Etna is now 10,868 feet high. It is known that frequent eruptions have broken off large parts of the upper portion of the mountain. Its surface is divided into three distinct regions. The lowest is that of fertile land, producing fruit and grain, which extends 2,000 feet from the base up the mountain side, with a circumference of 92 miles. Above this is a strip nearly 4,300 feet wide, covered with large forests, above which to the mountain top there is only a dreary waste of ashes and hardened lava. In spite of its tragic history, the sides of the mountain have a population of over 300,000 people in 63 small villages and 2 large cities.

Postage Stamps, Language of.—Of late years the postage stamp has been invested with a language of its own. When a stamp is inverted on the right-hand upper corner, it means the person written to is to write no more. If the stamp be placed on the left-hand upper corner, inverted, then the writer declares his affection for the receiver of the letter. When the stamp is in the center at the top it signifies an affirmative answer to a question or the questions, as the case may be; and when it is at the bottom, it is a negative. Should the stamp be on the right-hand corner, at a right angle, it asks the question if the receiver of the letter loves the sender; while in the left-hand corner means that the writer hates the other. There is a shade of difference between desiring one's acquaintance and friendship. For example: the stamp at the upper corner at the right expresses the former, and on the lower left-hand corner means the latter. The stamp on a line with the surname is an offer of love; in the same place, only reversed, signifies that the writer is engaged. To say farewell, the stamp is placed straight up and down in the left-hand corner.

Fabian Policy.—The policy of wearing out the enemy in war by delays, misleading movements, feints of attack, etc., while avoiding open battle, is called the "Fabian policy" from the following circumstance: Fabius Maximus was a Roman General in the second Punic War. Having been appointed just after

the Roman army had suffered severe defeat at Lake Thrasymene, he perceived that his disheartened troops and bands of raw recruits could not oppose successfully a trained army flushed with victory and led by their great commander Hannibal. He therefore avoided pitched battles, moved his camp from highland to highland, and tired out the enemy with marches and counter-marches. This he continued until thwarted in his calculations by the impatience of the Roman Senate.

Character by the Month.—Here is an old astrological prediction, said to indicate, with tolerable certainty, the character of the girl according to the month she happens to be born in.

If a girl is born in January, she will be a prudent housewife, given to melancholy, but good-tempered.

If in February, a humane and affectionate wife and tender mother.

If in March, a frivolous chatterbox, somewhat given to quarreling.

If in April, inconstant, not intelligent, but likely to be good-looking.

If in May, handsome and likely to be happy.

If in June, impetuous, will marry early, and be frivolous.

If in July, passably handsome, but with a sulky temper.

If in August, amiable and practical, and likely to marry rich.

If in September, discreet, affable, and much liked.

If in October, pretty and coquettish, and likely to be unhappy.

If in November, liberal, kind, of a mild disposition.

If in December, well proportioned, fond of novelty, and extravagant.

The World's Principal Tin Mines.

—Pure tin is an elementary metal, as much so as lead, iron, silver, or gold. The principal tin-producing country is England. The Phœnicians traded with England for tin 1,100 years before the Christian era. There is reason to believe that they got tin from Spain also; but England was depended on for nearly all the tin used in Europe until this ore was discovered in Germany in 1240. It was discovered in Northern Africa in the Barbary States in 1640, in India in 1740, in New Spain in 1782. Tin was mined in Mexico before the Spanish conquest, and used in T shaped pieces for money, and in a bronze composition for sharp tools, the principal mines being at Tasco. Peru has valuable mines of this metal, so have New South Wales, Australia, and Banca, and Malacca in the Malay peninsula. Tin has been discovered in Pennsylvania, Missouri, Califor-

nia, Dakota, and other states of the Union, but not in quantities to tempt capital to engage in mining it, with the exception of Dakota, where the Illinois Steel Mill Company has large interests. The chief tin-producing countries are the following, arranged in the order of importance: England, about 10,000 tons a year; Malacca, about 8,500 tons; Australia, about 6,000 tons; Banca, about 4,000 tons; and Billiton, about 3,000 tons. Both of these last named places are islands of the Dutch East Indies.

St. Valentine's Day.—The custom of sending valentines can, without doubt, be traced, in origin, to a practice among the ancient Romans. At the feast of the Lupercalia, which was held on the 15th of February, in honor of the great god Pan, the names of all the virgin daughters of Rome were put in a box and drawn therefrom by the young men, and each youth was bound to offer a gift to the maiden who fell to his lot, and to make her his partner during the time of the feast. This custom became allied to the name of St. Valentine, probably, only through a coincidence in dates. St. Valentine was a bishop of Rome during the third century. He was of most amiable nature, and possessed remarkable gifts of eloquence, and was so very successful in converting the pagan Romans to Christianity that he incurred the displeasure of the Emperor, and was martyred by his order February 14, A. D. 270. When the saint came to be placed in the calendar, his name was given to the day of his death, and this was made a festival, to offset that of the Lupercalia, and an effort was made to substitute the names of saints for those of girls in the lottery, but naturally without success. Many other customs of mediæval and later times, which have become allied in name to a holy saint of the church, are unquestionably of purely secular, even pagan, origin.

Royal Household.—In all mediæval monarchies of western Europe the general system of government sprang from, and centered in, the royal household. The sovereign's domestics were his officers of state, and the leading dignitaries of the palace were the principal administrators of the kingdom. The royal household itself had, in its turn, grown out of an earlier and more primitive institution. It took its rise in the *comitatus*, described by Tacitus, the chosen band of *comites* or companions who, when the Roman historian wrote, constituted the personal following, in peace as well as in war, of the Teutonic *princeps* or chieftain. In England before the conquest the *comites* were called thegns. After the conquest the most powerful of the king's thegns became officers of the royal household by heredity.

The Stage.

BIRTHPLACES AND BIRTH YEARS OF DRAMATIC AND MUSICAL PEOPLE.

| NAME. | BIRTHPLACE. | Born. | NAME. | BIRTHPLACE. | Born. |
|-------------------------|----------------------|-------|-----------------------|---------------------------|-------|
| Adams, Maude | Salt Lake City, Utah | 1873 | Holland, E. M. | New York city | 1848 |
| Albani, Emma | Chambly, Canada | 1851 | Hopper, De Wolf | New York city | 1853 |

Vaudeville.—The name Vaudeville is a corruption of Vaux de Vire, the name of two picturesque valleys in the Bocage of Normandy, and was originally applied to a song with words relating to some story of the day. These songs were first composed by one Oliver Basselin, a fuller in Vire; they were very popular, and spread all over France, and were called by the name of their native place (Les Vaux de Vire). As the origin of the term was soon lost sight of, it at last took its present form. The word is now used to signify a play in which dialogue is interspersed with songs incidentally introduced, but forming an important part of the drama.

The Single Tax.—This idea was first formulated by Mr. Henry George, in his book, "Progress and Poverty," in 1879, and has grown steadily in favor. Single tax men assert, as a fundamental principle, that all men are equally entitled to the use of the earth; therefore, no one should be allowed to hold valuable land without paying to the community the value of the privilege. They hold that this is the only rightful source of public revenue, and they would, therefore, abolish all taxation, local, state, and national, except a tax upon the rental value of land, exclusive of its improvements, the revenue thus raised to be divided among local, state, and general governments, as the revenue from certain direct taxes is now divided between local and state governments.

The single tax would not fall on all land, but only on valuable land, and on that in proportion to its value. It would thus be a tax, not on use or improvements, but on ownership of land, taking what would otherwise go to the landlord as owner.

In accordance with the principle that all men are equally entitled to the use of the earth, they would solve the transportation problem by public ownership, and control of all highways, including the roadbeds of railroads, leaving their use equally free to all.

The single tax system would:—

1. Dispense with a horde of taxgatherers, simplify government, and greatly reduce its cost.

2. Give us with all the world that absolute free trade which now exists between the states of the Union.

3. Give us free trade in finance by abolishing all taxes on private issues of money.

4. Take the weight of taxation from agricultural districts, where land has little or no value apart from improvements, and put it upon valuable land, such as city lots and mineral deposits.

5. Call upon men to contribute for public expenses in proportion to the natural opportu-

nities they monopolize, and compel them to pay just as much for holding the land idle as for putting it to its fullest use.

6. Make it unprofitable for speculators to hold land unused or only partly used, and, by thus opening to labor unlimited fields of employment, solve the labor problem, raise wages in all occupations, and abolish involuntary poverty.

Printer's Devil.—The origin of this term is ascribed to the fact that in the early days of printing the apprentice's duties included the inking of the forms with bags containing ink or besmeared with it. In the performance of this work his face and hands became so daubed with the ink that in appearance he suggested the devil. Hence the name.

Bastille.—The famous French prison known by this name was originally the Castle of Paris, and was built by order of Charles V., between 1370 and 1383, as a defense against the English. When it came to be used as a state prison it was provided with vast bulwarks and ditches. The Bastille had four towers, of five stories each, on each of its larger sides, and it was partly in these towers and partly in underground cellars that the prisons were situated. It was capable of containing seventy to eighty prisoners, a number frequently reached during the reigns of Louis XIV. and Louis XV., the majority of them being persons of the higher ranks. The Bastille was destroyed by a mob on the 15th of July, 1789, and the governor and a number of his officers were killed. On its site now stands the Column of July, erected in memory of the patriots of 1789 and 1830.

White House Weddings.—The first wedding to occur in the White House was that of Miss Todd, a relative by marriage of President Madison. Then, in their order, came the weddings of Elizabeth Tyler, a daughter of President Tyler; John Quincy Adams, Jr.; Miss Easton and Miss Lewis, both during General Jackson's administration; Martha Monroe; Nellie Grant; Emily Platt, a niece of President Hayes; President Cleveland, and Miss Alice Roosevelt.

Dying Sayings of Famous People.

Addison. "See how a Christian dies!" or "See in what peace a Christian can die!"

Anaxagoras. "Give the boys a holiday."

Arris. "My Petus, it is not painful."

Augustus. "Vos Plaudite." (After asking how he had acted his part in life.)

Beaufort (Cardinal Henry). "I pray you all, pray for me."

Berry (Mme. de). "Is not this dying with courage and true greatness?"

Bronte (father of the authoress). "While there is life there is will." (He died standing.)

Byron. "I must sleep now."

Cæsar (Julius). "Et tu, Brute!" (To Brutus, when he stabbed him.)

Charlemagne. "Lord, into Thy hands I commend my spirit!"

Charles I. (of England). "Remember." (To William Juxon, Archbishop of Canterbury.)

Charles II. (of England). "Don't let poor Nelly starve." (Nell Gwynne.)

Charles V. "Ah, Jesus!"

Charles IX. (of France). "Nurse, nurse, what murder! what blood! Oh, I have done wrong. God pardon me."

Charlotte (the princess). "You make me drink. Pray, leave me quiet. I find it affects my head."

Chesterfield. "Give Day Rolles a chair."

Columbus. "Lord, into Thy hands I commend my spirit!"

Crome (John). "Oh, Hobbima, Hobbima, how I do love thee!"

Cromwell. "My desire is to make what haste I may to be gone."

Demonax (the philosopher). "You may go home, the show is over."—*Lucian.*

Elden (Lord). "It matters not, where I am going, whether the weather be cold or hot."

Fontenelle. "I suffer nothing, but feel a sort of difficulty in living longer."

Franklin. "A dying man can do nothing easy."

Gainsborough. "We are all going to heaven, and Vandyke is of the company."

George IV. "Whattit, what is this? It is death, my boy. They have deceived me." (Said to his page, Sir Walther Waller.)

Gibbon. "Mon Dieu! Mon Dieu!"

Goethe. "More light!"

Gregory VII. "I have loved justice and hated iniquity, therefore I die in exile."

Grey (Lady Jane). "Lord, into Thy hands I commend my spirit!"

Grotius. "Be serious."

Haydn. "God preserve the emperor."

Haller. "The artery ceases to beat."

Hazlitt. "I have led a happy life."

Hobbes. "Now I am about to take my last voyage—a great leap in the dark."

Hunter (Dr. William). "If I had strength to hold a pen, I would write down how easy and pleasant a thing it is to die."

Irving. "If I die I die unto the Lord. Amen."

James V. (of Scotland). "It came with a lass and will go with a lass" (i. e., the Scotch crown).

Jefferson (of America). "I resign my spirit to God, my daughter to my country."

Jesus Christ. "It is finished."

Johnson (Dr.). "God bless you, my dear!" (To Miss Morris.)

Knox. "Now it is come."

Louis I. "Huz! huz!" (Bouquet says, "He turned his face to the wall, and twice cried 'huz! huz!' (out, out) and then died.")

Louis IX. "I will enter now into the house of the Lord."

Louis XIV. "Why weep ye? Did you think I should live forever?" Then, after a pause, "I thought dying had been harder."

Louis XVIII. "A king should die standing."

Mahomet. "Oh, Allah, be it so! Henceforth among the glorious host of paradise."

Marie Antoinette. "Farewell, my children, forever. I go to your father."

Mirabeau. "Let me die to the sounds of delicious music."

Moody (the actor).

Reason thus with life,
If I do lose thee, I do lose a thing
That none but fools would keep.—*Shakespeare.*

Moore (Sir John). "I hope my country will do me justice."

Napoleon III. "Were you at Sedan?" (To Dr. Conneau.)

Nelson. "I thank God I have done my duty."

Pitt (William). "Oh, my country, how I love thee!"

Pizarro. "Jesu!"

Pope. "Friendship itself is but a part of virtue."

Rabelais. "Let down the curtain, the farce is over."

Sand (George). "Laissez la verdure." (Leave the tomb green.)

Schiller. "Many things are growing plain and clear to my understanding."

Scott (Sir Walter). "God bless you all." (To his family.)

Socrates. "Crito, we owe a cock to Esculapius."

Stael (Mme. de). "I have loved God, my father, and liberty."

Thurlow (Lord). "I'll be shot if I don't believe I'm dying."

William III. (of England). "Can this last long?" (To his physician.)

Wolfe (General). "What! do they run already? Then I die happy."

State Flowers.—The following are "State Flowers" as adopted in most instances by the votes of the public school scholars of the respective states:—

| | |
|-------------------------|--------------------------------|
| California..... | California Poppy |
| Colorado..... | Columbine |
| Delaware..... | Peach Blossom |
| Idaho..... | Syringa |
| Indiana..... | Orn |
| Iowa..... | Wild Rose |
| Maine..... | Fine Cone and Tassel |
| Michigan..... | Apple Blossom |
| Minnesota..... | Cypripedium or Moccasin Flower |
| Montana..... | Bitter Root |
| Nebraska..... | Golden-rod |
| Nevada..... | Sunflower |
| New York..... | Rose; State tree..... Maple |
| North Dakota..... | Golden-rod |
| Oklahoma Territory..... | Mistletoe |
| Oregon..... | Golden-rod |
| Rhode Island..... | Violet |
| Utah..... | Sage Lily |
| Vermont..... | Red Clover |
| Washington..... | Rhododendron |

* Adopted by State Legislature, not by public school scholars.

In other states the scholars or State Legislatures have not yet taken action. In Illinois in the vote on the leading State Flower by the pupils of the schools the Rose, Violet, and Golden-rod received the largest number of votes, in the order named, although no state flower was adopted. In Massachusetts the Columbine was strongly urged, but no flower was adopted. In Ohio and Tennessee the Golden-rod is advocated.

Absinthe is a spirit flavored with the pounded leaves and flowering tops of wormwood, together with angelica-root, sweet-flag root, star-anise, and other aromatics. The aromatics are macerated for about eight days in alcohol and then distilled, the result being an emerald-colored liquor. The best absinthe is made in Switzerland, the chief seat of the manufacture being in the canton of Neuchâtel. It is chiefly used in France and the United States. The evil effects of drinking this liquor are very apparent; frequent intoxication, or moderate but steady tipping, utterly deranges the digestive system, weakens the frame, induces horrible dreams and hallucinations, and may end in paralysis or in idiocy.

United States Navy Pay Table.

| RANK. | At Sea. | On Shore Duty. | On Leave or Waiting Orders. |
|---|----------------|----------------|-----------------------------|
| Admiral.....\$13,500—For life. | | | |
| Rear-Admirals..... | \$6,000 | \$5,000 | \$4,000 |
| Commodores..... | 5,000 | 4,000 | 3,000 |

| Surgeons, Paymasters, and Chief Engineers..... | 2,800 to 4,200 | 2,400 to 4,000 | 2,000 to 3,000 |
| Chaplains..... | 2,500 to 2,800 | 2,000 to 2,300 | 1,600 to 1,900 |

Warrant officers are paid from \$700 to \$1,800, and seamen, \$228 to \$288 per annum.

*After date of commission. †From date of commission.

United States Naval Enlistment.—

All applicants for enlistment in the naval service must be of robust frame, intelligent, of perfectly sound and healthy constitution and free from any of the following physical defects: Greatly retarded development, feeble constitution, inherited or acquired; permanently impaired general health, decided cachexia, diathesis or predisposition, weak or disordered intellect, epilepsy or other convulsions within five years, impaired vision or chronic disease of the organs of vision, great dullness of hearing or chronic disease of the ears, chronic nasal catarrh, ozena, polypi or great enlargement of the tonsils, marked impediment of speech, decided indications of liability to pulmonary disease, chronic cardiac affections, large vari-

cose veins of lower limbs, chronic ulcers, unnatural curvature of the spine, permanent disability of either of the extremities or articulations from any cause, defective teeth.

Following are the requirements for the various classes of the service, and monthly wages paid:—

| Class. | Age. | Wages. |
|-----------------------|----------|----------|
| Landmen..... | 18 to 25 | \$16 |
| Ordinary Seamen..... | 18 to 30 | 19 |
| Seamen..... | 21 to 35 | 24 |
| Painter..... | 21 to 35 | 30 |
| Bugler..... | 21 to 35 | 30 |
| Shipwright..... | 21 to 35 | 25 |
| Carpenter's mate..... | 21 to 35 | 40 to 50 |
| Chief yeoman..... | | 60 |
| Yeoman..... | | 30 to 40 |
| Musicians..... | 21 to 35 | 32 |
| Cooks..... | 21 to 35 | 40 |
| Mess attendants..... | 21 to 30 | 16 |
| Sailmakers..... | 21 to 35 | 25 |
| Machinist..... | | 40 to 70 |
| Boiler-maker..... | 21 to 35 | 60 |
| Blacksmith..... | 21 to 35 | 50 |
| Firemen..... | 21 to 35 | 30 to 35 |
| Coal passers..... | 21 to 35 | 22 |

Slavery and Serfdom.—Some of the wealthy Romans had as many as 10,000 slaves. The minimum price fixed by the law of Rome was \$80, but after great victories they could sometimes be bought for a few shillings on the field of battle. The day's wages of a Roman gardener were about sixteen cents, and his value about \$300, while a blacksmith was valued at about \$700, a cook at \$2,000, an actress at \$4,000, and a physician at \$11,000.

The number of slaves emancipated in the British Colonies in 1834 was 780,993, the indemnity aggregating, in round figures, \$100,000,000. In Brazil, in 1876, there were 1,510,800 slaves, 15 per cent. of the entire population. These were held by 41,000 owners, averaging 37 to each owner. In 1882 the number of slaves was 1,300,000. Owing to the gradual abolition of slavery in Brazil by law, it is expected that it will be entirely obsolete in 1900.

SLAVERY IN THE UNITED STATES.

| Year. | Number. | Year. | Number. |
|-----------|-----------|-----------|-----------|
| 1790..... | 697,900 | 1830..... | 2,009,030 |
| 1800..... | 893,040 | 1840..... | 2,487,500 |
| 1810..... | 1,191,400 | 1850..... | 3,204,300 |
| 1820..... | 1,538,100 | 1860..... | 3,979,700 |

Serfdom in Russia.—There were 47,932,000 serfs in Russia in 1861, as follows: Crown serfs, 22,851,000; appanage, 3,320,000; held by nobles, 21,755,000. The cost of redemption was, in round numbers, about \$325,000,000, as follows:—

| | | | |
|-------------------------|---------------|--------------------|--------------|
| Mortgages remitted..... | \$152,000,000 | Paid by serfs..... | \$53,000,000 |
| Gov't ment scrip..... | 101,000,000 | Balance due..... | 20,000,000 |

The indemnity to the nobles was \$15 per serf. The lands are mortgaged to the state till 1912. The lands ceded to crown serfs are mortgaged only till 1901. The item of "mort-

gages remitted" is the amount due by nobles to the Imperial Bank and canceled.

AUSTRIAN SERVITUDE (1840).

| | Value. |
|--------------------------------|---------------|
| Labor (two days per week)..... | \$175,000,000 |
| Tithe of crops, etc..... | 60,000,000 |
| Male tribute, timber..... | 7,000,000 |
| Female tribute, spun wool..... | 9,000,000 |
| Powl, eggs, butter..... | 5,000,000 |
| Total | \$256,000,000 |

There were 7,000,000 serfs, whose tribute averaged more than \$35 per head, which was, in fact, the rent of their farms. Some Bohemian nobles had as many as 10,000 serfs. The redemption was effected by giving the nobles 5 per cent. Government scrip, and land then rose 50 per cent. in value.

Rabbit's Foot.—The legends of "Br'er Rabbit," among the negroes, his clever devices in outwitting his natural enemies—the dog, fox, and wolf—and thwarting every scheme designed for his own punishment, are almost without number. From these legends of the preternatural sagacity of the living rabbit came the idea that the dead rabbit had certain magic

powers. The negroes believe that to carry a rabbit's foot in the pocket is not only a talisman for good luck, but is a specific for diseases. The left hind foot of the rabbit is believed to have the most efficacy, and if it be taken from a rabbit that runs in a graveyard, its supernatural properties are believed to be quite irresistible.

Acquisition of Territory.—The increase in area of the United States, by war and treaty, is shown in the annexed table:—

| When. | How. | Whence. | What. | Sq. Miles. |
|-------|---------|----------|--------------------------------------|------------|
| 1776 | War... | England. | { Thirteen origi- nal States a. } | 820,660 |
| 1783 | War... | France. | Louisiana b. | 899,579 |
| 1803 | Treaty. | Spain. | Florida c. | 66,900 |
| 1819 | Treaty. | Mexico. | Texas d. | 318,000 |
| 1845 | Treaty. | England. | Oregon | 308,062 |
| 1846 | War... | Mexico. | { California and New Mexico e } | 522,955 |
| 1848 | Treaty. | Mexico. | Gadsden Purchase f | 45,535 |
| 1867 | Treaty. | Russia. | Alaska g. | 580,107 |
| 1898 | Treaty. | Hawaii. | Hawaii | 6,740 |
| 1898 | War... | Spain. | Porto Rico | 3,600 |
| 1898 | War... | Spain. | Philippines | 130,000 |
| | | | | 3,692,148 |

a Estimated cost of War of Independence, \$168,000,000.
b Purchased for \$15,000,000. c Cost \$3,000,000.
d Debt of Texas on admission into the Union, \$7,500,000.

e Estimated cost of the Mexican War, \$15,000,000.
f Cost \$10,000,000. g Cost \$7,300,000.

The Capital of the United States has been located at different times at the following places: At Philadelphia from September 5, 1774, to December, 1776; at Baltimore from December 20, 1776, to March, 1777; at Philadelphia from March 4, 1777, to September, 1777; at Lancaster, Pa., from September 27, 1777, to September 30, 1777; at York, Pa., from September 30, 1777, to July, 1778; at Philadelphia from July 2, 1778, to June 30, 1783; at Princeton, N. J., June 30, 1783, to November 20, 1783; Annapolis, Md., November 26, 1783, to November 30, 1784; Trenton from November, 1784, to January, 1785; New York from January 11, 1785, to 1790; then the seat of government was re-

moved to Philadelphia, where it remained until 1800, since which time it has been in Washington.

Some Interesting Dates.—FRUITS, FLOWERS, ETC.—The cherry dates back to A. D. 100; the lily, 800; jasmine, 1500; mulberry, 1520; mignonette, 1528; the plum, 1530; geranium, 1534; gooseberry, 1540; melons, 1540; hyssop, 1548; pomegranate, 1548; lemon, 1554; peach, 1562; carnation, 1567; pink, 1567; lavender, 1568; pineapple, 1568; quince, 1573; tulip, 1578; oleander, 1600; Virginia creeper, 1629; black walnut, 1629; hickory nut, 1640; nectarine, 1652; honeysuckle, 1656; sassafras, 1663; hawthorn, 1683; passion flower, 1692; raspberry, 1696; foxglove, 1696; currant, 1705; snowdrop, 1756; chrysanthemum, 1790; dahlia, 1803; camellia, 1811; petunia, 1823; verbena, 1827; fuchsia, 1835.

FOODS AND COOKERY.—Forks first used, 1220; sugar in Europe, 1250; first English cook book, 1498; cabbages, 1510; turkeys, 1523; guinea fowl, 1540; potatoes, 1565; cauliflower, 1603; tea, 1610; cattle imported to America, 1611; coffee, 1616; bread made with yeast, 1634; rice, 1690; celery, 1704; ice cream, 1760; United States fish culture, 1804; Liebig's extract, 1847; condensed milk, 1849; food adulteration act, 1854; aerated bread, 1856; cooking schools, 1873.

FUEL AND LIGHT.—Wood fuel, prehistoric; charcoal, B. C. 1800; oil lamps, B. C. 1000; wax candles, B. C. 200; peat, B. C. 60; rush lights, A. D. 1800; coal gas, 1739; Davy's safety lamp, 1802; sperm candles, 1811; paraffine, 1825; petroleum, 1859; natural gas, 1870; water gas, 1873; electric heating, 1876; incandescent electric light, 1878.

The Roman Month was divided into *Calends*, *Nones*, and *Ides*. The *Calends* always fell upon the first of the month; in March, May, July, and October, the *Nones* on the 7th and

the *Ides* on the 15th, and in the remaining months, the *Nones* on the 5th and the *Ides* on the 13th. The Roman year began with March, and the months corresponded with ours except that their fifth and sixth months were called *Quintilis* and *Sextilis*. Afterwards they were changed to July and August in honor of the emperors Julius and Augustus.

The Limits of Vision vary with elevation, conditions of the atmosphere, intensity of illumination, and other modifying elements in different cases. On a clear day an object one foot above a level plain may be seen at a distance of 1.31 miles; one 10 feet high, 4.15 miles; one 20 feet high, 5.86 miles; one 100 feet high, 13.1 miles; one a mile high, as the top of a mountain, 95.23 miles. This allows 7 inches; or, to be exact, 6.99 inches, for the curvature of the earth, and assumes that the size and illumination of the object are sufficient to produce an image.

Mottoes of the States.—*Ala.*, Here we rest. *Ark.*, Mercy, Justice; *Regnant populi* (The people rule). *Cal.*, *Eureka* (I have found it). *Col.*, *Nil sine numine* (Nothing without the Divinity). *Conn.*, *Qui transtulit sustinet* (He who has transplanted still sustains). *Del.*, Liberty and Independence. *Fla.*, In God we trust. *Ga.*, obverse, Wisdom, Justice, Moderation; reverse, Agriculture and Commerce. *Idaho*, *Esto perpetua* (Let it endure forever). *Ill.*, State Sovereignty. National Union. *Ia.*, Our liberties we prize and our rights we will maintain. *Kan.*, *Ad astra per aspera* (To the stars through rugged ways). *Ky.*, United we stand, divided we fall. *La.*, Union, Justice, and Confidence. *Me.*, *Dirigo* (I direct). *Md.*, *Fatti maschii parole femine* (Manly deeds and womanly words). *Mass.*, *Ense petit placidam sub libertate quietem* (By her sword she seeks under liberty a calm repose). *Mich.*, *Tuebor* (I will defend); *Si queris peninsulam amenam circumspecte* (If thou seekest a beautiful peninsula, look around). *Minn.*, *L'Etoile du Nord* (The Star of the North). *Mo.*, *Salus populi suprema lex esto* (Let the welfare of the people be the supreme law); United we stand, divided we fall. *Mon.* (Temporary), *Oro y plata* (Gold and silver). *Neb.*, Equality before the law. *N. Y.*, *Excelsior* (Higher). *Nev.*, All for our country. *N. C.*, *Esse quam videri* (To be, rather than to seem). *N. D.*, Liberty and Union, now and forever, one and inseparable. *Oregon*, The Union. *Penn.*, the obverse has no motto; on the reverse is the motto, "Both can't survive"; the state coat of arms carries the motto, "Virtue, Liberty, and Independence." *R. I.*, Hope. *S. C.*, *Dum spiro, spero* (While I breathe, I hope); *Spes* (Hope); *Animis opibusque parati* (Ready with our lives and

property). *S. D.*, Under God the people rule. *Tenn.*, Agriculture, Commerce. *Utah*, Industry. *Vt.*, Freedom and Unity. *Va.*, obverse, *Sic semper tyrannis* (So be it ever to tyrants); reverse, *Perseverando* (Perseverance). *W. Va.*, obverse, *Montani semper liberi* (The mountaineers are always free); reverse, Agriculture and Commerce. *Wis.*, Forward. *Wy.*, *Cedant arma togæ* (Let arms yield to the gown); Equal rights.

The following states have no mottoes: Indiana, Mississippi, New Hampshire, New Jersey, Ohio, Texas, Washington.

Barrenness.—One woman in 20, one man in 30—about 4 per cent. It is found that one marriage in 20 is barren—5 per cent. Among the nobility of Great Britain, 21 per cent. have no children, owing partly to intermarriage of cousins, no less than $4\frac{1}{2}$ per cent. being married to cousins.

Meteoric Stones.—A meteoric stone, which is described by Pliny as being as large as a wagon, fell near *Ægospotami*, in Asia Minor, in 487 B. C. About A. D. 1500 a stone weighing 1,400 pounds fell in Mexico, and is now in the Smithsonian Institution at Washington. The largest meteoric masses on record lay on the west coast of Greenland, and were found by the Swedish Exploring Expedition of 1870. One of them, now in the Royal Museum of Stockholm, weighs over 50,000 pounds, and is the largest specimen known. On February 12, 1875, an exceedingly brilliant meteor, in the form of an elongated horseshoe, was seen throughout a region of at least 400 miles in length and 250 in breadth, lying in Missouri and Iowa. It is described as "without a tail, but having a sort of flowing jacket of flame. Detonations were heard, so violent as to shake the earth and to jar the windows like the shock of an earthquake," as it fell, at about 10.30 o'clock P. M., a few miles east of Marengo, Iowa. The ground for the space of some seven miles in length by two to four miles in breadth was strewn with fragments of this meteor, varying in weight from a few ounces to seventy-four pounds. On May 10, 1879, a large and extraordinarily luminous meteor exploded with terrific noise, followed at slight intervals with less violent detonations, and struck the earth near Estherville, Iowa, penetrating to a depth of fourteen feet. Within two miles other fragments were found, one of which weighed 170 pounds and another thirty-two pounds. The principal mass weighed 431 pounds. All the discovered parts aggregated about 640 pounds. The one of 170 pounds is now in the cabinet of the State University of Minnesota. The composition of this aerolite is peculiar in many re-

spects; but, as in nearly all aerolites, there is considerable proportion of iron and nickel.

Woman Suffrage.—This is one phase of the demand for equal political, industrial, and educational opportunities for women. It was brought into prominence by the economic changes of the nineteenth century. In 1647 Margaret Brent demanded a seat in the Maryland Assembly as the representative of Lord Baltimore. The wife of John Adams asked that women should be recognized in the Constitution, and Hannah Lee Corbin protested against taxation without representation. By an inadvertence, the constitution of New Jersey granted woman suffrage from 1776 to 1807. The first Woman's Rights convention was held July 19, 1848, at Seneca Falls, N. Y., and its claims for women were based upon the Declaration of Independence. In 1869 two national associations were formed: The National Woman's Suffrage Association and the American Woman's Suffrage Association. In 1890 the two were finally united into the National American Woman's Suffrage Association. In the United States women possess suffrage upon equal terms with men at all elections in Wyoming, established 1869; Colorado, 1893; Utah as a territory, 1870-87, as a state 1896; Idaho, 1890. Women have school suffrage, varying in extent, in 25 states. North Dakota has had two women state superintendents. In Montana and Iowa women vote upon the issuance of municipal bonds; in New York, under certain conditions, on propositions to raise money by tax or assessment. In 1870, Massachusetts Republican Convention admitted Lucy Stone and Mary A. Livermore as regularly accredited delegates. Women have addressed both Democratic and Republican national conventions: the Republican at Cincinnati, 1876, the Democratic at St. Louis, 1876, and Cincinnati, 1880. Women delegates from Utah and Wyoming sat in the Republican conventions of 1892 and 1900. In 1900, Bryan's nomination was seconded by Mrs. Cohen of Utah. The Prohibition, Greenback, Labor, and Socialist parties have declared for equal suffrage. Labor organizations, including the Knights of Labor and the American Federation of Labor, have generally been favorable to woman suffrage.

Women have full suffrage in New Zealand, Isle of Man, Pitcairn Island, and in Australia under the new constitution; in Canada, Cape Colony, and in parts of India, municipal and school suffrage, on various terms; in Tasmania and Siberia, municipal suffrage. Women in England, Scotland, and Ireland can vote in all except Parliamentary elections. In France, women teachers vote for school directors, and woman in commerce for judges of tribunals of

commerce. In Sweden they vote at all elections except those for representatives; indirectly they vote for members of the House of Lords. In Norway they have school suffrage. Russian women, as householders, vote for all elective officers and on local matters. In Italy, widows with property vote by proxy for members of Parliament. Women taxpayers of Belgium, Luxemburg, and Roumania have municipal suffrage by proxy. Women property owners vote, by proxy, on certain questions in Westphalia, Schleswig-Holstein, Brunswick, Saxony, Bohemia (in municipal matters), and Austria-Hungary. In Croatia and Dalmatia, they vote in person at local elections.

Consumption.—Of the total number of deaths, the percentage traceable to consumption in the several states and territories is as follows: Alabama, 9.6; Arizona, 6.1; Arkansas, 6.4; California, 15.6; Colorado, 8.2; Connecticut, 15.1; Dakota, 8.8; Delaware, 16.1; District of Columbia, 18.9; Florida, 8.3; Georgia, 7.9; Idaho, 6.8; Illinois, 10.3; Indiana, 12.6; Iowa, 9.9; Kansas, 7.3; Kentucky, 15.7; Louisiana, 10.4; Maine, 19.2; Maryland, 14.0; Massachusetts, 15.7; Michigan, 13.02; Minnesota, 9.3; Mississippi, 8.8; Missouri, 9.8; Montana, 5.6; Nebraska, 8.8; Nevada, 6.3; New Hampshire, 5.6; New Jersey, 8.9; New Mexico, 2.4; New York, 8.1; North Carolina, 9.5; Ohio, 13.8; Oregon, 12.1; Pennsylvania, 12.6; Rhode Island, 14.6; South Carolina, 9.8; Tennessee, 14.5; Texas, 6.5; Utah, 2.8; Vermont, 16.1; Virginia, 12.2; Washington, 13.2; West Virginia, 13.0; Wisconsin, 10.4; Wyoming, 2.6. Average, 12.0.

Presidents Inaugurated Irregularly.—George Washington, April 30, 1789; James Monroe, second term, March 5, 1821; John Tyler, April 6, 1841; Zachary Taylor, March 5, 1849; Millard Fillmore, July 10, 1850; Johnson, Apr. 15, '65; Hayes, Mar. 5, '77; Arthur, Sept. 20, '81; Roosevelt, Sept. 14, '01.

Women, Myths of the Origin of.—Woman's first appearance has been a fruitful subject of legends. The Phœnician myth of creation is found in the story of Pygmalion and Galatea. There the first woman was carved by the first man out of ivory, and then endowed with life by Aphrodite. The Greek theory of the creation of woman, according to Hesiod, was that Zeus, as a cruel jest, ordered Vulcan to make woman out of clay, and then induced the various gods and goddesses to invest the clay doll with all their worst qualities, the result being a lovely thing, with a witchery of mien, refined craft, eager passion, love of dress, treacherous manners, and shameless mind. The Scandinavians say that as Odin, Vill, and Ve, the three sons of Bor, were walk-

ing along the sea beach, they found two sticks of wood, one of ash, and one of elm. Sitting down, the gods shaped man and woman out of these sticks, whittling the woman from the elm, and calling her Ernia. One of the strangest stories touching the origin of woman is told by the Madagascarenes. In so far as the creation of man goes, the legend is not unlike that related by Moses, only that the fall came before Eve arrived. After the man had eaten the forbidden fruit, he became affected with a boil on the leg, out of which, when it burst, came a beautiful girl. The man's first thought was to throw her to the pigs; but he was commanded by a messenger from heaven to let her play among the grass and flowers until she was of marriageable age, then to make her his wife. He did so, called her Baboura, and she became the mother of all races of men. The American Indian myths relative to Adam and Eve are numerous and entertaining. Some traditions trace back our first parents to white and red maize; another is that man, searching for a wife, was given the daughter of the king of muskrats, who, on being dipped into the waters of a neighboring lake, became a woman.

Gotham.—The origin of the name "Gotham," as applied to the city of New York, is contained in a humorous book called "Salmagundi," written by Washington Irving, his brother William, and James K. Paulding, and is used to signify that the inhabitants were given to undue pretensions to wisdom. This definition of the word is taken from a story regarding the inhabitants of Gotham, a parish in Nottinghamshire, England, who were as remarkable for their stupidity as their conceit. The story relates that when King John was about to pass through Gotham toward Nottingham, he was prevented by the inhabitants, who thought that the ground over which a king passed became forever a public road. When the king sent to punish them they resorted to an expedient to avert their sovereign's wrath. According to this, when the messengers arrived they found the people each engaged in some foolish occupation or other, so they returned to court and reported that Gotham was a village of fools. In time a book appeared entitled "Certain Merry Tales of the Mad Men of Gotham," compiled in the reign of Henry VIII. by Andrew Borde, a sort of traveling quack, from whom the occupation of the "Merry Andrew" is said to be derived. Among these tales is the story of "The Three Wise Men of Gotham," who went to sea in a bowl.

Hallows Eve, or Halloween, is the night of October 31st, the eve of All Saints', or All-hallows Day, which is November 1st, and is probably a relic of pagan times or of mediæval

superstitions, as it has nothing whatever to do with the church festival. In England and Scotland it is especially selected as the time for trying spells and divinations in love affairs. The superstitious tradition regarding it is that it is the night of all others when supernatural influences prevail; when spirits of the invisible and visible world walk abroad, for on this mystic evening it was believed that the human spirit was enabled, by the aid of supernatural power, to detach itself from the body and wander through the realms of space. There is a similar superstition in Germany concerning "Walpurgis night"—the night preceding the first of May. On this night, the German peasants believe that there is a witch festival, or gathering of evil spirits, on the summit of the Brocken, in the Hartz Mountains, and the malign influence of this convocation was believed to be felt all over the surrounding country. It was an old custom, and still observed in some places, to light great bonfires of straw or brush on that night, to drive away the spirits of darkness supposed to be hovering in the air. Considering that All Saints' Day was originally kept on May 1st, there would appear to be but little doubt that Allhallow eve and Walpurgis night have a common origin, which, doubtless, dates back to the earliest belief in a personal and all-powerful Evil One—the Chaldean's Power of Darkness.

Mammoth Cave, The, is situated in Edmondson County, near Green River, Kentucky, and extends some nine miles. It contains a succession of wonderful avenues, chambers, domes, abysses, grottoes, lakes, rivers, and cataracts. One chamber, the Star, is about 500 feet long, 70 feet wide, and 70 feet high; the ceiling is composed of black gypsum, and is studded with innumerable white points, that by a dim light resemble stars; hence the name. There are avenues one and a half and even two miles in length, some of which are incrustated with beautiful formations, and present a most dazzling appearance. There is a natural tunnel about three quarters of a mile long, 100 feet wide, covered with a ceiling of smooth rock, 45 feet high. Echo River is some three fourths of a mile in length, 200 feet in width at some points, and from 10 to 30 feet in depth, and runs beneath an arched ceiling of smooth rock about 15 feet high; while the Styx, another river, is 450 feet long, from 15 to 40 feet wide, and from 30 to 40 feet deep, and is spanned by a natural bridge. Lake Lethe has about the same length and width as the river Styx, varies in depth from 3 to 40 feet, lies beneath a ceiling some 90 feet above its surface, and sometimes rises to a height of

60 feet. There is also a Dead Sea. The entrance to the cave is reached by passing down a wild, rocky ravine through a dense forest. To visit the portions of this wonderful cave already traversed requires, it is said, 150 to 200 miles of travel.

Yosemite Valley, or, as it is also called, Yohamite, is situated in the eastern portion of California, and is from 8 to 10 miles long, and a little more than a mile wide. In some places the valley is filled with noble oaks; in others it opens out into broad, grassy fields. The natural beauties of this region are of world-wide report. It has pine-covered mountains, towering, with very steep slopes, to the height of 3,500 feet, a precipice, or bluff, in one place rising perpendicularly 3,089 feet above the valley; in another, a rock, almost perpendicular, 3,270 feet high; waterfalls pouring over its sides from heights of 700 to almost 1,000 feet; and one great waterfall broken into three laps, but of which the whole height is 2,550 feet. Of the other waterfalls on the sides of the valley, the Pohono, or Bridal Veil Waterfall, is particularly to be remarked for its beauty, as well as for its height, which is 940 feet, and almost unbroken. The Yosemite Valley was first entered by white men in 1855, but now, like the valleys of Switzerland, has its hotels and guides, and is yearly visited by American and foreign tourists.

Great Eastern, The.—The largest ship in the world, the Great Eastern, was constructed by the Eastern Navigation Company of London. The work of construction commenced May 1, 1854, and the work of launching her, which lasted from November 3, 1857, to January 31, 1858, cost £60,000, hydraulic pressure being employed. Her extreme length is 680 feet; breadth, 82 1-2 feet, and including paddle-boxes, 118 feet; height, 58 feet, or 70 feet to top of bulwarks. She has 8 engines, capable in actual work of 11,000 horse power, and has, besides, 20 auxiliary engines. The ship's history presents a singular series of vicissitudes. She left the Thames September 8, 1859, on her trial trip across the Atlantic; an explosion of steam pipes took place off Hastings; seven persons were killed, and several wounded; and the voyage abruptly came to an end at Weymouth. After a winter spent in costly repairs, the ship started again on June 17, 1860. Leaving Southampton on that day, she crossed the Atlantic in eleven days, and reached New York on the 28th. During the remainder of 1860, and the greater part of 1861, she made many voyages to and fro, losing money by the insufficiency of the receipts to meet the current expenses, and constantly required repairs. In December of the latter

year she was used as a troop ship to convey troops to Canada. The years 1862 to 1864 were a blank as concerns the history of the steamer. In 1864 she was employed by the Atlantic Telegraph Company as a cable-laying ship, and continued in such service during 1865 and 1866. In 1867, when the preparations for the Paris International Exhibition were approaching completion, a body of speculators chartered the Great Eastern for a certain number of months, to convey visitors from New York to Havre and back; but the speculation proved an utter failure, there being neither wages for the seamen and engineers, nor profits for the speculators. In 1868 the ship was again chartered by the Telegraph Construction and Maintenance Company. On October 28, 1885, the Great Eastern was sold at public auction for \$126,000.

Giant's Causeway.—The name Giant's Causeway is often applied to the entire range of cliffs in the County Antrim, on the north-east coast of Ireland, but it properly belongs to only a small portion of them, which is a platform of basalt in closely arranged columns, from fifteen to thirty-six feet high, which extends from a steep cliff down into the sea till it is lost below low-water mark. This platform is divided across its breadth into three portions, the Little, Middle, and Grand Causeway, these being separated from each other by dikes of basalt. The columns are generally hexagonal prisms, but they are also found of five, seven, eight, and nine sides, in almost every instance being fitted together with the utmost precision, even so that water cannot penetrate between adjoining columns. The name "causeway" was given to the platform because it appeared to primitive imagination to be a road to the water, prepared for giants.

Golden Fleece, The.—According to Greek tradition, Pelias, King of Iolcos, in Thessaly, dethroned the rightful King Æson and endeavored to kill his son Jason, who was, however, saved by his parents, who conveyed him by night to the cave of the centaur Chiron, to whose care they committed him, and then gave out that he was dead. He remained with Chiron until he was twenty years of age and then went to claim his father's crown. Pelias agreed to surrender the kingdom to Jason provided he brought him the golden fleece from Colchis, expecting that he would never attempt it, or, if he did, would surely perish in the rash adventure. One of the myths of the fleece is that Ino, second wife of Athamas, King of Orchomenus, in Boeotia, wished to destroy Phrixus, son of Athamas; but he and Helle were saved by their mother, Nephele, who gave them a golden fleeced ram she had obtained

from Mercury, which carried them through the air over sea and land. Helle fell into the sea, and it was named Hellespontus. Phrixus went on to Colchis, where he was kindly received, and sacrificed the ram to Jupiter Phryxius, and gave the golden fleece to Æetes, who nailed it to an oak in the grove of Mars, where it was watched over by a sleepless dragon. Jason, by heralds, announced the great undertaking throughout the land, and all the heroes of Greece flocked to his assistance, and the famous company were called the "Argonauts," from the name of their ship, Argo, which was built for them by Argus, with the aid of Minerva. After a voyage of varied adventure the heroes reached Colchis, and Jason explained the cause of his voyage to Æetes; but the conditions on which he was to recover the golden fleece were so hard that the Argonauts must have perished had not Medea, the king's daughter, fallen in love with their leader. She had a conference with Jason, and after mutual oaths of fidelity Medea pledged herself to deliver the Argonauts from her father's hard conditions if Jason would marry her and carry her with him to Greece. He was to tame two bulls which had brazen feet and breathed flame from their throats. When he had yoked these, he was to plow with them a piece of ground, and sow the serpent's teeth which Æetes possessed. All this was to be performed in one day. Medea, who was an enchantress, gave him a salve to rub on his body, shield, and spear. The virtue of this salve would last an entire day and protect alike against fire and steel. She further told him that when he had sown the teeth a crop of armed men would spring up and prepare to attack him. Among these she desired him to fling stones, and while they were fighting with one another about them, each imagining that the other had thrown the stones, to fall on and slay them. All of these things were done by Jason, but Æetes refused to give the fleece, and meditated burning the Argo, Jason's vessel, and slaying her crew. Medea, anticipating him, led Jason by night to the golden fleece; with her drugs she put to sleep the serpent which guarded it; and then, taking her little brother Absyrtus out of his bed, she embarked with him in the Argo, and the vessel set sail while it was yet night. They were pursued by Æetes, when Medea killed her brother and threw his body into the sea piece by piece, thus delaying the king, who stopped to gather up the remains, leaving the Argonauts to escape. After many months of toil and numerous trials they at last reached Iolcos, and the Argo was consecrated by Jason, on the Isthmus of Corinth, to Neptune.

The Armed Strength of Europe.

† Including native and white troops.

CONDITIONS OF SERVICE AND AVAILABLE STRENGTH OF POWERS.

Every year the young men who attain the age in which they are available for military service are enrolled, in advance, in every European country. These ages run generally from 21 to 45, and this time is divided up by service; first, in the active army, which answers to our regular establishment; second, in the reserve to the active army; third, in the Landwehr; fourth, in the Landsturm, in which they are never called out, except in time of war, and then for defense of the fatherland only.

Liberty Bell was cast in London in 1752 by order of the Pennsylvania Assembly, for use in their State House. The bell reached Philadelphia the following year, but it cracked without any apparent reason when it was rung to test the sound, and it was necessary to have it recast. This was done by Philadelphia workmen, and in June, 1753, it was again hung in the belfry of the State House. On July 4, 1776, when the Continental Congress declared the colonies independent of Great Britain, the bell was rung for two hours, so

the story goes, by the old bellman, who was so filled with enthusiasm and excitement that he could not stop. It was taken down when the British threatened Philadelphia in 1777, and removed to Allentown, Pa., but was returned to the State House in 1778, and a new steeple was built for it. A few years afterward it cracked under a stroke of the hammer, and although an attempt has been made to restore its tone by sawing the crack wider, it has been unsuccessful. During the World's Fair in New Orleans in 1885, the bell was sent there for exhibition. It left Philadelphia, January 24th, in the charge of three custodians appointed by the mayor of the city, who did not leave it day or night until it was returned in June of the same year. The train carrying the bell was preceded over the entire route by a pilot engine. The following words are inscribed around it: "By order of the Assembly of the Province of Pennsylvania, for the State House, in the City of Philadelphia, 1752," and underneath, "Proclaim liberty through all the land unto all the inhabitants thereof—Levit. xxv. 10." Its weight is about 2,000 pounds.

Sizes of Books.—The name indicates the number of pages in the sheet, thus: in a folio book, 4 pages or 2 leaves = 1 sheet; a quarto, or 4to, has 8 pages or 4 leaves to a sheet; an octavo, or 8vo, 16 pages or 8 leaves to a sheet. In a 12mo, 24 pages or 12 leaves = one sheet, and the 18mo, 36 pages, or 18 leaves = 1 sheet, and so on. The following are the approximate sizes of books:—

| | | |
|-------------------------------|-----------|------|
| Royal Folio | 19 inches | × 12 |
| Demy | 18 " | × 11 |
| Super Imp. Quarto (4to) | 15½ " | × 13 |
| Royal 4to | 12½ " | × 10 |
| Demy 4to | 11½ " | × 8½ |
| Crown 4to | 11 " | × 8 |
| Royal Octavo | 10½ " | × 6½ |
| Medium 8vo | 9½ " | × 6 |
| Demy 8vo | 9 " | × 5½ |
| Crown 8vo | 7½ " | × 4½ |
| Foolscap 8vo | 7 " | × 4 |
| 12mo | 7 " | × 4 |
| 16mo | 6½ " | × 4 |
| Square 16mo | 4½ " | × 3½ |
| Royal 24mo | 5½ " | × 3½ |
| Demy 24mo | 5 " | × 2½ |
| Royal 32mo | 5 " | × 3 |
| Post 32mo | 4 " | × 2½ |
| Demy 48mo | 3½ " | × 2½ |

Boomerang is an instrument of war or of the chase used by the aborigines of Australia. It is of hard wood, of a bent form; the shape is parabolic. It is about two and a half inches broad, a third of an inch thick, and two feet long, the extremities being rounded. The method of using this remarkable weapon is very peculiar. It is taken by one end, with the bulged side downward, and thrown forward as if to hit some object twenty-five yards in advance. Instead of continuing to go di-

rectly forward, as would naturally be expected, it slowly ascends in the air, whirling round and round, and describing a curved line till it reaches a considerable height, when it begins to retrograde, and finally sweeps over the head of the projector and falls behind him. This surprising motion is produced by the reaction of the air upon a missile of this peculiar shape. The boomerang is one of the ancient instruments of war of the natives of Australia. They are said to be very dexterous in hitting birds with it—the birds, being, of course, behind them, and perhaps not aware that they are objects of attack.

Strasburg Clock.—The celebrated astronomical clock of Strasburg is in the minster, or cathedral, and was originally designed by an astronomer named Isaac Habrecht, in the

early part of the sixteenth century. Previous to this time, in fact as early as 1354, Strasburg had an astronomical clock. It was in three parts. The lower part had a universal calendar, the central part an astrolabe, and in the upper division were figures of the three Magi and the Virgin. At every hour the Magi came forward and bowed to the Virgin; at the same time a chime was played, and a mechanical cock crew. This Clock of the Magi, as it was called, stopped in the early part of the sixteenth century, and was replaced by the clock made by Habrecht, which ran until 1789, when it stopped, and all attempts to put its works in order failed. In 1838 a clock-maker named Schwilgue undertook to remodel the internal machinery, and finished it in 1842. The case of the clock made by Habrecht was retained. A perpetual calendar, forming a ring around a dial thirty feet in circumference, occupies the central part of the lower division of the clock. At midnight, December 31st, the clock regulates itself (for the new year) for 365 or 366 days, as the case may be—even the omission of the bissextile day every 400 years being provided for. The disk within the calendar shows the eclipses of the sun and moon, calculated for all time to come. On one side Apollo points with an arrow to the date and name of the saint for the day. On the opposite side stands Diana, the goddess of night. Above the calendar is a niche in which, on each day, the mythological deity of the day appears—Apollo on Sunday, Diana on Monday, Mars on Tuesday, Mercury on Wednesday, Jupiter on Thursday, Venus on Friday, and Saturn on Saturday. Above this is a dial marking the mean time in hours and quarters, with two genii, one on each side, the one striking the first stroke of every quarter, the other turning over the hourglass at the last stroke of the last quarter. Then follows an orrery, showing the revolution of the seven visible planets around the sun, and, above, a globe giving the phases of the moon. Still above this, in a niche, four figures revolve around the skeleton image of Death, in the center. Childhood strikes the first quarter, Youth the second, Manhood the third, and old Age the last—Death strikes the hour. In a higher niche stands the image of our Saviour. At twelve o'clock the Twelve Apostles pass before Him in line, and He raises His hands to bless them. St. Peter closes the procession, and, as he passes, the mechanical cock on top of the case flaps his wings and crows three times. The left turret of this wonderful clock contains the weights and machinery, and has in its lower part the portrait of Schwilgue, above this the figure of Copernicus, and yet above, the muse Urania. At the foot of the

case is a celestial globe, calculated for observation at the latitude of Strasburg. The clock is wound up every eight days. The mythical story of the city fathers of Strasburg putting out the eyes of the clockmaker to prevent his building a similar clock refers to Isaac Habrecht.

Age.—A man's working life is divided into four decades: 20 to 30, bronze; 30 to 40, silver; 40 to 50, gold; 50 to 60, iron. Intellect and judgment are strongest between 40 and 50. The percentages of population to age in various countries are shown thus:—

| COUNTRY. | PERCENTAGE OF POPULATION. | | | Average age of all living. Years. |
|------------------|---------------------------|---------------|----------|-----------------------------------|
| | Under 20 Years. | From 20 to 40 | Over 40. | |

| Norway..... | 43 | 48 | 9 | 28.0 |

The Americans are the youngest, the French the oldest.

Garter, Order of The, was founded in 1344, some writers say 1350, by Edward III. The original number of knights was twenty-five, his majesty himself making the twenty-sixth. It was founded in honor of the Holy Trinity, the Virgin Mary, St. Edward the Confessor, and St. George. The last, who had become the tutelary saint of England, was considered its special patron, and for this reason it has always borne the title of "The Order of St. George," as well as that of "The Garter." The emblem of the order is a dark blue ribbon, edged with gold, bearing the motto, *Honi soit qui mal y pense*, in golden letters, with a buckle and pendant of gold richly chased. It is worn on the left leg below the knee. Regarding the adoption of this emblem and motto, the story is that the Countess of Salisbury let fall her garter when dancing with the king, and that he picked it up and tied it round his own leg, but that, observing the jealous glances of the queen, he restored it to its fair owner, with the exclamation, *Honi soit qui mal y pense*. The Order of the Garter, though not the most ancient, is one of the most famous military orders of Europe. It is said to have been devised for the purpose of attracting to the king's party such soldiers of fortune as might be likely to aid in asserting the claim which he was then making to the crown of France, and intended as an imitation of King

Arthur's Round Table. The officers of the order are the Prelate, the Chancellor, the Registrar, the Garter King of Arms, and the Usher of the Black Rod.

Yellowstone Park is situated, the greater part, in Wyoming, the remainder partly in Montana and partly in Idaho, and comprises 3,575 square miles. The adaptability of this section of the country to the purposes of a national park was first brought prominently before the public by a company of surveyors who visited the region in the year 1869. In 1870 and 1871 the territory was again explored by scientific expeditions, and the reports of the first visitors were confirmed. The expedition of 1871 was headed by Profes-

sor Hayden, and upon his representations an act was passed by Congress, and approved March 1, 1872, by which what is now known as the Yellowstone National Park was "reserved and withdrawn from settlement, occupancy, or sale, and dedicated and set apart as a public park or pleasure-ground for the benefit and enjoyment of the people." This great park contains the most striking of all the mountains, gorges, falls, rivers, and lakes in the whole Yellowstone region. The mountain ranges rise to the height of from 10,000 to 12,000 feet, and are always covered with snow. The banks of the Yellowstone river abound with ravines and canyons, which are carved out of the heart of the mountains through the hardest rocks. The most remarkable of these is the canyon of Tower Creek and Column Mountain, which is about ten miles in length, and is so deep and gloomy that it is called "The Devil's Den." The Grand Canyon, which begins where Tower Creek ends, is twenty miles in length, is impassable throughout, and is inaccessible at the water's edge except at a few points, and its depth is so profound that no sound ever reaches the ear from the bottom. The Park contains a great multitude of hot springs of sulphur, sulphate of copper, alum, etc. There are at least 50 geysers that throw columns of water to the height of from 50 to 200 feet, and the falls of this wonderland are considered marvelous. The altitude of the entire Park is 6,000 feet or more above the sea level.

Aqueducts.—Among modern works the most famous are:—

| | Length. Miles. | Million gal's daily. | Cost. |
|------------------------|-------------------|-------------------------|-------------|
| Croton (New York)..... | 41 | 85 | \$9,000,000 |
| Madrid..... | 47 | 40 | 11,500,000 |
| Marseilles..... | 51 | 60 | 2,250,000 |
| Glasgow..... | 34 | 50 | 7,775,000 |
| Washington..... | 16 | 90 | |

Rome, in the time of the Cæsars, had nine aqueducts, measuring 249 miles in the aggregate, and with a daily capacity of 320,000,000 gallons, or 200 gallons per inhabitant. The great aqueduct of Peru, built by the Incas, was 360 miles long.

Watches of the Night.—The Jews, like the Greeks and Romans, says the Rev. Dr. William Smith in his "Bible Dictionary," divided the night into watches instead of hours, each watch representing the period for which sentinels or pickets remained on duty. The proper Jewish reckoning recognized only three such watches, entitled the first or "beginning of the watches" (Lamentations ii, 19), the middle watch (Judges vii, 19), and the morning watch (Exodus xiv, 24; I Samuel xi, 11). These would last, respectively, from sunset to ten o'clock P. M., from ten o'clock P. M. to

two o'clock A. M., and from two o'clock A. M. to sunrise. After the establishment of the Roman supremacy the number of the watches was increased to four, which were described either according to their numerical order, as in the case of the "fourth watch" (Matthew xiv, 25), or by the terms "even," "midnight," "cockcrow," and "morning" (Mark xiii, 35). These terminated, respectively, at nine o'clock P. M., midnight, three o'clock A. M., and six o'clock A. M.

Walkyries.—The name "Walkyries" is derived from the old Norse *val*, which signifies a heap of slaughtered men, and *kjora*, to choose. In the Scandinavian mythology the Walkyries, also called battle-maidens, shield-maidens, and wish-maidens, are beautiful young women, who, adorned with golden ornaments, ride through the air in brilliant armor, order battles and distribute the death-lots according to Odin's command. Fertilizing dew-drops on the ground from the manes of their horses, light streams from the points of their lances, and a flickering brightness announces their arrival in the battle. They rejoice the glazing eye of the hero with their charming glances, and lead him to Walhalla, where they act as his cup-bearers. Some of the Walkyries spring from elves and other superhuman beings; some, also, are the daughters of princes. They ride generally in companies of three, or of three times three, or four times three, and have the gift of changing themselves into swans. Whoever deprives a Walkyrie of her swan-robe gets her into his power.

Mourning Customs.—From the earliest times the manner of expressing grief at death has differed in different countries. The Hebrew period of mourning was usually seven days; but in some instances, as at the death of Moses and Aaron, it was extended to thirty days. The mourners tore their clothing, cut off the hair and beard, strewed ashes on their heads, and cast themselves on the ground, weeping and smiting their breasts. The Greeks mourned thirty days, except in Sparta, where the mourning period was limited to ten days, and wore coarse black garments, cut off their hair, and secluded themselves from the public gaze. In the event of the death of a great general, the whole army cut off their hair, and also the manes of their horses. The Roman mourning period lasted only a few days; but if the death was that of some great ruler or general, all business was stopped, and the forum and the schools were closed. Among the Fiji Islanders the women are required to burn their bodies on the death of a chief, and in the Sandwich Islands the people go into mourning by knocking out the front teeth and by paint-

ing the lower part of the face black. The mourning color among the Romans under the republic was black or dark blue for both sexes, but during the empire the women wore white. In Europe and America the color is black; in Turkey, it is violet; in China, white; in Egypt, yellow; in Ethiopia, brown. It is customary for the courts in all European countries to go into mourning on the occasion of the death of a member of a royal family. The custom of draping buildings on the death of a great man or a hero of national reputation has always prevailed in the United States.

Natural Gas.—The earliest use of natural gas of which there is any record is in China, where for centuries it has been conveyed from fissures in salt-mines to the surface through hollow bamboos and used for burning purposes. There are also places in Asia, near the Caspian Sea, where it is seen to issue from the earth, and a similar phenomenon is to be seen in the Szalatna salt-mine in Hungary. The first discovery of natural gas made in America was in the neighborhood of Fredonia, Chautauqua County, New York, early in this century. In 1821 a small well was bored in the village and the gas was conducted through pipes to the houses and used for illuminating purposes, and, on the occasion of Lafayette's visit in 1824, it is said that the village was illuminated with this gas. Although this discovery was widely known it did not lead to any further experiments, either in the neighborhood or in other places, till fully twenty years after. In the early part of the present century it was found that the wells which were bored for salt in the Kanawha Valley yielded large quantities of gas, but it was not utilized as fuel until 1841. In 1865, a well which was sunk for petroleum at West Bloomfield, New York, struck a flow of natural gas. An effort was made to utilize this, and it was carried in a wooden main to the city of Rochester, a distance of twenty-four miles, in 1870, for the purpose of illuminating the city, but the experiment was a failure. In 1873, a well in Armstrong County, Pennsylvania, was so arranged that the gas could be separated from the water with which it was discharged, and conveyed through pipes to several mills in that vicinity, where it was extensively used for manufacturing purposes for the first time. From that date to the present day the use of natural gas, both for fuel and illuminating, has increased very rapidly, it having been discovered in other parts of Pennsylvania, Ohio, and Indiana.

Associated Press was organized about thirty years ago by the following New York city papers: *Herald*, *Tribune*, *World*, *Time*,

Sun, Evening Express, and Journal of Commerce, for the purpose of facilitating the collection of news. The general agent of the Association is located in New York, and associate agents in Chicago, Washington, Cincinnati, and other news centers. There is also a complete reportorial staff, and the news collected is used not only by the syndicate of papers, but is transmitted by telegraph to others in almost every city in the country who have secured the privilege by purchase.

All Fools' Day.—The origin of the custom of April fooling cannot be traced with any degree of certainty. In the literature of the last century there are found many references to it, and yet beyond that it is scarcely possible to go. One suggestion is that the custom of playing tricks on the first day of April was derived from some ancient pagan custom, such as the Huli festival among the Hindoos, or the Roman Feast of the Fools. One fact, however, we do know, and that is that the practice prevails in many countries, under various names, which would seem to indicate that it dates away back to the early history of the race.

Palmistry.—The art of studying the lines in the palm, to discover the character and fortunes of a person, was practiced in ancient India and Greece. The subject was noticed by Aristotle, Pliny, Paracelsus, Albertus Magnus, and Cardan. A work by Johann Hartlieb was published in Augsburg, in 1475. M. le capitaine d'Arpentigny and M. Adrien Desbarrolles are chief modern authorities. L. Cotton's "Palmistry" was published in 1890, and Dr. Francis Galton published his study of "Finger Prints" in 1893.

Pavements.—The Carthaginians are said to have been the first who paved their towns with stones. The Romans, in the time of Augustus, had pavement in many of their streets; the Appian way, a paved road, was constructed 312 B. C. In England there were few paved streets before the time of Henry VII. London was first paved about 1583. It was paved with flagstones between 1815 and 1825. Among modern paving materials are brick, stone, wood, asphaltum, and many kinds of concrete.

Bookkeeping.—The system by double entry, called originally Italian bookkeeping, was taken from the course of algebra published by Burgo, in the fifteenth century, at Venice. John Gough, a printer, published a treatise on "Debitor and Creditor," in London, 1543. This was the earliest English work on bookkeeping, and the forerunner of many improved efforts.

Democrats, advocates of government

by the people themselves, is a term first adopted by the French republicans in 1790; they termed their opponents *aristocrats*. The name *Democrats* was also adopted by the pro-slavery party in the United States, and the abolitionists were called *Republicans*. Into these two parties a number of smaller ones were absorbed at the presidential election in 1856.

The Twentieth Century began at midnight of December 31, 1900; the year 1901 is therefore the first year of the century. It will contain 25 leap years, and will have 36,525 days, which are equal to 5,218 weeks, lacking one day. It began on Tuesday, and will end on Sunday. February will have five Sundays in 1920, 1948, and 1976.

Carrier Pigeons.—That pigeons have been used for a great many years for the transmission of messages is well known, but with what nation the custom originated it is impossible to discover. The Romans used the birds for this purpose, they were in use among the Asiatics, and we have the assertion of the poet Tasso for believing that they were employed during the siege of Jerusalem in 1099; and it is a historical fact that they were used during the crusade of St. Louis, in 1250. Their most remarkable use in modern times was during the siege of Paris, in 1870. In Turkey they have been more generally used than in any other country, and it is said that there the art of training them is carried to its highest perfection. Pigeons intended for this use are taken, when they have acquired full strength of wing, in a covered basket to a distance of about half a mile from their home, and then set at liberty and thrown into the

air. If they return home they are then taken to greater distances, progressively increased from forty to fifty miles. When the bird is able to accomplish this flight he may be trusted to fly any distance, overland, within the limits of physical power. It is the general plan to keep the birds in a dark room for some hours before they are used. They are then fed sparingly, but are given all the water they can drink. The paper on which the message is written is tied around the upper part of the bird's leg, or to one of the large feathers of the tail, so as not to impede its flight. The feet are washed in vinegar to keep them from getting too dry, so that the bird will not be tempted to descend to water and thus possibly ruin the message. The rate of flight is from twenty to thirty miles an hour, though the bird has been known to pass over great distances much more rapidly. When thrown up in the air, the pigeon at first flies round and round, as though for the purpose of sighting some landmark that it knows. When this is discovered, it flies toward it, and thence onward to its home.

Emancipation in Great Britain.—The system of slavery was abolished throughout all the British Colonies by act of Parliament in 1833, when a bill was passed which gave freedom to all classes and indemnified their owners with an award of £20,000,000. According to this act, slavery was to cease on August 1, 1834, but the slaves were to continue with their former owners as apprentices for a certain period. This apprenticeship, however, did not work satisfactorily to either side, and complete emancipation took place in 1838. In 1787 the subject of the suppression of the slave trade was agitated in London and received the support of Mr. Pitt, the Prime Minister, and William Wilberforce, a member of Parliament, and in 1791 a bill forbidding the further importation of slaves was offered by Wilberforce in Parliament, but was not passed. The conquest of the Dutch colonies in America by the British led to such an increase in the British slave-trade that in 1805 the traffic was forbidden in the conquered colonies; and in 1806 the friends of emancipation gained still another step by the passage of an act forbidding British subjects to engage in the trade, and the following year a general abolition bill making all slave-trade illegal after January 1, 1808, was adopted by Parliament. This, however, did not have the desired effect, as British subjects still continued the trade under the flags of other nations. So, in 1811, it was made a felony, punishable with imprisonment at hard labor or transportation; and subsequent laws made it piracy, to be

punished with transportation for life. From this time until the passage of the Emancipation bill the subject was continually pressed upon the attention of Parliament. Slavery existed in Great Britain in Saxon and Norman times, when the peasantry were sold in the market like cattle for exportation, and were looked upon as mere chattels, to be bought and sold with the land upon which they toiled. In Scotland, even as late as 1780, a law existed which compelled colliers, on entering a mine, to perpetual service there, the right to their labor passing with the mine to an inheritor or purchaser, and their children being in like manner attached to the mine, and forbidden under severe penalty to seek other employment.

Trojan War.—The legend regarding the Trojan war has, undoubtedly, a historical origin, in the fact of the actual destruction of Troy by a Grecian military expedition. About 1194-'84 B. C., according to the traditions, Paris, one of the sons of Priam, enticed Helen, the beautiful wife of Menelaus, King of Sparta, away from her husband, and, at the call of Menelaus all the heroes of Greece flew to arms to avenge this wrong. The Grecian host numbered 100,000 warriors, among whom were Ulysses, Achilles, Ajax, Diomed, and Agamemnon, who, as brother of Menelaus, was chosen to lead the expedition. The siege of the city of Priam lasted ten years. Finally the Greeks, by the device of Ulysses, built an immense wooden horse, in which they concealed a number of their warriors, and left it on the plain in sight of the city, and then retired to their ships as though abandoning the siege. The Trojans, believing that the statue was left as a propitiatory offering to their gods, carried it within their walls, and at night the concealed warriors issued from the horse and opened the gates of the city to their returned comrades, and Troy was sacked and burned. The king and all his sons were killed; in fact, according to the legend, Æneas, and his father, Anchises, and a few devoted followers, were the only ones to escape, and these, after long wanderings by sea and land, finally settled on the shores of Etruria, in Italy. The battles which were fought before the walls of Troy have been immortalized by Homer in the "Iliad."

Bride, Throwing Shoe after.—The custom of throwing a shoe after a departing bride and groom originated so far back in the dim and mystical past that the memory of man stretcheth not back to its beginning. It is by some thought to typify an assault, and is a lingering trace of the custom among savage nations of carrying away the bride by violence. Others claim that it has a likeness to a Jewish custom mentioned in the Bible. Thua. in

Ruth, when the kinsman of Boaz gave up his claim to the inheritance of Ruth, and to Ruth also, he indicated his assent by plucking off his shoe and giving it to Boaz. Also, we read in Deuteronomy that when the brother of a dead man refused to marry his widow she asserted her independence of him by "loosing his shoe."

Captain Kidd was born in Scotland, and took to the sea when a mere boy. In 1695 a company composed of leading gentlemen in Great Britain and in the Colonies was formed to make a business of privateering and reap the profits, which were known to be immense. The "Adventure," a galley of 287 tons, quite a large vessel for those days, was purchased, and the command given to Kidd, who sailed with two commissions, one of which empowered him to act against the French, and the other to cruise against pirates. Besides these commissions under the Great Seal, he had the ordinary letters of marque from the Commissioners of the Admiralty. The king was to have one tenth of all the booty, and the rest was to be divided between the shareholders and Kidd in certain specified proportions. A portion was to be appropriated to the crew, who were to receive no regular pay. Kidd left Plymouth April 23, 1696, captured a French fishing vessel off Newfoundland, and in July reached New York, where he remained until September, when he sailed for Madagascar, then one of the strongholds of the buccaneers. In January of the following year he arrived at the island, and in 1698 reports were abroad in England that he had raised the black flag, and orders were dispatched to the effect that he be apprehended should he come within reach. April, 1699, found him in the West Indies, whither he had gone in a vessel called the "Quidah Merchant." This he secured in a lagoon in the island of Saona, near Hayti, and re-embarked in a small sloop named the "San Antonio," for the Colonies of America. He sailed up Long Island Sound to Oyster Bay, after making a landing in Delaware Bay, and there took aboard a New York lawyer named James Emott, whom he afterward sent to Boston to the Earl of Bellamont, who had become governor of the Colonies. Emott was Kidd's advance agent, sent forward to ascertain how the privateersman would be received. While the lawyer was absent on this mission, Kidd buried some bales of goods and treasure on Gardiner's Island. To the inquiries of the New York lawyer Bellamont made evasive answers, and then later induced Kidd to proceed to Boston, where he landed July 1, 1699. Five days later, Kidd, who was examined by the Council, was sent to England, where he

was given something of the form of a trial. He was permitted to have no counsel, was not allowed to send for papers or witnesses, and was, of course, found guilty of piracy and of the murder of one of his crew, and was hanged at Execution Dock, with nine of his associates. Bellamont fitted out another vessel to go in search of the "Quidah Merchant," but news came before the search began that the latter had been stripped and burned by the men left with it by Kidd. The treasure which was secured on Gardiner's Island, with what was found with Kidd on the "San Antonio," amounted to \$70,000.

Bridge of Sighs is the bridge connecting the palace of the Doge with the state prison in Venice. It was so called because prisoners once having crossed it from the Judgment Hall were never seen again, and it was supposed that many of them were dropped through a trap-door into the dark and deep waters of the canal flowing beneath.

Scarabæus, a peculiar beetle held sacred by the Egyptians. Several mystical ideas were attributed to it; the number of its toes, 30, symbolized the days of the month; the time it deposited its ball, which contained its eggs, was supposed to refer to the lunar month; the movement of the clay-ball referred to the action of the sun on the earth, and personified that luminary. It was supposed to be only of the male sex, hence it signified the self-existent, self-begotten generation, or metamorphosis, and the male or paternal principle of nature. In this sense it appears on the head of the Pygmæan deity Ptah-Socharis Osiris, the Demiurgos, and in astronomical scenes and sepulchral formulas. In connection with the Egyptian notions, the Gnostics and some of the Fathers called Christ the scarabæus. The insect during its life was worshiped and after death embalmed.

Tammany, Society of, or Columbian Order, was formed in 1789, being the effect of a popular movement in New York, having primarily in view a counterweight to the so-called "aristocratic" Society of the Cincinnati. It was essentially anti-Federalist or Democratic in its character, and its chief founder was William Mooney, an upholsterer, and a native-born American of Irish extraction. It took its title from a noted, ancient, wise, and friendly chief of the Delaware tribe of Indians, named Tammany, who had, for the want of a better subject, been canonized by the soldiers of the Revolution as the American patron saint. The first meeting was held May 12, 1789. The act of incorporation was passed in 1805. The Grand Sachem and thirteen Sachems were designed to typify the President and the Governors of

the thirteen original States. The society is nominally a charitable and social organization, and is distinct from the general committee of the Tammany Democracy, which is a political organization.

Salutation, Forms of.—The custom of shaking hands, which is the most common among civilized nations, comes undoubtedly from remote barbarism, when two men, meeting, gave each other their weapon hands as a security against treachery or sudden attack. In the East and among the Slavic nations the character of salutations is quite different. Among the Persians, the custom of throwing one's self upon the ground and kissing the feet of the monarch prevails. In China, an inferior upon horseback meeting a superior dismounts and waits until the latter has passed. In Japan the inferior removes his sandals when meeting his superior, crosses his hands by placing the right hand in the left sleeve, and, with a slow, rocking motion of his body, cries out, "Augh! Augh!" (Do not hurt me.) In Siam, the inferior throws himself upon the ground before his superior; the latter sends forward one of his slaves to see whether the former has been eating anything, or carries with him any smell at all offensive. If he does, he is immediately kicked out without ceremony; but if not, the attendant raises him up. In Ceylon, the inferior, on meeting a superior, throws himself upon the ground, repeating the name and dignity of the latter. Among some tribes of the American Indians the custom is to salute by rubbing noses together. This form is also common in the Friendly and Society Islands, where it is returned by each taking the hand of the other and rubbing it upon his own nose and mouth. The Moors of Morocco ride at full speed toward a stranger, as if they intended to run him down, and, on arriving near, suddenly stop and fire a pistol over his head. The Arabians shake hands six or eight times; but if persons of distinction they embrace and kiss several times, also kissing their own hands. In Turkey, it is the custom to place the hand upon the breast and bow to the person saluted. In Burmah, when a gentleman meets a lady or another gentleman he applies his mouth and nose closely to their cheek and draws in a long breath, as if smelling a delightful perfume with both mouth and nose. In the greater portion of Germany it is an act of politeness to kiss the hand of a lady; but this privilege is allowed in Italy only to near relatives, while in Russia it is extended to kissing the forehead. On the European continent, it is usual for men who are intimate friends to kiss one another. The Pelew Island inhabitants grasp

either the hand or foot of the one they wish to salute and rub their faces against it; while Yemen persons of rank permit their fingers to be kissed, after long refusal.

Nihilism.—The term "Nihilist" was probably first used by the Russian novelist Turgenyeff, and was given to the party now known as Nihilists in derision, because its members sought the destruction of all existing order and government without proposing and apparently without intending to substitute any defined scheme or organization in its place. The earliest advocate of this doctrine was Michael Bakunin, who, as early as 1847, advocated a Russian republic, and in 1868 founded the "International Alliance of Revolution," a secret society having for its object a popular uprising against all monarchical governments. This society was undoubtedly the parent of the many secret organizations that have since sprung into existence throughout Europe. Though Alexander II. introduced a much more liberal policy than any of his predecessors, it came so far short of the desires of the party of progress that the spirit of discontent seemed stimulated, and the existence of a revolutionary conspiracy was proved in 1877, when, after a great trial lasting eighteen months, 135 persons out of 183 arrested were found to belong to such an organization. In 1878, when Vera Sassulitch shot General Trepoff, chief of the secret police, the Nihilists began to attract attention as a really formidable society. Her ac-

quittal was followed by a series of outbreaks and assassinations which were only checked after the Czar himself had fallen at the hands of a Nihilist assassin. The doctrines and objects of the Nihilists must be taken from the declarations of their leaders. Bakunin, in a speech at Geneva in 1868, announced that he was the bearer of a new gospel, whose mission was to destroy the *lie* at the beginning of which was God. Having got rid of this belief, the next *lie* to be destroyed was *right*, a fiction invented by *might* to strengthen her power. "Our first work," he said, "must be destruction of everything as it now exists, the good and the bad; for, if but an atom of this old world remains, the new will never be created."

Bacteria is the name given to certain forms found in animal and vegetable fluids because of their shape, and is derived from a Greek word meaning a club. They are mere points of organized matter, and constitute the lowest form of organic life. They are found in the sap of plants, in the blood of man and of the lower animals, and are abundant in eggs. They bear an important part in healthy as well as morbid processes, in the ripening of fruit as well as decay. They also exist in suspension in the air, and the festering of an open sore is occasioned by the entrance of bacteria from the surrounding air. They also act as powerful organic ferments in the transformation of starch into sugar, of sugar-cane into glucose, etc.
